America's Greatest Production Year

SECRETARY MEREDITH'S annual report puts in permanent form several facts. The first and most apparent of these facts is that the agricultural productions of the United States vastly exceeded those of any preceding year. That fact is gratifying and we are inclined to become chesty and call attention to our accomplishments.

The next fact is that "the very foundation of our nation—the stability of our agriculture—is threatened." And this because it now appears there is no reasonable prospect for fair return to the farmer for producing this magnificent crop. It is now generally considered that all the crops of the United States could not be cashed in today and give to the farmer what he has actually spent in their production.

From Mr. Meredith's report we quote:

"The corn crop of 3,199,000,000 bushels is unprecedented, representing more than four-fifths of the world's production. The sweet potato crop of 106,000,000 bushels is the largest ever produced and far in excess of that of any other year except 1919. The rice crop of 52,000,000 bushels is one-fourth greater than the largest crop ever before harvested. The tobacco crop of 1,476,000,000 pounds considerably exceeds any previous yield. The sugar beet crop is more than one-third larger than the largest ever before recorded. The grain sorghum crop of 149,000,000 bushels is 18 per cent above that of 1919, which was itself a record crop. The potato crop of 421,000,000 bushels has been exceeded only once, and then by a very narrow margin. The oat crop of 1,444,000,000 bushels has been exceeded only three times, and the tame hay crop of 88,000,000 tons only twice. The apple crop of 236,000,000 bushels has been exceeded only once, in 1914. The yields of wheat, barley, buckwheat, peaches, peanuts, edible dried beans, flaxseed and cotton are slightly below the average, but they, nevertheless, represent an enormous volume in the aggregate. The number of all classes of livestock on farms, although less than the number in 1919, exceeds by 18,214,000 the average for the five years preceding the outbreak of the European war."

Later he calls attention to the 37 per cent shortage in labor supply, with farmers facing the appalling fact that wages which in 1919 were vastly higher than in 1918, in 1920 took another enormous advance. This advance continued through seeding and harvesting time, but with the harvest came the slump in prices and the inability to cash in. The year's output, produced at abnormally high cost, was worth at current prices $3,000,000,000 less than the smaller crop of 1919, and $1,000,000,000 less than the still smaller crop of 1918.

"The very foundation of our nation—the stability of our agriculture--is threatened. The farmer must have, under ordinary conditions, a reasonable prospect of a fair return for his labor and the use of his capital. The science, the art, and the business of agriculture can not thrive unless he is suitably and profitably paid for the products of his farm—unless he receives compensation sufficient to enable him to continue to produce and to maintain for himself and his family satisfactory standards of living.

"We must adopt every feasible means to enable the farmer to adjust himself to changes in economic conditions, such as have recently occurred. It ought to be a fact that when the farmers of the country produce abundantly the consuming public will be liberally supplied with food at reasonable prices, the farmer taking his profit because of large production and the consumer receiving his increment of benefit from having available an adequate supply at a reasonable cost. In general, we should expect it to be true that the farmer's condition is improved in direct proportion to the number of bushels of wheat or corn and the number of bales of cotton he produces. It frequently happens, however, that when all farmers have extraordinarily good crops during the same year low prices leave him —(Continued on Page 11.)

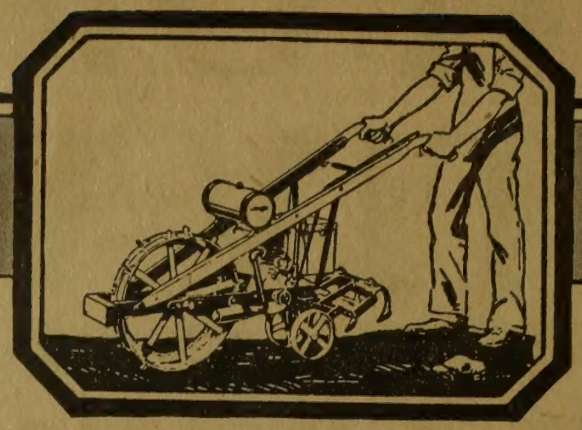
SPRYWHEEL



"Multiplies Manpower by Five- from Seedtime to Harvest"

The $150 Tractor F. O. B. Boston

Why Every Farmer and Gardener Should Use a SPRYWHEEL

Thorough cultivation is the first essential of good farming. Sprywheel was designed to eliminate the drudgery and awful cost of hand hoeing. The Sprywheel won't do everything from breaking new ground to grinding grain, shredding corn, sawing wood and cultivating onions. We don't know of any machine that will do all of these jobs equally well.

But Sprywheel will do any work a hand or wheel hoe can be used for—and it enables one man to do more and better work than any five men pushing hand tools.

Sprywheel practically eliminates hand hoeing, just as the McCormick harvester ended the old, laborious, back-breaking method of harvesting with sickles and scythes. That is how it "multiplies man power by five from seedtime to harvest". That is why every farmer and gardener should use a Sprywheel.

The market gardener knows

how hard and expensive it is to get help for hand hoeing. He knows the necessity for timely cultivation. The market gardener often attempts to overcome the excessive cost of hand hoeing by spacing the rows wide apart so that a horse-drawn cultivator can handle most of his cultivating work. Or he cuts down his acreage. Both are wasteful expedients on high priced, fertile land.

Using Sprywheel, rows can be planted so close together that the plants have just enough room to attain maximum size. Every row can be cultivated as often as necessary. Profits per man and per acre simply multiply.

The half acre home gardener

often limits the size of his garden patch because of the difficulty of getting the cultivating done, doing it himself, or finding time to attend to a garden and at the same time keep the lawn in presentable condition. Sprywheel solves his problem.

Besides all kinds of cultivating tools for weeding, mulching, hoeing and hilling, there is the Sprywheel Lawn Mower Attachment. It can be attached in less than five minutes. It converts the Sprywheel into a *power lawn mower* remarkable for sturdiness, simplicity and effectiveness. Reduces handling a large garden and keeping extensive lawns properly cut to a simple matter of an occasional half hour's work.

For farmers who raise staple crops

—tobacco, cotton, peanut and corn growers, sugar beet farmers, etc.—the Sprywheel is quite as valuable. After the plants have grown high or spread into the rows so that multiple row cultivators can't be used or horses put in without damage, Sprywheels provide continuous cultivation at the very time cultivation is most necessary.

The value of continuous cultivation has been convincingly proved on scientifically managed farms. Yield has been increased to show four hundred percent profit on the cost of continuous and late cultivation—even when the late cultivation was done in the old expensive way—with the hand hoe. The additional cost of the extra cultivating with Sprywheel will show profits far in excess of the cost of the work and the machine itself.

Cost of Sprywheel operation

One gallon of gasoline keeps a Sprywheel running all day. Enables one man to cultivate fifteen miles of wide, single row,—considerably more with the two or three row attachments which can be used while the plants are small, when rows are planted close together. The accompanying letter is one out of scores we have received. Read it.

"The Best Money-Maker a Market Gardener Ever Had Offered"

Messrs. H. C. Dodge, Inc. October 21, 1920
Boston, Mass.

Gentlemen:

After having used the Sprywheel during the past season on our market garden of one hundred and twenty acres, I want you to know that it has performed its work in a splendid manner.

The problem of the market gardener, as I look at it, is to *get the work done at the right time.* This has always been difficult with hand labor. Your Sprywheel does so much work in a short time that today the problem is simple. Not only does the Sprywheel excel as a weeder, but it also stirs the ground more thoroughly than hand labor and very much faster.

In my opinion the "Sprywheel Tractor" is the best money maker that a market gardener ever had offered to him.

Very truly yours
J. W. RUSSEL, Jr.

One Wolcott Road
Winchester, Mass.

A Selling Franchise You Will Approve

The Sprywheel Dealers' Continuous Exclusive Territory Franchise protects the dealer against invasion of his exclusive territory. It protects him against loss through price changes. It guarantees liberal advertising in each dealer's territory. It provides the fullest cooperation by the manufacturer in supplying expert demonstrators and sales helps.
In short, the franchise is worked out so that every dealer has every incentive possible to give every farmer in his territory the best service and the strongest cooperation that has ever been given with an agricultural implement.
We believe that the plan for merchandising the Sprywheel and assuring to every farmer the utmost in dealer cooperation is as big a step forward in merchandising as the Sprywheel itself is in design.

To the dealer who wants to cooperate

The market for Sprywheel is immense. An exclusive Sprywheel dealership will be extremely valuable. Write today for full particulars regarding the Sprywheel Dealers' Continuous Exclusive Territory Franchise. Now before someone else gets your county.

Hints on Planting Trees

By Wm. R. Wood

AS the planting season again approaches we may expect to see the usual amount of mistakes made by those new or inexperienced in horticultural pursuits. These mistakes, in a way, help the nursery business, in that they cause an untold loss of trees which have to be replaced, sometimes, three or four times before they are made to live, thus increasing the demand for trees by just that much.

On the other hand, the nurseryman is quite often blamed, and while he may occasionally be to blame, the trouble usually lies with the planter, for no matter how explicit are the instructions given, few new planters realize how important it is that these instructions be followed—until they have lost one or two lots of trees. The novice usually prefers to take advice from everyone else rather than from the man who sells him the trees and whose advice should be the most reliable.

These conditions apply more particularly to the small planter, the man who is planting out a small home orchard. Occasionally, however, we find men planting five or ten acre tracts in a careless and slipshod manner, but the commercial planter, if he is not a practical man, generally employs an experienced planter to do his work and see that his trees are started off right. Again, we have seen trees planted with all the care possible to give them and then allowed to die from neglect, the owner seeming to think that no further care or attention was necessary. Others kill their trees with kindness. They overfeed, overwater and overcultivate. They burn the roots with too much fertilizer, sour the soil by excessive watering and by continually digging around the trees prevent them from forming new rootlets.

I mention these conditions for the reason that a great many people go to extremes either one way or the other, and the average person is not content to follow a happy medium, using just good common horse sense and reasoning out their problems as they go along.

The writer well remembers his first experience in gardening. It was at about the age of six years. Mother gave me a handful of beans and explained how each bean, if planted, would grow into a vine that would produce many more beans, so in my childish mind I figured that it would only be a short time until this handful of beans would grow into tons of beans; so, after getting planting instructions, I hastened to the garden and planted my crop. Early the next morning I proceeded to dig them up to see what progress they were making; again in the afternoon, and the morning of the following day.

Not being able to detect any change, I took them in to mother, who proceeded to explain to me that they never would grow unless I left them in the ground undisturbed for a number of days. Again I planted them and proceeded to forget all about beans, and whether they grew or not I never knew, as I had gotten over my enthusiasm and other important matters were demanding my attention. This is too often the case with garden planters. We are very much enthused to start with, but just as trees or plants get to the point where they need our undivided attention we find other things calling us and they are forgotten.

There are, however, a few general points that I wish to make clear to those not familiar with tree planting. These relate to soil condition, planting and care of trees and plants both during and after planting. First of all have the ground in a good state of tilth. It should be well plowed or spaded up and cleared of noxious weeds. It is better to delay planting the orchard for even a year than to plant in foul ground. It is possible to clear vacant land of noxious weeds, but once planted to orchard the best that can be done is just to hold them in check by constant fighting.

If the orchard is to be irrigated, be sure that the land is graded so that water can be run without difficulty to every tree in the orchard. This is another very important matter that should by all means be attended to before the trees are planted, as it is next to impossible to grade land after the orchard has been planted on it.

Having prepared the land and staked it off for planting, the holes should be dug deep enough and large enough in diameter so that the tree roots can be spread out about as they grew in the nursery. Some planters recommend putting a little fertilizer in the bottom of the holes, but if this is done do not fail to cover it with earth so that the young tree roots will not come in contact with it until after the tree has become somewhat established. When placed so that the roots come in direct contact with the fertilizer it is very apt to burn them, thus doing much more harm than good. Well rotted stable manure is about the best fertilizer for this purpose and should be placed deep enough so that four or six inches of soil can be placed between it and the lowest roots.

In planting set the tree as near as possible the same depth as it stood in the nursery and spread the fiber roots as the soil is filled in so that they will be in as near their natural position as possible. Water should be applied to settle the soil around the roots. In planting deciduous trees it is customary to just pack the earth around the roots by tramping it well with the feet, but where it is possible to get water it is advisable to settle the soil with water. This is much more essential with late spring planting.

Always be careful to protect the roots from the wind and sun while planting. With deciduous trees planted in the winter or early spring while they are absolutely dormant it is not necessary to be quite so particular. However, they should never be exposed long enough for the roots to become dry, and it is much better at all times to keep the roots protected and only take the trees from the package as they are planted.

Deciduous fruit trees should be cut back as soon as planted to 18 or 20 inches above the ground. Under no circumstances should the entire top be left on, as they do not make as satisfactory a growth and will never make a uniform and compact head that will hold a crop of fruit when the tree comes into bearing. Citrus trees are usually headed at the proper height before leaving the nursery and do not require any further pruning when planted.

Some form of protectors should be put on the trees as soon as planted to protect them from becoming sunburned before they make sufficient top to protect themselves, also to prevent damage from rabbits and squirrels.

The failure to put protectors on newly planted trees causes an annual loss much greater than most people realize.

Do not fail to hoe around the newly planted trees, especially where they have been irrigated. This prevents the soil from crusting over and cracking around the trees and letting the air down into the roots. It also enables the tree to go considerably longer before another irrigation is required. Too much water, especially on heavy soil, is not desirable, and by forming a fine mulch of well pulverized soil around the tree the water requirements are reduced.

The normal rainfall is usually sufficient to furnish the necessary moisture for deciduous trees which are generally planted during the first three months of the year, but citrus and tropical trees, which it is necessary to plant later in the year when the weather is warmer and the rainy season is practically over, should be irrigated every ten days or two weeks until they are well established, and after that an irrigation once every month or six weeks will be sufficient provided the soil is kept well cultivated between irrigations.

In conclusion, I would remind the beginner that there are no hidden mysteries to solve or unseen charms to bestow in connection with the growing of trees. A fair supply of common sense coupled with good judgment and a willingness to apply the necessary toil will usually succeed, remembering that "eternal vigilance is the price of success" in this as well as all other lines of endeavor.

Dates in the San Joaquin

THE Coachella Valley, on the edge of the Colorado desert, has proven its adaptability to date culture. It is proving not only its possibilities as to growth and as to production, but also as a commercial success. But can the industry be made a success in other sections of California? W. R. Nutting of Fresno insists that it can. And we are able to give on this page an illustration which shows a crop of exceptionally high quality dates. This tree has grown for years within some five or six miles of the city of Fresno. Until Mr. Nutting proceeded to pollenize it the tree bore practically no fruit. This last season care was taken that pollen should be brought from other trees, and the result has been several full bunches of the fruit, as may be seen in the illustration.

Not content with experimenting with the few palms which have been planted in former years, Mr. Nutting has been planting an extended acreage of the best seed which could be secured. The seedling plants have grown thriftily and promise liberally. Mr. Nutting is now, so far as possible, distributing these seedling plants to different parts of the San Joaquin Valley, and by this means he hopes that the Nutting date idea may become established and a great San Joaquin Valley industry be built up. Writing of Mr. Nutting's work, Roy E. Miller, editor of The Associated Grower, says:

(Continued on Page 11.)

W. R. Nutting and the Fresno Date

Agricultural News Notes of the Pacific Coast

Northern California

Colusa reports 1,000,000 bags of rice in local warehouses.

During 1920 there were 60,000 Bartlett pear trees planted in Lake County.

The average rainfall at Lake County points up to Christmas was more than 25 inches.

The Lodi district is estimated to have shipped grapes to the value of $17,694,500 during 1920.

The rainfall at nearly all points in Central California exceeds the normal to date by about two inches.

The marketing department of the Glenn County farm bureau has been reorganized and incorporated.

County agricultural agent is the name officially substituted for county farm adviser in Butte County.

A Sacramento firm expects to build a cannery in Chico, Butte County, in time to care for the coming crop.

Through the farm bureau Glenn County farmers are organizing a "Farmers Mutual Fire Insurance Company."

The Enterprise district, across the river from Redding, Shasta County, is planting heavily to table grapes on non-irrigated lands.

At the end of the sixth week in the egg laying contest at Petaluma the highest pen recorded 238 eggs; the leading hen, 36 eggs.

The famous Hearst home near Pleasanton, Alameda County, is to be acquired by the Royal Order of Moose for an old folks home.

Reclamation District No. 70, Colusa County, will spend $300,000 on improvements before next season's use of irrigating water begins.

Large numbers of celery growers in the Sacramento delta region on account of low prices have abandoned their crop and turned to raising hogs.

Plenty of grass for sheep in the Livermore Valley, Alameda County, has brought the price of corn down to $35 a ton. A year ago it was $80.

Livestock men of the section about Woodland, Yolo County, are planning at a meeting to be held in January to form a local association of livestock men which will put Woodland on the map as a pure bred center.

Yuba County stockmen attended the meeting held at Reno, Nevada, December 17 and 18, where supervisors of the national forest and cattlemen discussed changes which the livestock men of California want made in the rules governing grazing of national forests.

Col. Birsch, director of the proposed experiment station and 5,000 acre demonstration farm at Mosul, Mesopotamia, has been visiting the university farm at Davis to study new cereals, and he will return to Mesopotamia with seed of Mariout and Four Thousand barley and other grains which have been proved profitable by our state station.

The number of horses, cattle, sheep and goats grazed on the ranges within the El Dorado national forest shows a decided falling off from last year's figures. According to Forest Supervisor E. F. Smith this is due to the withdrawal from the stock business of several small raisers, who, owing to market conditions, have found it unprofitable.

Central California

One of the state's largest turkey ranches is at Dos Palos, Merced County.

A canning firm at Selma, Fresno County, is planting 4,000 acres to asparagus.

Lindsay, Tulare County, has shipped 1,564 cars of oranges for the season closing at Christmas.

A thousand acre ranch four miles east of Clovis, Merced County, is being planted to vines and figs.

Clovis, Fresno County, has already received for shipment more than 200 tons of figs, and still they come.

Gates is the name of a new town being built in Kern County, where a recent strike in oil brought scores of settlers.

Warren P. Tufts of the state farm at Davis will conduct four pruning demonstrations in Stanislaus County, January 16-17.

Fresno grape growers are moving for a special state appropriation to be used in control of grape mealybug and black mildew.

The directors of the California Peach and Fig Growers have decided to hold a two day fig institute at Fresno, January 7-8.

Several hundred acres of Thompson Seedless grapes are being put out on a new tract in Madera County, about 20 miles north of Fresno.

Porterville, Tulare County, reports a probable brick and tile plant on the Springville road, where a valuable clay deposit has been unearthed.

The University of California has selected the Burt oats as the best variety for the San Joaquin delta region, out of 100 varieties experimented with.

Grape growers are signing up for the 1921 crop and some Santa Clara vineyardists are to get the enormous price of $150 a ton for wine grapes.

A packing house manager at Watsonville says that during the week preceding Christmas 200 boxes of apples daily were sent out on orders as Christmas presents.

The Stanislaus County Fair Association met at Modesto last week and accepted architect's plans for fair grounds, and Modesto will hold her first big fair about September, 1921.

The West Stanislaus Irrigation District has been organized with Crows Landing as headquarters. The district will cover about 30,000 acres, and it is hoped to have matters in hand so as to issue bonds within a short time.

San Joaquin Valley reports thousands of workers coming from Eastern sections, and several of the larger towns have erected buildings to provide housing for the unemployed. Fresno is urging the larger cities to care for their own rather than send into the valley at the present time.

Announcement of new scales of wages for laborers and pruners has been made by the Valley Fruit Growers Association. Ranch laborers and teamsters will receive $2.50 per day and board under the new scale, which is a reduction of 50 cents per day. Ranch laborers and teamsters, per month, $60 and board; scraper men, $2.75 to $3; tractor men, $3.50 per day and board. The hourly wage scale is 50 cents per hour for Americans, 45 cents for Hindoos, Japanese and Mexicans.

Southern California

The Oxnard city council has decided to have a civic center and free auto park.

The Citrus Institute will hold a two day session in San Bernardino, February 25-26.

During the 1920 season 17,000 acres of citrus trees in Los Angeles County have been fumigated.

There is a proposal to build a $15,000,000 dam in San Gabriel canyon to secure water for irrigation and power.

The Riverside-Arlington Heights Fruit Exchange finds abundance of labor available for picking and packing.

The Covina Orange Growers Association has decided to establish a cooperative fumigating and spraying department.

The ranchers in the Moreno Valley, Riverside County, have just completed the purchase of the local water system at a cost of $91,500.

At the recent annual meeting of the Los Angeles County farm bureau at Santa Anita Robert H. Neely of Puente was elected president.

Farmers and dairymen of San Bernardino County will hold a four day "Farmers Short Course" at the San Bernardino high school, February 7-11.

A one day dairy course under the guidance of the state department of agriculture will be given at farm bureau headquarters, Riverside, January 7.

Los Angeles County has purchased ten acres at Altadena and will establish a nursery for the growing of trees for planting in burned over mountain areas.

Residents of the Ojai Valley in Ventura County will dam the Ventura and Matilija Rivers to provide the valley with an ample supply of irrigating water.

Manager Churchill of the California Lima Bean Growers Association reports 760,700 sacks Limas in warehouses on December 1; 248,600 sacks Baby Limas.

About a dozen cotton growers of Coachella Valley have agreed to grow Acala cotton to produce certified pure seed under direction of the state department of agriculture.

Forest officials report that there have been discovered many cases of removal of young pine trees planted in the Angeles forest. The forest service is taking steps to see that these young trees are protected.

It is announced that the Pacific Mail Steamship Company will put on combination freight and passenger carriers from San Francisco to Manila and East India, the ships being particularly designed to care for fruits.

Delegates from all parts of the valley met at Coachella on December 15 and organized the Associated Coachella Valley chamber of commerce, to which any member of local chambers will automatically become attached.

The Boy Scout movement is popular in Orange County, Three hundred and forty boys are now organized into Boy Scout troops and it is hoped to have 700 enrolled before the summer camps are opened. Ann[illegible]eeting will be held December 3[illegible]anta Ana.

The Coast and General

An irrigation institute was held at Ellensburg, Washington, December 16, 17.

The Washington County farm bureau is conducting a cost-of-milk production project.

One canning company at Talent, Oregon, has shipped out 200,000 gallons of apple juice.

Spokane County, Washington, claims 1,200 of its 4,800 farmers as members of the farm bureau.

A $50,000 sale of hides in one lot was recently made by the new packing company of Phoenix.

Roseburg, Oregon, expects to show as large an apple crop as last year, in spite of adverse weather conditions.

Rudolph Kuchler has been appointed land commissioner in Arizona and will begin his duties shortly after the first of the year.

The Farmers Union has reelected Chas. S. Barrett of Union City, Georgia, president for his fifteenth consecutive term.

The Washington and Idaho Wheat Growers Associations held mass meeting at Spokane, December 13, to discuss cooperative marketing.

Attempts to lower the price paid to pickers in Arizona cotton fields below four cents at the beginning of the season failed. The pickers continue to receive the full amount.

Work on the Hassayampa bridge at Wickenburg, Arizona, will begin very shortly. This bridge is on the main highway, mostly traveled at this time by Phoenix to Los Angeles tourists.

The farm bureau of Jackson County, Oregon, has a marketing exchange which is handling practically all the livestock of members and making purchases of spraying materials and implements.

President Wilson of the Washington Federation of Farm Organizations called a meeting of all producers of the state at Spokane on December 20 to discuss legislation that will come up at Olympia next month.

Stock raisers of Arizona have lent enthusiastic aid to the poisoning of predatory animals on the ranges as conducted by the biologicl survey of the federal government. This work, they say, will save them thousands of dollars in sheep and young calves.

The agitation of the matter of planting the Delta variety of cotton in the Salt River Valley of Arizona has resulted in some anxiety on the part of those who wish to maintain the purity of the Pima seed. Owing to the quarantine regulations which prohibit the bringing in of seed from outside districts it is not probable that there is any danger of hybridizing the Pima seed from this source.

Advices from England are to the effect that the Liverpool and Manchester spinning districts have used a sufficient amount of the Pima long staple cotton that they are considering the use of this on a larger scale. There were 6,000 bales shipped recently and 10,000 more are to follow shortly. It is believed that when conditions become somewhat more normal their use of Pima cotton will have a tendency to stabilize the market.

The Boll Weevil in Arizona

By A. W. Morrill

THE recent discovery of the boll weevil in cotton fields near Tucson, Arizona, while not unexpected on the part of those familiar with the Arizona situation, is an important event in connection with cotton culture in the Southwest. The insect is the variety of the boll weevil which normally lives in certain mountain ranges in southern Arizona, where it infests a species of wild cotton known to scientists as Thurberia thespesiodes. This Western variety is almost identical with the Eastern boll weevil, with which it is capable of interbreeding, but it

Cotton Boll Weevil
Side and top view of adult cotton boll weevil. The Thurberia, or wild cotton boll weevil, differs only slightly in form from the Eastern variety shown above.

is evidently much better adapted to hot, arid conditions found in southwestern cotton districts and therefore more to be feared as a cotton pest in Arizona and California.

Adaptations to Southwestern Conditions

One of the most important adaptations of the Western weevil is shown by its remarkable length of adult life as compared with the Eastern variety. The latter has been known to live without food or water for 192 days, whereas the former has a record of 625 days without food or water. Even when fed the Eastern variety has a record of only 335 days. This record of the maximum longevity of the Thurberia weevil was sent to me by Dr. W. D. Pierce, formerly of the U. S. department of agriculture, who reports having records of several individuals which lived for more than a year without food or water. With such records before us we are not justified in assuming that these insects hibernate exclusively inside the seed pods or bolls of the food plant, as was at one time supposed. In fact, it seems certain in consideration of Dr. Pierce's records that Thurberia weevils, which reach maturity and emerge in the summer and fall, are very likely to hibernate successfully. The eradication of the pest in fields of cultivated cotton is therefore, in all probability, not as simple a matter as believed heretofore.

The majority of the individuals of the Eastern boll weevil hibernate outside of the cotton fields in Spanish moss, corn shucks and other materials which furnish attractive shelter. Many, however, pass the winter in cotton bolls. In one instance it was estimated that there were more than 10,000 specimens of boll weevil per acre in cotton bolls. The Western variety apparently is especially adapted for hibernation in the bolls of the food plant. This habit might not persist in the same degree in cultivated cotton as prevails in the mountains. In general information in regard to the hibernation of the Thurberia weevil is very meager.

A third point of interest in connection with the adaptations of the Western weevil to arid conditions is that the insects have shown a preference for bolls of the food plants for egg deposition. The Eastern weevil attacks the squares or buds almost exclusively as long as the supply of uninfested squares holds out. This gives an opportunity for climatic control to check the multiplication of the insect. The infested squares usually fall to the ground, where many dry out, with the result that the weevil is killed by heat or does not have a suitable food supply and starves. In hot, arid sections the Eastern form of the boll weevil is greatly handicapped by its preference for the squares, as the mortality of the larvae in the fallen squares is excessively high. The bolls, however, do not, as a rule, fall when attacked by the weevil, and the larvae in this case are not affected by the most excessive heat. The critical stage in the life history of the weevil is thus safeguarded to the extent that bolls are preferred over squares for the deposition of eggs.

Complications in Arizona Wild Cotton Problem

The wild cotton situation in Arizona is a complicated one. The Thurberia plant normally occurs in the mountains, but seed are brought down by water and seedling plants are sometimes found in the valleys many miles from the natural habitat. Although the wild cotton is a perennial, plants more than a year old occur only above 2,500 feet elevation, as a rule. The distribution of the plants in the foothills indicates that seed brought down by water is more likely to be left near the mouths of the canyons where the canyon beds spread out into sandy or gravelly washes, than farther down in the low lands. It is generally recognized by those who have given any attention to the problem that infested bolls of the Thurberia or active weevils brought down by water from the mountains are more likely to be deposited or liberated within a comparatively short distance of the mouths of the canyons. The water supply from the canyons becomes more and more undependable the farther away from the canyon mouth one goes. This is due to the absorption of the water in the gravel beds. Naturally, therefore, the water transported weevils are liberated in greatest numbers in the foothills, and it follows that a food supply should be maintained in the foothills, particularly near the mouths of the canyons, as long as the weevils exist higher up in the mountains. Otherwise these water transported weevils are forced to fly in search of food, endangering cultivated cotton.

The Thurberia weevil normally flies very little, but is undoubtedly capable of flying long distances if necessary in search of a food supply. The Eastern boll weevil in its progress from southern Texas to the Atlantic Coast demonstrated its ability to cover 40 miles without difficulty, and one season when cotton fields were scattering it progressed 120 miles. The same season in another section where cotton fields were almost continuous the insect moved only 20 miles into new territory. The Thurberia weevil, fortunately, has been provided by nature with an abundance of food in the mountains and there is no reason to believe that under normal conditions migrations take place. Water has been recognized as the most important danger, and as indicated above, the weevils thus transported are most likely to be left near the mouths of the canyons.

The wild cotton situation is particularly complicated by the presence of a second potential pest of cultivated cotton known as the Thurberia or wild cotton bollworm. This insect since 1913, when it was first investigated by Dr. Pierce of the U. S. department of agriculture and the writer, has been regarded as of as much importance as a potential enemy of cultivated cotton as the boll weevil. This pest in the adult stage is a moth presumably capable of flying long distances. The eggs are deposited on the wild cotton plants during July and August. The larvae or worms feed on the bolls and when full grown they go into the ground, where they transform to pupae and remain until the following summer. They begin to go into the ground at the lower elevations about September 1 and from this time until the adults emerge several months later the destruction of the food plants would force a migration of the moths in order to find plants upon which to lay their eggs. In fact, there is nothing that could be done that would more certainly force a migration of these insects and thereby endanger cultivated cotton than the destruction of the wild cotton when the insects are in the ground. The Thurberia boll worm moth belongs to a group of notoriously strong flying insects, and if driven from its natural habitat by a shortage of food from any cause, no cotton growing district within 500 miles would be beyond its possible range.

If there were no other insects than the boll weevil to consider and if all the wild cotton on an entire watershed could be completely eradicated, the period when this could be accomplished without danger of scattering the adults would be, obviously, during the season when the insects are not on the wing. Eradication work should not be started, therefore, until after the first killing frost. The average date of this in the cotton districts of southern Arizona is late in November, and at Tucson is on November 24. However, unless all the plants on an entire watershed could be destroyed beyond all doubt, leaving no debris in which weevils might survive, the natural growth of wild cotton at the lower ends of the canyons and in the foothills should be left as a trap to attract the adults brought down by water from time to time from the higher altitudes. Logically, considering only the weevil, any attempt to eradicate wild cotton should begin at the tops rather than at the bases of the mountains. The complication introduced into the problem by the bollworm, however, makes it utterly impossible to carry out any wholesale destruction of the wild cotton plants over any large area without forcing one or the other of the two major wild cotton pests to migrate. Eradication of the plants must be recognized as a secondary consideration. The insect pests must first be eliminated. If the wild cotton plants are reduced in number unwisely an overcrowding and forced migration of pests may result.

Destruction of Wild Cotton Near Tucson

Shortly before the middle of October, 1919, the Arizona authorities, believing they were acting for the protection of cultivated cotton, began the attempt to eradicate wild cotton in the foothills of the mountain ranges near Tucson. The work was done by Mexican laborers equipped with picks and bars, the plants being pulled or dug up and burned. The month of October being one when adult weevils are active and the majority of the bollworms being then in the ground, it is evident that a time was selected to begin the work when maximum damage would result by forcing then or at some later period the migration of two destructive insects from the area involved. In fact, if the two mild cotton insects here mentioned had been beneficial and the purpose was to drive them to cultivated cotton, the most effective plan would be to eradicate the natural food plants in the foothills and lower ends of the canyons, beginning in October and ending, if possible before frost. It is obvious that a more or less general and widespread infestation of cultivated cotton in Arizona during 1920 was inevitable. To a large extent this danger might have been averted by maintaining a supply of trap plants for the two wild cotton pests in the foothills, as advised by the writer. This would have meant in effect replanting the wild cotton in the foothill areas. By subsequent attention to these trap plants and destruction of the insects which appeared on them, if necessary, maximum protection to cultivated cotton, under the circumstances, might have been secured. Under normal conditions infestation of cultivated cotton might have occurred with the chances in the writer's opinion about ten to one against it. With the wild cotton plants eradicated in the foothills the chances of an infestation were evidently changed to more than a thousand to one in favor of the infestation. If a hay stack burns when a lighted match is applied to it there is little use in attempting to explain the conflagration as possibly due to spontaneous combustion.

Several months ago, having determined that the situation in Arizona was one which seriously menaced Arizona and California cotton interests, I secured opinions on the matter from several disinterested entomologists of high standing in the profession. All of these agreed that the destruction of the wild cotton plants under the circumstances, without suitable provision for trapping the two potential pests, was a serious blunder likely to result in great and perhaps irrepar-

Host Plant as it Grows in Arizona
Typical location of Thurberia plant, below rock, in Agua Caliente Arroyo, Arizona, about one and a half miles from the mouth of the canyon.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EDITORIALETTES

Today is the day for making good resolutions. We admit it is rather of an old fogyish proposition, still we have heard something like this, that he who makes no resolutions, makes nothing. We may be slightly inaccurate in our quotation, but sufficiently near to convey the meaning we wish. Yes, we think that if one will sit down and formally take stock of his own mental and moral make-up on this first day of the year he will find possible loophole or weakness apparent somewhere which will make it advisable to take his pen in hand and "Hereby Resolve" to correct the aforesaid weaknesses. The wise merchant takes account of his stock and knows at the end of each period of a year or six months his exact standing. The wise farmer looks over his cash book, number of head of livestock, number of bushels or tons of products on hand and soon determines that he is better off—or possibly worse—than a year ago, same date. We may take the same precautions with our innermost or personal life, or, at least on one day a year, "take stock" of ourselves. Likewise on the material side, especially this year when there seems to be a bluish tinge over everything with which the producer has to do. It is barely possible he will find a certain number of tons, boxes or bushels of produce which has cost, say, one dollar to produce, which the market declines to consider at 75 cents. This calls for some long and most serious thinking, which it is probable will result in a resolution to hold until a reasonable price can be secured and save him from ruin.

* * *

Once made, such a resolution develops a number of obstacles, and in this it is not unlike various other New Year resolutions. How is the family to live while a non-productive crop, ready for market, rests in the bins, or, in the case of livestock, eats its head off? Serious thinking may develop the fact that credit is still good and must be used. As a rule, we believe bankers are endeavoring to aid in handling this situation. Possibly at times they are not just, but this the farmer can soon determine.

* * *

Now should enter another factor in the resolving business, and, as suggested in another column, it has to do with closer cooperation. If the Cultivator could say this loud enough so that every farmer in California could realize the truth of "Stick together or we are stuck"—which has become one of our cooperative slogans—and make that slogan or a similar one a resolution for the New Year, we believe one long step in securing justice for the food producer would be taken.

* * *

But we fear that, as in the past, too many cooperators are content with being merely passive cooperators, that is, entirely willing to have others cooperate with them. Make cooperation a real, live thing by insisting upon the opportunity of cooperating with others.

* * *

Come back to the farm and make one or two resolutions there: "I will fix the broken fence, mend the drill, sharpen the plow, remove the baling wire toggle and have the harness practically repaired, paint the old wagon—paint saves wood—, be kinder to Old Mooie and Prince and even the tractor, buy my wife a washing machine, and appreciate the fact that running water and a few other labor saving conveniences in the kitchen will make more efficient work in every department of farm activities."

* * *

Many a day has started wrong and continues wrong because of impossibility of rendering efficient service in the kitchen at breakfast time. We have seen some kitchens which make us wonder how life is endured by those who make it kitchen, dining room, living room, all combined, with hardly one appliance which makes it a real home. This isn't good business.

* * *

We have hardly started with the resolutions which are possible with the well regulated farmer, but let us suggest finally the unwisdom of resolving not to resolve. Make New Years 1921 a milestone.

* * *

O yes, we might suggest one more resolution. Let us resolve to pay our income tax with good nature. A farmer who so schools himself as to be able to pay his taxes in a year like this with good nature is certainly worthy of highest commendation, and, had you thought, there is nothing to be gained by grumbling, even at taxes? It may be well to make another resolution to quietly keep our eyes open and see wherein the voracious appetite of the tax eaters may be curbed. But don't grumble; that neither hurts the other fellow nor helps the cause. Get busy and—well—cooperate.

* * *

If an orchardist is intending to plant a tree, he should read Billy Wood's article on Page 3. That article bears the very modest head, "Hints on Planting Trees," but even the orchardist who has planted a tree before may still catch from these hints sufficient to avoid a mistake, and a mistake in planting a tree may possibly never be corrected. Lots of planters lack vision as to the size which is to be attained when the tree reaches maturity or as to the needs of the tree for sunshine and water. Trees planted by people who lack vision soon perish.

* * *

Furthermore, it's a good year to resolve to plant more trees. Another case of lack of vision is shown by the effect of one season's market depression on the planting of a crop which requires years to mature. A temporary slump will, we hope, be entirely forgotten by the time trees of 1921 bring in their first crop. In any case, don't allow the one year's situation to discourage the extension of permanent industry.

* * *

Be sure and note Mr. Wood's concluding paragraph. We mean what he says about "hidden mysteries," "unseen charms," "eternal vigilance," "good judgment" and, yes, there is something about "necessary toil."

INDEX

Only a short time ago a subscriber wrote most urgent appeal that the Cultivator should put into its household department so much of interest that the wife and children would not destroy but would aid in preserving the paper. We fear this subscriber has not been noting the most interesting material which has been given in that department. During the past year there have been a number of original stories written for the Cultivator and a world of home experiences with recipes tried in California homes and passed on to Cultivator readers. Some of the interesting things which have appeared there have been made of permanent value by being paged in the index on Pages 846 and 847 of last week's number. The home maker who will turn to that index will find there suggestions as to peeling peppers, making washing fluid, canning beans, making olives out of cherries, drying sweet corn, making olive oil and even avocado ice cream. All told, there are some three or four score of these items of interest to every home maker. We mean that number were indexed; of course, there are a great number which were not.

But there are about ten other columns of the same index material, making of highest value the preceding 26 numbers of the Cultivator. The 848 pages printed since July 1 were filled with matter which justifies our subscriber in his appeal to so arrange the paper that it will be preserved and kept in orderly manner. This is the first of January and this is the first issue of the New Year and of the new volume. Put a shelf up over the window or at some convenient place, and once the paper is read, file it.

To give force to this New Year resolution to save this valuable material for second or third use, we hope a few numbers covering the last three or four months, which may still be about the house, may be gathered together and inspection made of some of the exceptionally fine articles which have been appearing. They are worth saving, Folks, honest they are, and you will appreciate this more fully at the end of the next year, for we are going to give the biggest dollar's worth Cultivator readers ever got.

Then here's a suggestion as to one other, perhaps the most valuable of all features in the Cultivator. This is the advertising. There is no type of questions comes to the Cultivator so often as "Where can I buy ——?" These questions are usually answered by simply clipping ad copy from former Cultivators and mailing to the inquirer. It takes time to write a letter, stamp and post, and wait for mail reply, much more than it would to take down a file of the paper and secure the answer in one's own home. Many of our readers do not appreciate the full value of the reading matter that appears in advertisements. A well written ad sometimes contains more information than an encyclopedia, at least on that particular topic. The work of a good modern ad writer is worth preserving.

But about the index, don't forget there will be another in the last issue of Volume LVI, June 25, 1921.

WILD JUSTICE

It was with a great deal of interest and satisfaction that I read your editorial in a recent issue of the Cultivator, entitled "Wild Justice." You have expressed my views to a T.

Your paper is—pardon the comparison — like good whisky — improves with age.

Wishing you continued prosperity, a Merry Xmas and a Happy New Year, I am yours truly, T. R. Brown, San Bernardino.

Astonishing as it may seem, there appears to be a vast number of people in this state with the same opinion as our San Bernardino subscriber. We Californians have dropped into a feeling of smug content with things as they are, without stopping to realize to what length our indifference may lead us. Lack of strict law enforcement is even considered a virtue in some sections, and we even send to the murderer's cell bouquets and consider his promise to be good hereafter sufficient to secure for him probation or at least release from the extreme or sufficient penalty. Lots of pussyfoot stuff has been mistaken by some sentimentalists as a manifestation of the true forgiving and Christian spirit which will lead to the upbuilding of society. As a matter of fact, it is quite the reverse, and if healthy respect for law and order is to be created it will have to be through return to following the principles of the good old Mosaic law which has stood the test of centuries and the new dispensation was the fulfillment, not the destruction of that law.

We fully appreciate the commendation of our San Bernardino subscriber unless it be his up-to-date comparison. Just at present moonshine is depreciating fearfully in selling value. We will endeavor to follow the example of the other kind and improve with age.

About 15,000 Mexicon cotton pickers have been engaged in harvesting the crop of cotton in the Salt River Valley of Arizona this season. These have come very largely from the Mexican states of Sonora and Sinaloa. They were brought in on a special permit of the department of labor, under bond, and will be returned to Mexico when the season is ended.

Meredith Makes Recommendations

A bit of the serious side of American agriculture is shown on the cover of this issue in a few very short quotations from the report of Secretary of Agriculture Meredith. It may not be quite as serious as would appear from first reading, but the present agricultural situation calls for serious thought on the part of people other than those who are caught with big production harvested without capital to carry until market conditions permit securing part of the cost of production. Other recommendations given in the merest outline from Secretary Meredith's report are as follows:

Studies in the cost of marketing so that the proportion of the consumer's price received by the producer and the proportion received by various marketing agencies can be ascertained.

Extension and development of cooperative marketing work.

Establishment of a world market reporting service to make promptly available comprehensive and dependable information as to production, supply, prices of, and demand for agricultural commodities in different parts of the world.

The consolidation of the bureau of markets and the bureau of crop estimates for the sake of economy and greater efficiency.

Material expansion of the studies of the cost of producing farm products.

Thoroughgoing scientific study of the whole problem of farm labor.

The making of every feasible effort to aid the farmer in obtaining necessary personal credit.

Broader studies of the methods employed and results obtained by farmers in attempts to improve their credit through united and cooperative action.

The direction, through thoroughgoing studies, of national thought toward solution of the problem of farm ownership.

Increased attention to land settlement and colonization, to the end that the buyer may have full and complete information for his guidance.

An expansion of the studies of life on the farm, to the end that the better things of life may be brought in increasing measure to the rural community, so that strong, intelligent, well seasoned families will not abandon the farming community for the city.

Proper encouragement of all feasible means to limit the hazard of agricultural production.

Expansion of the work already begun by the department in finding means for utilizing surplus and waste farm products.

A still further spread of extension work among farm women, and an acceleration of research work in home economics.

That the nitrate plant at Muscle Shoals be put in operation, to the end that this nation may escape once for all from dependence upon foreign nitrate fields.

The appropriation by congress at its next session of funds to continue the federal aid road program, to be expended under the terms of existing legislation with certain modifications, at the rate of $100,000,00 a year for a period of five years, beginning with July 1, 1921.

The appropriation of sufficient funds to permit the department to cooperate effectively with all the states prepared to work with it in preventing and controlling forest fires and other causes of forest devastation.

The reforestation of devasted lands within the national forests and the enlargement of the national forests by further land purchases and exchanges of land or timber for private lands of equal value.

A restoration of forest experiment station work to the status it had before being curtailed by reduced appropriations, and the establishment of at least one station in each of the main forest regions of the country.

Action toward developing the public resources in Alaska by lodging authority in men on the ground to act without waiting to consult distant superiors, as has already been done by the forest service in administering the national forests.

Amendments to a number of important laws administered by the department of agriculture to the end that their enforcement may be more effective.

Authorization of the secretary of agriculture to appoint a director of scientific work and a director of regulatory work, to devote their attention to development and coordination of research and regulatory activities of the various branches of the department and their coordination with similar lines of work in the various states.

Appropriations sufficient to permit of justice to the employes of the department of agriculture in the matter of salaries and equipment for work.

PROPOSED PHYLLOXERA TREATMENT

When rooted grape vines are being purchased for new plantings the question of protecting localities free of phylloxera against infestation becomes acute. The urgent desire and legitimate right on the part of the grape grower to purchase rooted vines, and the nurserymen to dispose of such stock, is opposed by the county horticultural commissioners acting in the interest of their respective counties and who are unwilling to assume the grave responsibility of possibly causing the insect to be introduced in uninfested localities. Such a condition creates an issue which must be considered from a viewpoint of self preservation and one which should appeal to the conflicting interests.

When no mutual understanding can be definitely reached the only positive means of treating rooted vines should be employed, the hot water method of phylloxera disinfection. It should be applied at the shipping point and a certificate to that effect should accompany the shipment, stating that the treatment had been carried out under the supervision of the county horticultural commissioner.

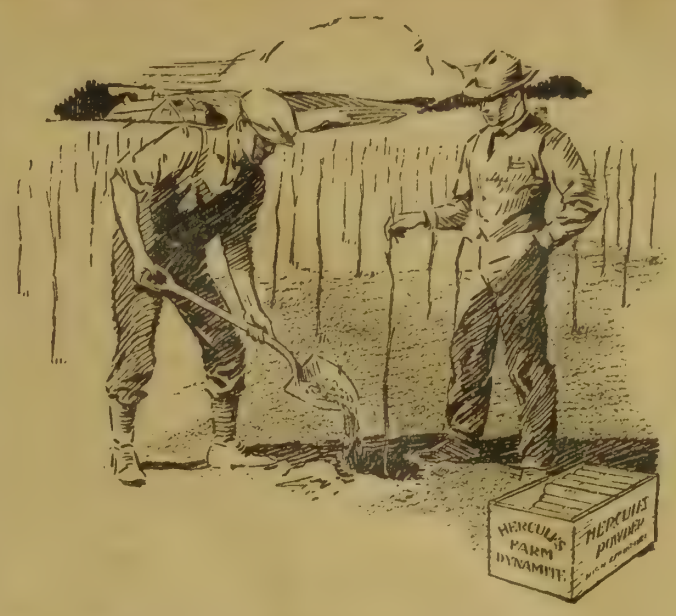
If at the point of destination the horticultural commissioner still has a reasonable doubt that the process of disinfection has been successfully done, the rooted vines then should be submitted to the treatment a second time, which should produce no injurious effects. Until a more practical measure as safe, effective and dependable as "the hot water method" is worked out, which is utterly impossible for this season, the suggestion is here offered that the contending parties come to an understanding upon the foregoing terms regarding disinfection.

The hot water method is quite simple in theory but rather complicated in practical application because of the difficulty of maintaining the temperature of the dip within certain limits. This, however, can be overcome to a certain extent by washing the bundles of rooted vines in lukewarm water prior to treating them, which has the double advantage of cleansing the roots of all adhering soil and reducing the difference of temperature of the vines compared with that of the dip.

The method consists in submerging the rooted vines in water at a temperature of not less than 125 degrees and not more than 130 degrees Fahrenheit for not less than three and not more than five minutes. Live phylloxerae and eggs are killed at 123 degrees for an exposure of three minutes. Rooted vines are not injured at 130 degrees during a submersion not to exceed five minutes.—R. L. N.

ORANGE TESTING WORK

It has been pointed out that some of the newer brix spindles put out by manufacturers are standard at 20 degrees Centigrade instead of 17.5 degrees. They are just as good as the old ones, but of course must be used with a different temperature correction table than that used for the 17.5 degree instrument, as explained in the orange testing circular issued from the office of the state department of agriculture under date of November 20.



It Makes Them Grow

YOU can't beat Hercules Farm Dynamite when it comes to blasting holes for fruit trees. The soil is broken up so fine that it's a cinch to clear out the holes and put in the trees. And say, those trees certainly show by the way they grow that they like holes blasted with

HERCULES FARM DYNAMITE

Send for "Progressive Cultivation." You need this book for it tells you all about the use of explosives on the ranch or in the orchard—how to plant trees, cultivate bearing orchards, clear land, subsoil, and do many other things with the help of Hercules Farm Dynamite.

Send in tue attached coupon *today*—and this book will be sent you free of charge.

Hercules Farm Dynamite is for sale by leading Hardware and Implement Dealers

Increasing Profits from Prune Orchards

In the prune orchard of the Blauer Ranch, Saratoga, Santa Clara County, Cal., three pounds of *Arcadian Sulphate of Ammonia* per tree increased the yields of prunes 3,780 pounds per acre. At 10½ cents per pound, this gave a profit of $396.00.

Arcadian Sulphate of Ammonia, applied about the middle of January, at the rate of from 100 to 300 pounds per acre, will invigorate the trees and increase the production and development of more fruit buds.

It will enable the tree to carry and mature more fruit. The fruit will be of larger size.

When Writing Advertisers Mention California Cultivator

Antelope Valley Growers Organize

By Ernest Braunton

CONSIDERING the sparseness of population in the district there have been few horticultural interests so united in a determination to organize as that witnessed by the writer on the part of the Antelope Valley fruit growers on the evening of December 10, at a meeting held in the school house at Little Rock, Los Angeles County.

Horticultural Inspector H. C. Pegler called the house to order, J. W. Scott acting as secretary. L. G. Haight, district manager of the California Fruit Exchange, came down from Fresno to tell of the advantages of organization, to answer questions as to methods, procedure, etc., looking to a permanent association of growers. In reply to questions Mr. Haight stated that they handled last year from 700 to 800 carloads of pears. Only one association in his district pools its fruit, the one at Atwater, where the crop is about half and half grapes and Elberta peaches. He favors pooling, however. After he had fully explained the workings of the association and answered many questions the growers in the audience grappled with the task of organization, which was accomplished in a few minutes.

Just 46, by their use of the written ballot, evidenced their desire to become members. The meeting was primarily one of pear growers but in a brief discussion it was decided to include all. Several speakers called attention to the growing acreage of apples and grapes. Inspector Pegler said Prof. F. T. Bioletti visited that section the day before, was much impressed with the outlook for grapes and would be back for three days in January to make a survey of the valley to determine the best varieties to plant. So the final vote was unanimous for the name "Antelope Valley Fruit Growers Association."

Five directors were elected, two from Little Rock and one each from Palmdale, Del Sur and Long View. The annual dues were placed at $5, the official place of business was left to the determination of the directorate who are: For Little Rock, E. E. Fugit and W. J. McAdams; for Palmdale, H. W. Menning for Long View, Norman Evans; for Del Sur, Donald Graham. These directors will meet in a few days, elect officers, perfect organization and get busy on welding all the valley growers in a cooperative movement for the marketing of crops, buying of supplies, etc.

The following morning found Vincent F. Blanchard, assistant county farm adviser, giving a demonstration of pear tree pruning in an orchard near Palmdale, and a considerable number of the participants in the previous evening's meeting were able to be present. Orchards of large trees are very few in the southern part of the valley, where nearly all the pears are grown, but the acreage is extensive and each year is still further extended, for no section of California grows better pears, and all residents are enthusiastic over present accomplishments and future outlook.

Purple Vetch in Humboldt County

By C. E. Robertson

A GOOD many years ago a practical farmer and dairyman sold his farm and dairy herd in the rich Eel River Valley, rested about two years and bought another farm on bench land near Rohnerville.

He soon missed the strong, rich productive soil of Eel River Valley and, nothing daunted, he put his hand to the plow to regain the same productive soil he had known and farmed since boyhood.

Once more the old adage that "Necessity is the mother of invention," rang true. Black purple vetch was recommended and given a trial. Three hundred pounds of very indifferent seed was obtained from Georgia and a small amount of first-class seed was secured in Oregon and put in by the two pioneers in purple vetch raising in Humboldt County, Edward G. East and John H. Meiser, both of the old county fair town of Rohnerville.

The first crop was not very good, but after that the raising of purple vetch in Humboldt, barring disease or aphis, was an assured success.

The yield for the 1920 season just closed was 150 tons, and the acreage now being planted is 2,000 acres under the auspices of the farm bureau, 200 acres under contract to a Los Angeles seed house and 200 acres seed not contracted. The farm bureau is making contracts netting the growers 14½ for the 1921 and 1922 crops, and the estimated yield of the 2,400 acres is placed at 1,100 to 1,250 tons for the 1921 crop.

At the present time the orange growers of the state are outbidding everyone for fertilizers. Reliable figures show that the citrus growers of the state spent over $512,000 for animal manures the past season, and their average expenditures for several years just past have exceeded $1,000,000 per year for all fertilizers, so it is no wonder that they are outbidding all others for the purple vetch seed to enrich their land by the nodules on the roots collecting nitrogen, and plowing under the green crop.

Not all the farmers who wanted seed to plant this fall in Humboldt County were able to secure it, but a year from now it is probable that all who want seed in this section can secure it.

Dr. Logan, our farm adviser, is simply camping on the job, gathering data about the way the present crop is being plowed and everything connected with the seeding, and after next harvest he will be in a position to give out much valuable information on growing purple vetch.

The bulk of the 2,400 acres now being seeded is being plowed by tractors and the amount of seed drilled in is being reduced from 50 to 60 pounds per acre of former seasons to an average of 40 pounds per acre this season.

The growers of purple vetch have organized and placed their dues at $1 per year, under the name of Purple Vetch Seed Growers Department of the Humboldt County Farm Bureau.

Purple vetch will be of more value right here at home to plow under and build up Humboldt farms that have been cropped with grain for so many years than all the returns our farmers will receive from the sale of seed. This idea is based on a pretty thorough trial that has been made in a quiet way of just what purple vetch would do when plowed under to enrich our worn out lands.

FUMIGATION

Fumigators will find much of interest in Bulletin 907, U. S. D. A., "Fumigation of Citrus Plants With Hydrocyanic Acid: Conditions Influencing Injury." It was written by R. S. Woglum while he was still with the department. This bulletin will be of interest to citrus growers or to anyone having to do with insect pest control through the use of hydrocyanic acid. Mr. Woglum summarizes:

It is necessary to consider the prefumigation and postfumigation environments of fumigated plants as well as that during the actual treatment.

Sunshine is the chief prefumigation factor that increases injury and this influence is greater at high temperatures than at low. Under darkness or diffused light, temperatures upward to at least 100 degrees Fahrenheit do not appear to increase injury unless the fumigation or postfumigation temperatures exceed 80 degrees Fahrenheit.

The environment after fumigation approximates in importance that during the actual treatment. Of the postfumigation factors both sunshine and temperature modify the degree of injury. Sunshine, the more important,

is most destructive to plants exposed immediately after fumigation, but affects them deleteriously at least two hours after the treatment. Temperatures of 80 degrees Fahrenheit or above injure plants more severely than lower temperatures.

The fumigation of citrus plants is most safely performed at temperatures below 80 degrees Fahrenheit.

Diffused light before, during or after fumigation exerts no more deleterious influence than darkness.

Moisture on citrus plants does not increase the degree of injury. An application of cool water to plants in hot sunshine immediately prior to fumigation appears to reduce slightly the effect of the gas.

Sudden changes of temperature over a wide range during exposure to hydrocyanic acid gas tend greatly to increase plant injury.

The optimum environment for safety to plants is diffused light or darkness at uniform temperatures below 80 degrees Fahrenheit before, during and after fumigation. The lowest temperature tried, 55 degrees Fahrenheit, was within the range of the optimum.

Fumigation at temperatures upward of 80 degrees Fahrenheit is safest under cool prefumigation and postfumigation environments. The maximum injury follows high temperatures for all three environments.

The physical and chemical conditions of the soil influence injury from fumigation. Trees in a wet soil tend to be more severely injured than healthy trees in a dry soil. However, trees in soils deficient in moisture for such protracted periods as to be severely weakened are more susceptible to injury than if grown under optimum moisture conditions. Irrigation should follow fumigation, not precede it.

The physiological condition of plants is one of the most important factors regulating fumigation damage. A condition akin to hardiness appears to be the optimum for gas resistance and is brought about by dryness of the soil, cold weather, and possibly by continued very hot dry weather which exceeds the optimum for the plant.

Sunshine fumigation can be conducted with safety by proper regulation of the dosage and length of exposure.

BOLL WEEVIL IN ARIZONA

(Continued from Page 5.)

able damage. The opinion of Dr. W. Dwight Pierce, now a consulting entomologist of Denver, Colorado, is of especial interest owing to his personal knowledge of the wild cotton and its insect enemies. The following paragraphs are extracts from his statement dated June 24, 1920:

In the opinion of the writer it is possible by proper methods to eradicate the pests of wild cotton and finally the plants themselves. It would be an expensive undertaking, however. It would probably require at least a half million dollars and a period of three or four years, perhaps longer, to bring such a project to a successful conclusion in the mountains near Tucson. For the present normal conditions should be restored and maintained with certain improvements and precautions, while principal efforts should be directed toward searching for and cleaning up infestations of cultivated cotton, both planted and volunteer. The need for the strictest measures to prevent the introduction of the wild cotton pests into California cotton growing districts is apparent.

BOLL WEEVIL SITUATION AS HANDLED BY ARIZONA AUTHORITIES

In connection with the foregoing we quote dispatch appearing in the daily press early in the present month. The dispatch is from Tucson:

"State Entomologist Don C. Mote is active here in the cleaning up of several hundred acres of Pima cotton in the Rillito section near Tucson, where native boll weevil has been found. Assistance is being given by the Pima County farm bureau, and $7,500 has been granted from emergency state funds for the employment of the necessary labor.

"The weevil is the same that has been known for possibly hundreds of years in the wild cotton that is to be found in the foothill country along the Santa Cruz Valley. It is considered of rather immaterial sort, but scientists fear that with abundant feeding upon domestic cotton plants, the weevil would become an active menace, approximating in size and vigor the weevil of the Gulf States.

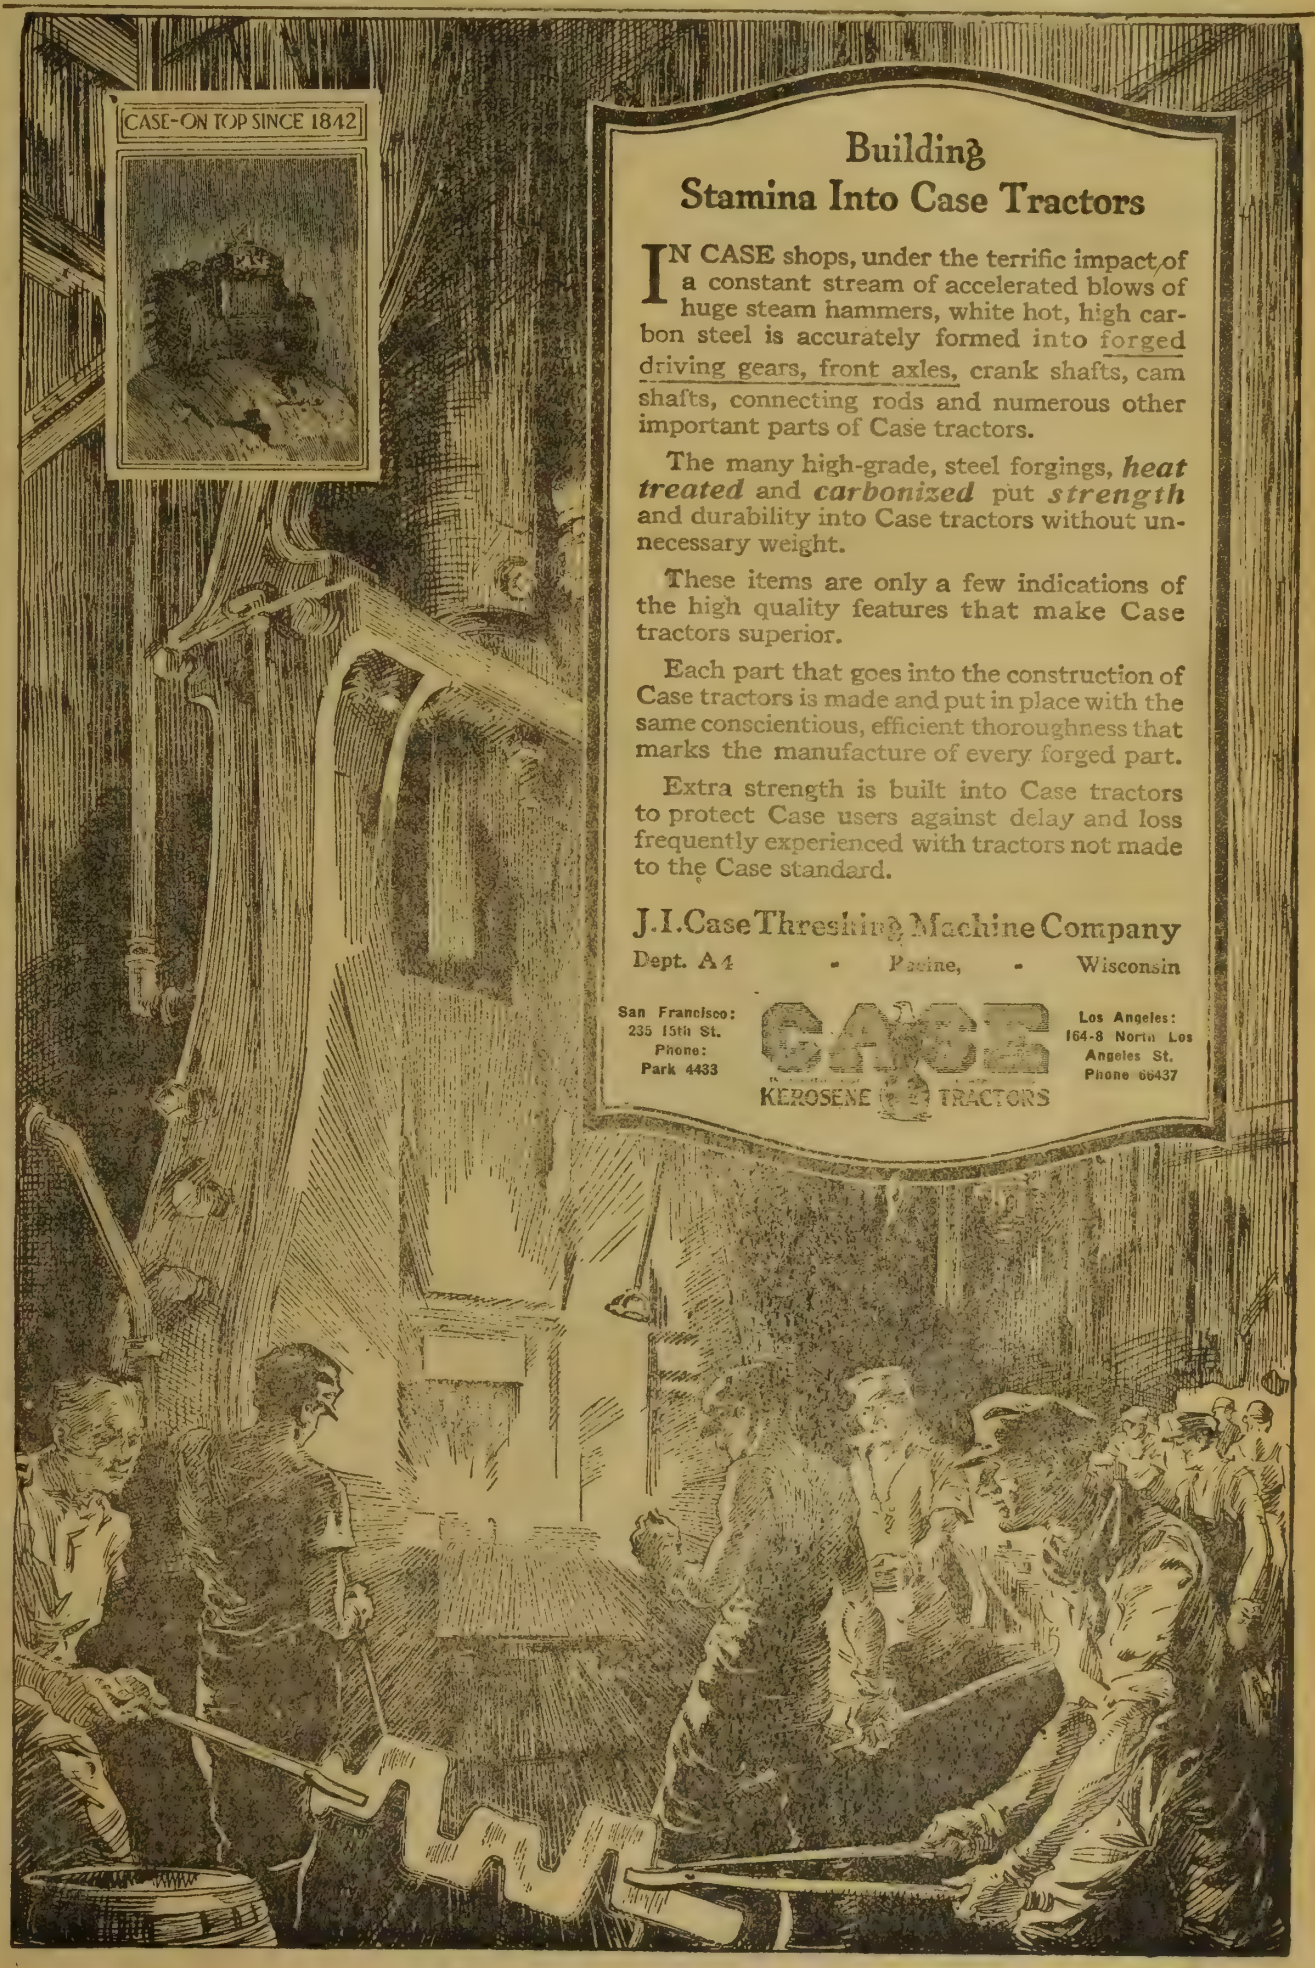
"There was full appreciation of the situation last spring when a careful hunt for wild cotton plants was started at a number of points. At that time there was belief that all the threatening plant growth had been destroyed. At only a few points, such as on the edge of the Rillito Valley, has there been any possibility of actual contact between the wild cotton and that of the lower irrigated fields. To this limited district, it is understood, the pest has been found confined, and there is belief that its further spread will be prevented by the vigorous measures set afoot.

"While further growth of cotton in this locality may be affected by the unwelcome discovery, it is believed there can hardly be spread of the trouble to other points in the Southwest, as the wild cotton is known only in this locality and to the eastward, while the main cotton fields of Arizona are to the westward, beyond arid plains, and in sections where the desert hills hardly could bear the offending plant.

"The state board of agriculture and horticulture and the planters' associations of the other cotton growing districts, such as those around Yuma, Phoenix, Mesa and Florence, are cooperating in quarantine measures that are expected to keep the embryonic pest relatively as far distant as is the weevil of Central Texas. There even is no assurance that the wild weevil would constitute a serious menace, but on that point there is to be no laxness in precautions. The transfer of seed, cotton or plants hence to other cotton growing sections of the Southwest will be put under the same limitations now known to southern cotton. Locally, there can be no doubt that the cotton industry has suffered a serious blow, whether the scientists do or do not succeed in total eradication of the much feared pest."

COURTESY

Courtesy is an obligation, an indicator, an introduction, a recommendation, a passport, an influence, an opportunity, an investment, a peacemaker and a pleasure. It is doing and saying the right thing at the right time in the right way. It makes friends, not only for yourself but for the company, shortens the day and makes the world a more pleasant one in which to live. Courtesy pays larger dividends than any other personal quality. Smile, look pleasant, be cheerful and every trouble will be lessened, every joy increased—Service Bulletin, Colonial Navigation Company.



CASE-ON TOP SINCE 1842
Building
Stamina Into Case Tractors
IN CASE shops, under the terrific impact of a constant stream of accelerated blows of huge steam hammers, white hot, high carbon steel is accurately formed into forged driving gears, front axles, crank shafts, cam shafts, connecting rods and numerous other important parts of Case tractors.
The many high-grade, steel forgings, heat treated and carbonized put strength and durability into Case tractors without unnecessary weight.
These items are only a few indications of the high quality features that make Case tractors superior.
Each part that goes into the construction of Case tractors is made and put in place with the same conscientious, efficient thoroughness that marks the manufacture of every forged part.
Extra strength is built into Case tractors to protect Case users against delay and loss frequently experienced with tractors not made to the Case standard.

Bean Truck Sprayer

An ideal outfit for the truck-gardener, small fruit grower, and general farmer. The truck attachment can be raised or lowered at will, and the wheels and nozzles can be adjusted to work in rows of any width. The attachment can be quickly and easily removed, when the rig is used for general spraying, whitewashing, disinfecting of chickens, hogs, pens, etc. Capacity of 4¾ gallons a minute at 200 lbs. pressure. 1½ H.P. Simplicity Engine (magneto ignition). Bean Porcelain-lined Cylinder, Ball Valves, Rotary Agitator, and other high grade features not found on any other low-priced sprayers. "Bean Quality" all the way through. In addition to the rig as shown above, we furnish a similar outfit mounted on a truck, as shown below, or to be mounted on your own truck or sled.

Send the Coupon

Get the new Bean Catalog which tells you all about the Bean Truck Sprayer, as well as the full line of Bean Outfits, including the Bean Super-Giant—the outfit for large orchard where the greatest capacity and very high pressure are required.

BEAN SPRAY PUMP CO.

New Black Scale Parasite Established

By H. J. Ryan, Los Angeles Horticultural Commissioner

THE history of the complete control of the cottony cushion scale, Icerya purchasi, by the use of natural enemies, and the more recent success in securing control of the mealybug, Pseudococcus spp., by beneficial insects introduced by the California state department of agriculture, makes us ready and eager to expect the ultimate control of other serious pests of citrus trees through the distribution of beneficial insects.

Horticultural officials and entomologists, in Southern California particularly, have been waiting with interest to hear the results of the liberation in selected districts of the new South African internal parasite of black scale, known as Aphycus lounsburii. Harold Compere of Alhambra has been in charge of the details of the experiment under the direction of Harry S. Smith, entomologist in charge, California state department of agriculture.

The work was carried on carefully, and recent reports of results secured on a considerable acreage of citrus under observation on the Limoneira Ranch at Santa Paula have aroused renewed interest in the possibilities of the biological method of control of insect pests.

The salient facts of the progress of the work to date were called to the attention of horticultural officials and entomologists of the southern citrus counties in company with a committee from the California Fruit Growers Exchange on December 10 at Santa Paula.

They were shown a block of 55 lemon trees which had one year previously been severely infested with black scale. The first liberation in Ventura County of the new parasite, aphycus, was made on these trees in the fall of 1919, when 1,000 of the insects from the Alhambra insectary were placed in the trees. This block has not been fumigated since, and at the time of the meet 14 months later it was almost impossible to find a live scale on the trees, though they were numerous on untreated trees.

As soon as the Limoneira Company saw the possibilities ahead, they set up cages and commenced raising aphycus by the thousands. From May to October, 1920, they liberated 72,000 aphycus on a block of 10,000 trees. These were not fumigated, though they were very dirty with black scale. The scale is now practically under control and the trees are rapidly cleaning up in appearance.

During November, 1920, over 67,000 aphycus were liberated on another block of some 2,500 trees. At the time of the meeting great numbers of parasitized scales were found in orchards in which no liberations of parasites had been made, almost half a mile east and northeast of the original block of 55 trees, showing that they are carried by the wind.

Another beneficial insect, a ladybird beetle, Rhizobius ventralis, collected in great numbers from the Rand McNally olive orchard at La Mirada, was liberated in some parts of the Limoneira Ranch and has done some remarkable work, but the chief interest is centered in the work of the aphycus, as it has been shown that this insect can be bred in great numbers under artificial conditions. S. H. Essig, who is in charge of the parasite distribution for the Limoneira Company, furnished the figures given above and made the statement that a $16,000 fumigation bill has been saved to the company through the work of beneficial insects the past year.

The question uppermost in the minds of those who know of the results obtained at Santa Paula is whether the same thing can be done over all the black scale infested citrus districts of Southern California. Assuming that under Santa Paula conditions the excellent control obtained since the first liberation of parasites can be extended and continued, we must face the fact that only in a comparatively small citrus acreage have we the uneven hatch of scale found in Ventura County. In most districts there is a fairly even, uniform hatch of black scale, preceded by a period where practically all the insects are in the adult stage and there are none which can be attacked by the aphycus. There is danger therefore, that the parasite may die out for lack of food unless there is enough uneven hatch in the vicinity to tide it over or they can be bred in great numbers in the insectaries for liberation each year.

Los Angeles County acreage is now being surveyed by the county horticultural commissioner's department in line with a plan agreed upon with Harry S. Smith several weeks ago, to locate the areas of uneven hatch, and it is expected the state will make the first introductions in these districts. in fact, such introductions have already been made in possibly favorable localities, and the state department is planning to take up the same work in other counties.

A certain delay must be expected in organizing and collecting equipment to breed and distribute the parasites over the enormous acreage of the Southland, even if these introductions are sure to be successful, and this is still a matter of experiment.

Were it only necessary to provide for stocking 1,000 acres or 10,000 acres it might be done in a short time, but this is a matter of perhaps preparing to care for some 150,000 acres. There are 60,000 acres of citrus in Los Angeles County alone, most of which requires frequent treatment for black scale.

The problem of furnishing a supply of beneficial insects sufficient to keep these millions of trees clean of black scale might be compared to the problem of organizing from the beginning and maintaining a poultry industry big enough to keep the population of Los Angeles supplied with eggs for the breakfast table.

Great numbers of beneficial insects must be provided. These will have to be bred in insectaries. A food supply of live scale must be provided for this purpose in the breeding cages. The scale live best on succulent plant growth. Potato sprouts have been found best for this. Temperature and moisture conditions must be kept just right or the potatoes will not sprout as desired and care must be taken to keep rots and burrowing larvae from attacking and destroying the tubers.

The men who have the work in hand are as expert in their line as the successful poultry rancher must be well trained in his, and the difficulties encountered in the latter calling are no more exasperating than the problems of the entomologist.

The organization of men and material cannot be built over night, but if the work continues to prove successful we are assured that organization will be pushed as fast as experimental work points the way to practical application.

BLACK SCALE CONTROL

In order to distribute the black scale parasite, Aphycus lounsburyi, so it will be most effective, the southern citrus counties are being closely studied regarding the uneven hatch of the scale. Every horticultural inspector in Los Angeles County is preparing a map of his district showing times of hatching. During the first week in January Harry S. Smith, entomologist in charge of pest control, state department of agriculture, will be in Los Angeles to canvass these maps with Horticultural Commissioner Ryan and plan a liberal distribution of aphycus at the time it will prove of greatest value.

SHIPPING POINT INSPECTION

A letter recently received by L. J Weishaar, supervising inspector of the shipping point inspection service, from a prominent member of the Eastern trade, reads as follows:

"I am mighty glad to note your progress in development of shipping point inspection, and this is filling a long felt need in the shipment and sale of California vegetables. The trade at first was rather skeptical, and so they were, you remember, when the bureau of markets first started operating This shipping point inspection service is being found by some dealers who have had their own representatives in California, an improvement

in that the reports have more detailed information and give the purchaser at this end a more thorough understanding of the character and condition of the products ordered.

"There have been some disputes at this end and some variations between the official reports at shipping point and the bureau of markets inspection here, but we are maintaining that the shipping point service is more thorough and dependable from the fact that in the majority of cases the goods are inspected before being loaded in the cars.

"We know of none at this end that do not hope for a continuance and further development of California inspection service."

DATES IN THE SAN JOAQUIN

(Continued from Page 3.)

"For 25 years he kept up interest in the dates. The success of the U. S. government plantings at Mecca and Tempe led to a conviction that the San Joaquin Valley with its immense treeless areas should be devoted in part to date production, provided hardy species could be found. Six years ago he began to put some of his ideas into practice. He bought lands and secured U. S. department of agriculture cooperation in getting seeds. He personally gathered seeds from early ripening varieties in the various corners of the San Joaquin Valley and planted 73,000 seeds, most of which germinated. His investigations led him to believe that the date palm would not only thrive in the alkali lands of the valley but that the better species would ripen a fine quality of fruit, and that other dates, those not ripening in time for the fruit pack, would make valuable feed for stock.

"Mr. Nutting has seen his work for the raisin growers bring wonderful results. He has the same faith in the possibilities of the date industry in Central California, and he backs his beliefs with action and his own money. His work in the Fresno district has attracted wide attention, an attention that may be yet more interested when the young trees add the luscious date to the valleys's already overflowing fruit basket, especially on the vast extent of alkali lands which grow dates and do not grow any other valuable crop."

BENEFICIAL SOIL ORGANISMS

By Howard C. Draper

Importance of soil organisms to agriculture is widely underestimated. Decomposition of nitrogenous organic matter may begin with either decay or putrefaction. Decay is produced by aerobic (requiring air) bacteria and occurs under favorable conditions for the bacteria. Under conditions adverse to decay putrefaction occurs, produced by anerobic (avoiding air) bacteria. The two processes may occur at the same time, one internally, the other externally.

Substances undergoing decomposition are broken down to carbon dioxide, water and ammonia. The ammonia will combine with oxygen to form water and nitrogenous compounds. In the process of decomposition two classes of substance are produced, one having been secreted by the bacteria and the other formed by the removal of certain materials from the original compounds.

A large number of bacteria carry on this process and the resulting product depends on the substance involved and the bacteria engaged. These changes involve a breaking down of more complex compounds and a formation of simpler ones. In all of the various steps different kinds of bacteria function. Each set of bacteria has its own particular field of action. It works when the substance undergoing decomposition reaches the particular stage for its optimum development. Under favorable conditions it remains inactive. The work concluded by one kind of bacteria is taken up by the next, and thus continued, step by step, until final decomposition is complete.

Details concerning the process by which this is done and the exact bacteria functioning are unnecessary. The important consideration is the circumstances under which nitrogen is made available to plants. During ammonification, which follows decay and putrefaction, ammonia is formed. Each bacteria has its maximum ability in the decomposition of certain substances.

Some plants are capable of using ammonium salts as a source of nitrogen. Other plants prefer nitrates. After ammonification nitrifaction occurs, which is the oxidation of the ammonia; that is, oxygen is added to the ammonia and the result is a nitrate.

The bacteria which form the nitrates are incapable of working in the presence of a large quantity of organic matter. Although the organic matter is decomposed, nitrates are not formed in any quantity. This serious loss may be avoided by not overapplying organic matter.

Aeration has much to do with nitrification. The bacteria acting in this capacity are aerobic, hence the more air available the greater production of nitrates. Nitrifaction will then take place most effectively within the limits of tillage.

AMERICA'S GREATEST PRODUCTION YEAR

(Continued from Cover.)

worse off than he has been in other years with short crops and high prices. One thing that would help to remedy this is some means, wherever feasible, of carrying over to periods of low production the surplus from years of high production. More attention to marketing and the development of a latent consumption demand in years of large supply will also be helpful."

SCHOOL GARDEN PRIZES

One hundred dollars in prizes has been offered by Hon. Lysander Cassidy, formerly of Phoenix, now of the farm loan bureau of Berkeley, California, to the chamber of commerce at Phoenix, to be given as a prize fund to the boys engaged in school garden work in the city of Phoenix. Professor J. D. Loper, superintendent of the city schools, in acknowledging the gift says: "At the present time we have ten classes in gardening and we will divide this up into ten parts, and each part into at least three or possibly four prizes for the best kept garden."

For bigger crops, break up the Soil crust with a Planet Jr.

A baked and crusted soil does as much damage to your crops as cold or dry weather. Cultivate with a Planet Jr. to break up the soil and keep it from baking, to give the roots air and warmth, to form the dust mulch that holds in moisture and soaks up the rain.

Not only does the Planet Jr. work thoroughly, but because of its scientific construction, strength and lightness, saves time and labor as well, doing the same operation better than any other implement.

No. 72 Planet Jr. Two Row Pivot Wheel Riding Cultivator works two rows at once, saving time and labor. In corn, potatoes, and other large crops, it is the most efficient of all cultivators.

January in the Vegetable Garden

Southern California

By D. F. Reichard

IT IS getting to that time of the year when we should be thinking of putting our land in shape for spring planting. You say we haven't had enough rain to put the ground in working condition. That is one thing we must look out for in Southern California. Many of our market gardeners would rather not have rains so that they can apply water as it is needed and in such quantities as they want it. Lacking in rain we would suggest that you turn on the water. You seldom use your minimum of water during the winter months, why not put it into your ground? If you are connected with a city water system it will no doubt be convenient to run a sprinkler, in which case let it run two or three hours at a time at each setting. If you have ditch or flume water, check off your plot intended for garden in convenient sizes and flood the ground about six inches deep. Either of these methods will wet the land enough to permit good deep plowing or spading.

If rains are not sufficient by planting time, furrow out and irrigate. As soon as the ground can be worked without sticking to your tools work it up, pulverizing thoroughly and sow the seed while the soil is still in good damp condition.

What are you going to plant this coming season? Where is the garden to be located and how large will it be? All these questions and many more come up when one begins thinking about gardening. Therefore, it is really necessary to sit down with the family and plan out the garden to be. Yes, get the whole family interested in the garden. Grow something of interest to each of them or get them interested enough so that they will want to care for their favorite item.

Select a piece of ground for the garden that is naturally rich, well watered, of a nature that drains nicely and with a southern exposure if possible. There should be a slight slope to the land so as to irrigate easily. The size will be controlled by the space available and the amount of work one wishes to apply. In cities the garden is usually confined to the back yard, where a space 50 by 75 feet would be a good sized vegetable garden, and one will be surprised how much stuff can be grown on so small a space. On a ranch the garden should comprise a much larger space, as most of the heavy work can be done with a horse and implements, a plow a harrow and cultivator. If the plot selected is to be the permanent location of the garden it is advisable to first consider the perennial plants that will be wanted and arrange for them in such positions that they will not have to be moved. In this list will be dewberries, blackberries, Himalaya, Mammoth and Thornless blackberries, Phenomenal and Loganberries, red, black and yellow raspberries, strawberries, grapes, currants, gooseberries, artichokes, asparagus and rhubarb. These should be arranged according to their habit of growth, the heavier growers or vines being planted at the outer edges. Allow six to eight feet between the rows of larger berries and grapes, four to five feet for the raspberries, four feet for the rhubarb, artichokes and asparagus, and two to three feet for the strawberries. All of these should be set out as soon as possible so as to get their root systems established before the growing season begins.

Next, allow space for the plants of tomatoes, peppers and egg plant. Although these will not be planted for some time, the space should be arranged. It may be used for a quick maturing crop like lettuce, spinach or radishes, or as a seedbed for cabbage, etc., before the plants are set. March is plenty early for setting out these plants.

If your garden has to be a small one, it is not advisable to plant potatoes, because they require considerable space to produce enough to make them worth while, but most of us like potatoes and feel we should put in some anyway. In favorable situations potatoes may be planted most any time after the middle of January. An average yield amounts to about 12 times the weight of the seed planted. Plant potatoes, dropping one good piece every foot in rows about two feet apart, covering the seed three to four inches. In order of their earliness plant Bliss Triumph, Red Rose, White Rose, American Wonder, British Queen.

Plant a row or two of peas; Senators or Stratagem are the best, sowing at the rate of a pound to 150 feet, giving each row about two feet and covering the seed two or three inches according to the nature of the ground. Sow deeper in the lighter soils.

Plant carrots and parsnips. Be sure to have your ground deeply worked and pulverized so that their roots can properly develop. With these in the same drill may be strewn a few radish seeds. These will come up quickly and break the surface for the more delicate carrot and parsnip plants. The radishts will be ready to use by the time the others are to be thinned out. Also plant turnips and beets. These will come up readily. An ounce of each of these will sow a row 100 to 150 feet long.

Put in some onion seed for dry onions, using Australian Brown for storing for next winter, White Globe for fall use and Crystal Wax or White Queen for early summer use and for pickling. An ounce of any one of these will plant a row 125 feet long and should produce about 75 pounds of ripe onions.

Set out plants of cabbage 15 to 20 inches apart in rows of two to three feet apart. Cauliflower plants should be set about two feet apart in rows at least three feet apart and tall kale the same. Plants all of these in the bottom of a furrow at least six inches deep and gradually work the dirt in around them as they grow.

In the frostless spots Canadian Wonder and Ventura Wonder Wax beans may be planted, but for the most of us it is advisable to wait until next month to plant beans. The same may be said of sweet corn, melons and cucumbers. So, in planning the garden it is well to reserve some space for the appetizing crops that cannot be planted for a month or two.

For those with trees and bush berries already established, this is the ideal month to prune and spray, giving them all a thorough cleaning, cultivating among any growing crops and thoroughly work up all idle ground so that it will be in good condition when it is time to plant.

To get the best results from the vegetable garden it is absolutely necessary to keep the plants in a continuous, healthy growth. To do this we very often have to supplement our rainfall with spring irrigation. This may be accomplished by sprinkling if the plot is practically level and you allow the sprinkler to run long enough at each setting. One big drawback with thorough sprinkling—anything less is not to be considered—is that the whole surface is wet so that weeds sprout and crusts are formed where one cannot conveniently get with the cultivator. The ideal way of irrigating is to make broad furrows between the rows of plants and allow the water to run slowly down the furrows. This keeps the water under control and away from the stem of the plant, so that there is no choking of the plant from having the surface soil packed and baked around the plant. The moistened ground is where it can be conveniently cultivated and mulched, leaving it in perfect condition to promote plant growth.

Bartlett Pear on Japan Roots

We still have some fine Bartlett as well as Bosc, Anjou, Comice, Flemish Beauty, Winter Nellis and other leading varieties of pears on Japan Pear roots.

These trees are grown on new soil never before in nursery stock, are well rooted, clean, healthy and hardy.

Hundreds of thousands of our trees in all parts of the West are now bearing profitable crops for their discerning owners.

We also carry a complete line of general nursery stock, all of which is guaranteed to please you.

Remember our prices cover freight and packing charges.

DON'T NEGLECT TREE WOUNDS

Neglected tree wounds lead to wood-rot or wood decay which is responsible for an appalling loss of valuable producing trees. Protect pruning cuts or other wounds on your trees with **Pabco Pruning Paste.** Ask your dealer. Manufactured by the Paraffine Companies, Inc., San Francisco, Calif —Adv.

Northern California

By A. R. Gould

TOWARD the latter end of the month a sowing may be made of both turnips and kohlrabi. For tender turnips sow Early Snowball and White Egg. Early white kohlrabi is the best. Sow very thinly in rows 12 to 18 inches apart. Both these crops require a fairly rich soil. If a sowing was made last month as advised these should be ready to thin out to six inches or more apart. Irrigate frequently.

Peas

Keep up a successional supply of peas by sowing early and main crop varieties. Sow Blue Bantam and Laxtonian, both dwarf. For main crop sow Stratagem, Alderman and Yorkshire Hero. Sow in rows two feet apart. They require much water and cultivation.

Lettuce

Sow on well prepared soil Los Angeles and Cream Butter, two fine heading varieties. Sow very thinly in rows and thin out the seedlings later.

Onions

If the main crop varieties are not already sown they should be attended to without delay. Sow Australian Brown, Ailsa Craig, Prizetaker and Southport White Globe, all fine keeping varieties. Sow in rows two feet apart and cultivate frequently after the seedlings are well through the soil. The earlier sown varieties need thinning to four inches apart.

Asparagus and Rhubarb

Both of these are very profitable crops and should certainly be more generally grown. They need quite a little manure and the beds should be dressed annually. Once established with standard varieties and well watered during the growing season these crops need little more attention for the season. Strong "crowns" or roots may be purchased from advertisers in the Cultivator and planted in rows well prepared with manure, about three or four feet apart. Selected roots of Asparagus Colossal and Palmetto should be secured and planted at once and Myatt's Victoria and Crimson Winter Rhubarb.

Carrots

Sow the early French Forcing variety in rows 16 inches apart in well prepared soil. They thrive best in a fairly sandy soil. Seed should be sown thinly, and if a frame is available a hot bed of manure may be made up and several inches of soil placed on the surface in which very early carrots may be raised. Window sash may be used for covering but this should be ventilated throughout the day.

Berries

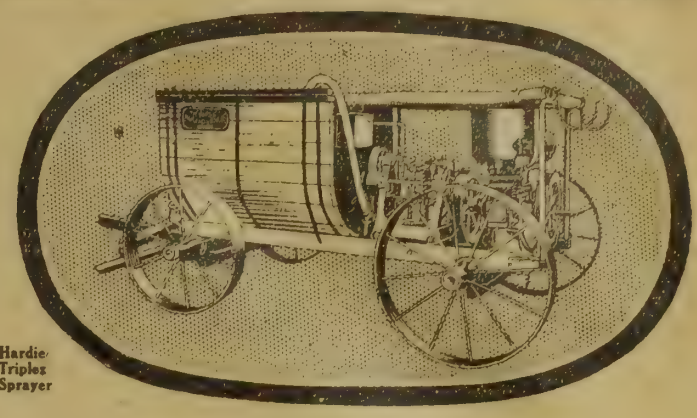
There are quite a number of berry fruits and all may be grown in and around the vegetable garden. Blackberries and loganberries may be grown around the garden fence. Of the thornless varieties of blackberry we have seen little fruit, they appear to be thornless and fruitless. The Himalayan Giant and Mammoth are two good blackberries, and the Houghton gooseberry is usually free from mildew attack. For the best raspberries plant Cuthbert, Superlative and St. Regis, two to three feet apart in rows five feet apart in well manured soil. Strawberries, Banner, Marshall and Magoon should be planted now in rows two feet apart.

Southern Arizona

By M. E. Bemis

JANUARY reminds us of the coming of spring. While there is much cold weather and heavy frosts and usually more heavy rains than in any other of the winter months, the lengthening days toward the latter part of the month are comparable to the later spring months in the Northern and Eastern states. January

High Pressure Economical Operation Big Capacity



Hardie Triplex Sprayer

Should Your Sprayer Have Gear, Belt or Chain Drive?

Here's an argument that experience will answer. The gear drive is not sufficiently flexible to be safe. The belt eats up tremendous power through slippage. The Hardie type of chain drive is as positive as gears, as flexible as a belt, yet without the faults of either. It transmits all the engine power and never gives a minute's trouble.

And the drive chains of Hardie power sprayers have less work to do because the Hardie Triplex pump is the easiest running pump known. It carries 300 pounds pressure discharging 10 gallons per minute with less horse power than any other sprayer.

The engine itself is a high duty power plant built especially for sprayer use and of the highest quality.

We guarantee lowest upkeep cost. See the Hardie dealer nearest you or write us direct. Hardie sprayers are sold wherever good fruit is grown.

HARDIE MANUFACTURING COMPANY
For 20 years the foremost, exclusive manufacturers of hand and power sprayers, including the FAMOUS HARDIE ORCHARD GUN

should be the month for preparation.

The list of plantable things is greater than for December and approaches in variety the list of things that are planted in February.

Among other things that are worthy of consideration, asparagus of the Palmetto variety seems to be better adapted to southern Arizona than any other. Asparagus as a crop requires a good deal of care and does not bring immediate return as a commercial crop, but when producing returns as much to the acre, if not more, than any other garden crop grown. For the family garden it is a vegetable which is easily grown and should have consideration. It is one of the first of the spring vegetables to mature. Asparagus plants may be put out in January. The seed should not be planted until February or March. Asparagus does well in rich, loamy soil and is quite alkali resisting. Like many other plants, it seems to be highly adaptable to Southwest inrrigated land conditions, so much so that when once established it grows wild without attention. For garden crop, however, it requires constant cultivation, irrigation, etc. The land before planting asparagus should be made rich and plowed deep. Furrows should be dug 12 to 14 inches deep and about one foot in width. For field culture it should be sown four and one-half feet from center to center. Rotted manure should be put in the bottom of the furrows three or four inches deep and then covered by rich soil. The plants are then set in these rows and this gives opportunity for irrigation until the plants are well established. The soil should be gradually drawn in from both sides as the plants grow until the crowns of the plants as first set are covered to a depth of seven to eight inches. This will of course leave a ridge and the irrigation water should flow in furrows between the rows. Cuttings may begin the second year and will usually in this section furnish regular cuttings for a period of about three months. Irrigation should be frequent during the cutting season.

Beets, carrots, kale, lettuce, mustard, onion sets and seeds, parsley, snips, radishes, spinach, Swiss ard, turnips, cabbage and cauliflower are also in order for January. Peas may also be planted. While it is advisable to plant the slow maturing varieties of peas early in the fall, they may be planted in January with fair prospects of making a crop. Usually the later plantings, that is, the midwinter, should be of the early maturing varieties. Strawberry plants may also be set in January, and should do well if set any time during the month.

The importance of thorough preparation for the garden crops cannot be emphasized too much. A good coating of rotted manure is highly essential, although most of the soil is fertile and will do fairly well, but the extra cost of enriching the soil will make the crop better both in quantity and quality. The heavy soils require this for livening up and introducing humus. The lighter soils need the added fertility as well as the humus. A Bermuda grass sod turned under in this season of the year and allowed to decay keeps the heavier soils in friable condition and helps to insure a good garden crop. This is a good season of the year to saturate the soil with water, and irrigation is almost always necessary. Most successful farmers, and especially on the heavier soils, find it advisable to irrigate for a considerable period, several hours, or sometimes half a day, with a small stream of water which flows so slowly as to percolate deep into the soil. Irrigation in itself is not sufficient, but where the crop is already growing the irrigation should be followed, as soon as conditions will permit, with cultivation which keeps the top surface in a light loose condition and where the irrigation is being followed by planting the soil should be harrowed to prevent the soil from baking by forming a light dust mulch.

The crop year of 1920 just closed in quantity production far exceeded that of 1919. Owing, however, to the slump in prices of all farm products and livestock the total values are likely to show a decline over those of 1919. In general the crops on all projects were excellent, the season having been a favorable one.

TEAGUE TREES

Are the product of Thirty Years' experience in growing Quality Nursery stock.

CITRUS TREES

Grown from Selected Buds. We are now booking orders for 1921 delivery. Place your order early and be sure of getting the best.

AVOCADOS

We handle all of the recommended varieties budded on hardy Mexican seedlings.

FEIJOAS

Excellent for jellies and preserves. Perfectly hardy and quite prolific. We can supply grafted plants from the large fruiting varieties.

January in the Ornamental Garden

Northern California

By A. R. Gould

TO ALL my readers a prosperous New Year full of sunshine and flowers. The garden lover finds every year a busy year, and usually health and contentment. Success comes with practice and experience. There are many who think luck is responsible, but careful planning, soil preparation, sowing seeds at the right time and of the best quality, frequent cultivation and irrigation, all these are contributing factors, and we would urge all to be thorough in watering or irrigating. Plants need moisture and especially during the season of transplanting. Many good specimens are lost by careless watering and lawns turn brown by insufficient sprinkling. Keep the sprinkler in one place for 20 minutes or more. The rains in our northern section have been more than generous, but we still hope for more. There is still some cleaning up to do in the garden, dead wood to cut out from the rose bushes, etc. New lawns may be sown towards the latter end of the month. Careful preparation will be necessary, and it is usually better to allow the weeds to come up before sowing the seed. It will save much weeding as there is always plenty of weed seed in the manure applied to the soil during preparation. There are several good lawn mixtures carried by your seedsmen, some having the more hardy grasses. Kentucky Blue makes a fine turf if a straight grass is required, or white clover may be added. For shady places a special lawn mixture must be sown.

Some Choice Blue Subjects

There are many useful flowers which will beautify any blue scheme, and among the best we would mention the following, which may be planted now: Salvia uliginosa from Brazil, a tall pale blue; salvia farinacea two to three feet, S. pratensis, violet blue and S. virgata nemorosa, bright purple. Delphiniums, King of Delphiniums, D. Hugo Portman and Belladonna hybrids and Amos Perry. Asters or Michaelmas Daisy: T. S. Ware, Peggy Ballard, Ericoides Ringdove and A. amethysterus. Aquilegia glandulosa, Scabiosa caucasica, Agathea coelestis, Stokesia cyanea are perennials that should be in the border which must be well prepared with manure. Plant the clumps two to three feet apart. Some charming flowers in blue grown as annuals are nemophila or baby blue eyes, a native wild flower, nemesia blue gem, lobelia and violas all make fine border plants. The nemophila should be sown directly in the flower border where it is to flower. Iris may be planted in groups such as the flag iris or German, Spanish and Dutch, and these should be planted without delay.

Sweet Scented Flowers

Mignonette, best varieties: Giant Flowered Mechet and Allen's Defiance; Mathiola; evening scented stock and Nice stocks. Sow the first two broadcast and thin out where they are to flower.

Cinerarias and Mimulus

These are both good subjects for shady places and of the former there are the dwarf or grandiflora types and stellata in various shades of blue, violet, rose, pink and white. Mimulus tigrinus, "Queen's Prize," is well worth growing, having wonderful markings. Plant these two to three feet apart in rich soil.

Roses

Now is the time to plant nice young stock of the following: Ed. Herriot, Hadley, Los Angeles, Sunburst, Rayon d'or, Lady Hillingdon, Radiance, Gen. McArthur, Frau Karl Druschi, Ophelia, Joseph Hill and Cecile Bruner, all good roses. Some satisfactory climbers are La Marque, Bridesmaid, Ramona, Beauty of Glazenwood, Silver Moon, Excelsa and Tausendschoen. Have the beds deeply dug and manured.

Trees for the Avenue

Double flowering cherry, hawthorn or crataegus, beech, catalpa speciosa, poplar carolina, purple leaved plum, maple, birch, acacias and magnolia. These should be planted 25 to 30 feet apart to allow for proper development.

Southern California

By Ernest Braunton

LET us resolve, if space will permit, to start the New Year with more dual purpose plants, those of utility aside from their beauty. Some one has dubbed them "beautility" plants. We may perhaps cut out some shabby or useless garden inmates to make room for ornamentals of economic value.

The Paraguay guava or feijoa is hardy throughout California and Oregon, is an evergreen of attractive foliage and beautiful flower of brilliant coloring. The loquat will thrive in the same range of territory and the sapote is nearly as hardy. The Satsuma or Unshiu orange is unharmed by very heavy frosts and bears excellent fruits. The strawberry guava thrives in California generally, bears polished foliage and makes a good unarmed hedge plant. The avocado and cherimoya, or custard apple, are more tender, but the Northrup avocado is uninjured by frosts where the thermometer has registered 20 degrees, the instrument hanging on a tree ten years old. The Puebla and Fuerte are next in frost resistance and the latter is the best "cropper" of all. Other varieties need warmer localities and the mango illy brooks even a light frost. But some of this list should find a place in your home grounds.

Up to present writing this season is far behind that of a year ago, both in heat units and rainfall, and therefore we still may plant all manner of bulbs, Holland and others. Native flower seeds should also be sown, for in their native haunts few plants have started growth, either in annuals or perennials. Because of belated rains and soil warmth, one need not speed up the planting of tender plants or bulbs, or seeds more apt to rot than germinate. Better bide a wee until the natural genial glow encourages growth of all kinds.

One may profitably employ time and energy in soil stirring, incorporating animal manures. But even in this be cautious. If much rain comes and your soil is light, the nitrogen may leach to levels below the root zone, and it never returns. Or your soil may have a hardpan or impervious subsoil, so that excess of water will carry plant food away by flooding. For reasons indicated do not fertilize lawns until later in the season. If soil is close and sticky much good will come through a purification by turning it up deeply and allowing rain to beat the clods to pieces, thus completely aerating it. Allow it to so lie until needed; little oxidation or burning of humus material occurs in cool or cloudy weather. Dead weeds and organic rubbish of all sorts should be turned under in this aerating process, for if allowed to lie on the surface a harbor is provided for insect pests and fungous diseases.

Visit or write some reliable seedsman or look at the planting calendar in his catalog for the best seeds to plant at this time. Such lists are long and vary with climatic conditions, so that personal research is of more value than general advisory lists in our calendar of monthly operations. Nature helps those best who help themselves most. But seeds may now be sown of all plants common to gar-

dens of Eastern states, so that newcomers may observe such lists for guidance. Annual chrysanthemums and pinks, calliopsis, or coreopsis, cockscombs, centaureas, phlox, stocks, pansies and salvias may be sown in seeds or plants set out now. Do not forget sweet peas for spring flowers; they are far more promising now than later plantings, for sweet peas thrive best while both soil and air are cool.

Old clumps of chrysanthemums may now be torn asunder and planted for permanent effect or for the taking of cuttings for propagation in sand. Or both results may come from present division. There are also many hardy perennial rooted plants like golden glow, phlox, Shasta daisy, etc., that may now be divided and replanted, but do not replant canna, elephants ear, cyperus, papyrus, dahlia or any half hardy roots. These may, however, be taken up now and stored away for March or April planting. Aside from Dutch bulbs, gladioli do best from January planting, and so do Easter lilies. Dormant, bare root roses, all deciduous trees and shrubs of hardy nature may safely be set out, also all conifers, but citrus trees, subtropical fruits, etc., should be left for 60 days, at least. Let the dealer risk loss by frosts rather than yourself, but provide a future site for them and get your order in early, for future delivery. There is plenty of work for the home gardener in January, but do not be feverish for planting.

Southern Arizona

By M. E. Bemis

JANUARY is the month for putting out bulbs. The variety of flowers which may be grown from bulbs is much larger than most people are aware of. Those which may be put out this month are anemone, amaryllis, canna, calla lily, gladiolus, Spanish iris, lily of the valley, tuberose, hyacinth, tulip, daffodil, jonquil, crocus, oxalis, Chinese lily, freesia and ranunculus.

The canna is becoming more and more popular in Arizona and New Mexico, although not grown nearly to the extent it should be. These make one of the very finest bedding plants known to this section. Some of the superior varieties that do well here are the Louisiana, Parthenope, David Harum, Austria, West Grove and Italia.

The tuberoses are natives of Mexico. They withstand the hot summer and begin blooming in May and continue until frost. These are splendid for garden flowers in the spring or for cut flowers. No flower garden should be considered complete without them. Hyacinths, like the narcissus, daffodil, jonquil, crocus and iris, should be planted rather deep in rich soil. While the cost of the bulbs is considerable, a few add so much to the attractiveness of the home garden that they should be considered indispensable.

The list of flower seeds to plant for January is not a very extensive list. Cosmos, larkspur, petunia and sweet alyssum may be planted safely. But for better results it is advisable to wait until February or March.

January is the month for the planting of rose bushes. A large variety of roses do well in Arizona. The American Beauty is said to be at its best in this climate. Of the climbing roses there is a considerable variety, including the climbing American Beauty, Marechal Niel and Sunburst. Of the general collections of roses the American Beauty is the best, but there is a sufficient variety of others that do well here so that one may have continuous blossoms of almost all kinds throughout the entire year.

Roses should be set in well prepared soil and irrigation and cultivation should be extremely thorough and deep. Cultivation is one of the secrets of success in the growing of roses.

ANNUAL FIG INSTITUTE

The annual fig institute, under direction of the California Peach and Fig Growers, will be held at Fresno the first part of January. Tentative dotes are January 7 and 8.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Thumps

I have some young hogs about five or six months old. Some are affected with thumps and some have died. They are running on acorns, alfalfa and native grass, do a good deal of rooting under trees. Can you give cause and remedy?—Subscriber, Santa Ana.

This looks as if it might be a serious affection, though thumps in little nursing pigs is not so serious or at least may be easily prevented by exercise. On this point Dietrich's "Swine" says: "Thumps is a very common ailment among pigs under certain conditions. It occurs most frequently in young pigs that do not have enough exercise. The symptoms are labored, jerky breathing, similar to heaves in a horse. The most practical cure is removal of the cause, but this is insignificant in value as compared with prevention. To prevent this trouble pigs should have an abundance of exercise, but if this cannot be supplied the ration should be materially reduced."

Lovejoy's "Forty Years Experience" also touches thumps in very young pigs and insists on proper exercise and reducing the flow of milk from the mother by smaller quantity of bulkier feed. Then it speaks of another kind of thumps or pleura-pneumonia. Of this he says: "There is another trouble one often runs up against when he walks out among his pigs in the fall, or in fact at almost any time. He finds a half grown animal, or even a mature one, breathing short and fast with a perceptible jerk in the flank and back of the heart along the shoulders. This is a pretty sure symptom of serious trouble and is generally an unfailing sign of what is known as swine plague, or what would be called, in the human race, pneumonia. This is a dangerous disease and is one of the so-called varieties of hog cholera and is really more dangerous. There is little that can be done with hogs in this condition. They should be given a warm, dry place to sleep, thoroughly rubbed with some strong liniment, that is, penetrating, all along the sides; back of the elbow; between the forelegs; all about the vital organs; then, if in a shivering condition, cover them with blankets or something to keep them warm, and keep them where no draft or cold air can strike them. It would be well, in a severe case, to consult the family physician or a good veterinarian with a view of giving them some internal treatment. The animals will appear very gaunt and probably refuse to eat. If this is the case there is not much hope. Exercise in this case is always fatal."

Banks and Banks

Can you tell me which banks are the safer to deposit one's money in, a national bank or a savings bank, and if the two banks are affiliated and one fails, are both banks held responsible for the loss? What is the meaning of "First National Bank"? Also, the meaning of "Security Savings Bank"? Is a "First National Bank" any different from any national bank and is "Security" Savings Bank any more safe than any savings bank? When banks close their doors for want of funds, as they are now doing in many places, do the depositors lose their deposits?—Subscriber, Calipatria.

The safest bank is a matter of personality of the president and officers rather than of name or of the fact that it is a national or a savings bank, or a bank organized under state laws. National banks are under supervision of federal officials; savings banks and other banks organized under state laws have their books audited and their affairs under direction of state bank examiners. A lapse on the part of any of these officials or lack of vigor in watching the interests of the people might give dishonest or inefficient officials opportunity to impair the funds on deposit and the reserves of the bank. "First National Bank" often indicates that it is the first bank organized under the federal act in any particular city and has chosen for its name the word "First." The next bank organized under the same law may choose "Second" national bank or any other name which it sees fit. A "Security" savings bank is merely the name of that savings bank and means no more than would the name of the town in which the bank is located, or "Guarantee," or any other term which may be applied to the institution. The closing of a bank's doors does not necessarily mean that depositors will lose a penny. Of course, during the closing of the doors they may not withdraw any funds, but once a receiver or, sometimes, a state bank examiner has had opportunity to get the affairs of the bank so that its "liquid assets" are available or, rather, its notes and other assets are made available in the form of cash, then the depositors may have their money and the bank may again transact business. However, if the bank has been unwise and granted loans where the cash may not be secured and the funds are entirely exhausted, then the depositor may not receive the money which he deposited. National and savings banks under the law are maintained as separate corporations; each institution stands alone and is responsible for its own acts only.

Protectors from Frost

Can you direct me to a party who sells paper boxes with glass covers for early planting?—Subscriber, Texas.

We know of no covers having glass top. There is, however, a heavy waxed paper protector used in the cantaloupe fields of Imperial Valley and other sections of the state. These come in sizes from 12 by 12 to 24 by 36, the small size selling at $4.25 per thousand f. o. b. Los Angeles, the 14 by 15 size at $6, the 18 by 24 size at $12.50, and the 24 by 36 at $25.

Fumigating Beans for Weevil

How can I treat beans to keep from weevil infestation? Would it be all right to put in sulphur house and treat the same as for apricots for drying? This would not be so dangerous as the use of carbon bisulphide.—Subscriber, Madera.

We believe the sulphuring would destroy the germ so that the beans would be of no value for seed. Both carbon bisulphide and hydrocyanic acid gas have been used successfully. The use of carbon bisulphide is the simplest and there is no danger if fire is kept entirely away at time of fumigation. A word of warning in the matter of fumigation with carbon bisulphide may be in order. First, the temperature should not be below 60 degrees. When it becomes colder than that the gas is formed so slowly that its work is ineffective. Another warning is as to using too great amount of carbon, as it has been shown that where more than eight or ten pounds per thousand cubic feet is used there is danger of destroying seed germs. However, as eight or ten pounds per thousand cubic feet is sufficient to destroy the weevil, there is no necessity whatever for using the greater quantity.

Grape Syrup

Inquiry recently came as to the best grape for making grape syrup. The question was referred to Prof. Cruess who writes:

"Of the common wine grapes suitable for grape syrup making I think the Zinfandel will on the average contain as much sugar as any of the other common varieties. It is much superior to the Burger in this respect. It is not unusual for Zinfandels of the Lodi district to reach 25 per cent to 27 per cent sugar. The Alicante Bouschet and Petite Sirah both reach high sugar content. Of the white wine grape varieties the Palomino, Semillon and Sauvignonvert give juices of high sugar content. The Tokay, Cornichon and Emperor, among the table grapes, are very low in sugar content. The Muscat, Malaga and Sultanina (Thompson Seedless) reach a high sugar content and would be suitable for syrup making especially when blended with red wine grape varieties."

Citron for Dairy Cows

What is the food value in citron compared with beet pulp, silage and pumpkin for dairy cows? Would citron take the place of beet pulp or silage?—Subscriber, Newhall.

Citrons, pumpkins, beets and other root crops all have about the same value and none of them are of value in balancing with dried pulp or silage. That is, all of these feeds are short in protein — essential feed for dairy cows. If one is feeding freely of alfalfa or bran or other protein containers then any one of these feeds mentioned are of value as an appetizer and conditioner. The dried beet pulp, however, is the best for it is rated only about 10 per cent lower than corn or barley. If the dried pulp is moistened a few hours before feeding time it affords an excellent substitute for corn silage but ordinarily the corn silage is much more economical.

Picking Winter Nelis

A pear grower recently made inquiry as to determining time for picking Winter Nelis pears. The question was referred to Fred G. Stokes, horticultural commissioner of Lake County, the great pear growing section, and he answers:

"We pick our Winter Nelis after the Bartletts, mostly about two weeks after all Bartletts are picked. One can use his judgment by noting if the pears fall and whether they part easily from the first joint. As to keeping them from decaying, of course they must be free from worms, etc., or will soon rot. Our Winter Nelis are wrapped in proper paper and shipped to San Francisco. If wishing to keep an extra long time it would be well to put them in the ice house or keep in a cool place. If picked carefully and not bruised they will keep in the open lugs."

WE HAVE just issued an interesting booklet on growing potatoes which we will send free to any address on application. The booklet deals in an authoritative way with the whole subject of potato culture from planting to digging. No potato grower can afford to be without a copy—yours is waiting for you.

TODAY

Today, whatever may annoy,
The word for me is Joy, just simple Joy:
The joy of life;
The joy of children and of wife;
The joy of bright blue skies;
The joy of rain; the glad surprise
Of twinkling stars that shine at night;
The joy of winged things upon their flight;
The joy of noonday, and the tried,
True joyousness of eventide;
The joy of labor, and of mirth;
The joy of air and sea and earth—
The countless joys that ever flow from Him
Whose vast beneficence doth dim
The lustrous light of day
And lavish gifts divine upon our way.
Whate'er there be of sorrow
I'll put off till tomorrow,
And when tomorrow comes, why then
'Twill be today and Joy again!
—John Kendrick Bangs.

A PARADE AND A COOKY

By Clara Peterson

NOW children, don't think that this is only a story, for it really happened.

Once upon a time, not very long ago, there was a boy just eight years old, and he had to work very hard. He was quite thin and pale, but his eyes were brown and laughing and he was tall and straight. Even in his oilcloth baking apron—but there, I wasn't going to tell that yet.

His name was Silvester and he lived with his father's uncle-in-law, in a small bakery just around the corner. Uncle Jeremy was the only relation Silvester had, and he wasn't a very near one, was he?

The bakery looked quite high from the road. There were two wide, dusty windows, and the front of the building went up into a sharp peak, but there was nothing at all behind the peak, for the shop didn't have an upstairs—just the front room where Jeremy spread out rolls and cakes and pies on long, paper covered tables, and the middle room where the big stove stood, and the back room where there were two hard beds and a chest of drawers, and nothing else.

Silvester couldn't remember when he had had a really good time. It seemed to him that he had never done anything but sift flour and wash currants and cut fat cookies to lay in the tins. Of course, he had a great many broken cookies to eat, but his uncle couldn't afford, or so he said, to buy milk and eggs and fruit; no wonder Silvester was pale.

However, he was often happy when Jeremy wasn't too cross. He would stand at the long mixing bench and sift and roll and cut, or he would bend down to the hot oven and carefully lift out the gingerbread ladies and the raisiny buns.

One day, however, Silvester wasn't even as happy as usual. It was autumn and the leaves on the tree in the little sandy front yard were turning to red and yellow banners. Silvester did not like to look at them, for when the leaves blew back and forth he thought of the crimson blankets on trotting ponies and the gold of ladies' gowns.

You see, a circus had come to town and Silvester wasn't even to see the parade which always went up and down Main Street three blocks away. Uncle Jeremy had gone into the country for a load of flour and there was no one else to mind the shop.

Silvester might not have cared so much, but two years before he had seen the very last end of another circus parade and he knew just how wonderful it was—there had been two princesses on two humpy camels, and a steam piano and scarlet ponies too.

At this very minute people were hurrying past the shop down to Main Street to crowd and push and stand in line for the parade. They were smiling and talking loudly and happily and Silvester knew why they all were gayer than ever before—it was because they were going to see the elephants. There had never before been one single elphant in the town, but this circus was the biggest in the land and it had every animal you could mention. Of course Silvester had never seen an elephant, but he knew they were big, as big as two lions, he thought, and they had long dangling noses, too.

Silvester picked up the star cutter and stamped it into the brown dough. He always made dozens of star cookies for the children seemed to like them best. Finally there was just one humpy piece of dough left and as Silvester looked at it he began to smile.

"I'm going to make a peanut cooky out of this," said he slowly. "And I'll play that the biggest elephant is going to get it. Elephants like peanuts, and they like cookies too—Rannie said so." (Rannie was a boy down the street who traveled far and wide with his father. He had seen just about everything.)

Silvester piled the star cutter and the circle cutter and the animal cutters up against the wall and then he began to mold the peanut cookie. The dough was just the color of a peanut and when Silvester had shaped it fat at each end, and drawn little lines across it, anyone would have thought it was a big peanut all ready to be cracked.

It was fun to watch the hurrying people while the peanut cookie baked, but it wisn't much fun to look up toward Main Street and see the crowd and know that you wouldn't catch even a glimpse of anything and that the biggest elephant would never taste what you had made for him.

The door slammed and a stout lady in a blue checked dress bustled in to buy half a dozen cookies for her little boy so he wouldn't have to have so much popcorn at the circus. Silvester wondered how it would seem to have a mother buy things for him—though of course he'd never have her buy cookies. He counted six stars into a yellow paper bag, but the lady shook her head.

"Give me that funny looking one, little boy. It is bigger, I believe."

It was indeed bigger, for it was the peanut cooky. It had come out of the oven not a minute before and it lay on the table all alone, smelling gingery and sweet. Silvester walked slowly over and picked it up. Into the bag it went, on top of the five stars.

"The crowd's getting big," said the lady kindly, as she hurried to the door. "Better get over there or you won't see anything."

Of course no one would ever think that there was a little boy who wasn't going to the parade, and Silvester didn't tell her. He wound up the ball of string and went out upon the small porch to look up and down. Nearly everyone had gone past. The balloon man was crying down on Main Street and people in back of the others were standing on chairs and boxes, but that was so far away that Silvester couldn't tell one from the other.

He gazed the other way. The road led up a hill in the distance and there wasn't a moving thing in sight—or was there? What was that, trotting smartly over the hill? What was that coming down into the city but a team of four tiny ponies and a cart of yellow with wire wheels which sparkled like silver even so far away! Nearer and nearer they came. A man, bare headed and tall, was standing up in the pony cart and crying loudly through the megaphone:

"Parade will pass this way. Main Street bridge will not hold the elephants! Main Street bridge will not hold the elephants!"

The elephants! The man wasn't down to Main Street before people were thronging back. They crowded the sidewalk before the shop, they hurried along the street, they were everywhere.

Silent with joy, Silvester climbed up on the stool which stood in the corner of the porch. There was no one to wait on in the shop. His head was far above all the others—he was to see.

The steam piano was coming down the hill. It drove slowly past, whistling and tooting so that people swayed a little and stood on tiptoe to see their faces in the mirrors on its sides. Silvester's face was the very plainest; he smiled at himself and at the purple tassels swinging from black harnesses.

Arab men came leading the camels. The men wore robes of blue and gold and their dark heads were bound with embroidered turbans. A band in white marched past and the drummer smiled and nodded at the crowd and tried to

The Cultivator Patterns

BE SURE TO SEND SIZE

3380-3377. A Stylish Costume. — Waist 3380 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3377 cut in seven sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. The skirt measures about 1⅛ yard at the foot. This dress for a medium size will require seven yards of 27 inch material. TWO separate patterns 10 cents FOR EACH pattern.

3391. Girl's Dress.—Cut in four sizes: 4, 6, 8, and 10 years. A 6 year size will require 3¼ yards of 27 inch material. Price 10 cents.

3398. Ladies' Apron.—Cut in four sizes: Small, medium, large and extra large. A medium size will require 3⅞ yards of 36 inch material. Price, 10 cents.

3393. Child's Dress.—Cut in five sizes: 6 mos., 1 year, 2, 3 and 4 years. It will require 2½ yards of 27 inch material for a 2 year size. Price 10 cents.

3369. Ladies' Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6⅝ yards of 36 inch material. The width of the skirt at lower edge is about 1½ yard. Price 10 cents.

3375. Girl's Dress.—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 4⅝ yards of 27 inch material. Price 10 cents.

3037. A Practical Model.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 5⅞ yards of 36 inch material. Width of dress at lower edge is about 2¼ yards. Price 10 cents.

3386. Child's Play Garment.—Cut in five sizes: 1, 2, 3, 4 and 5 years. A 2 year size will require 3¼ yards of 27 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

Los Angeles

wake every sleepyhead in the city. On a big white horse with a snowy flowing tail sat a little girl with gleaming yellow curls. She wore a dress of white lace and Silvester thought she must be a fairy with her wings folded tight.

There was a spotted clown leading a squealing pig, and there was an iron cage of lions who roared and growled and shook their heads. Away up the street four grey mountains were walking slowly. Silvester bent forward and gazed eagerly.

"May I stand beside you?" asked a sweet voice.

A grey haired lady in black was standing on the step. She had such a kind face that Silvester almost forgot the elephants for a second, and hopping down he said:

"I will get you a chair. I don't think —I don't believe Uncle Jeremy would care."

Even though the elephants were nearly there, Silvester ran into the shop and dusted a chair for the lady. He carried it out upon the porch and placed its legs firmly upon the boards. She sat down thankfully and Silvester climbed back on the stool. The last pony had gone and the elephants were coming so slowly. Several people crossed the road to be on the shadier side. The stout lady in the blue checked dress dragged her little boy across.

"Oh! Oh! Oh!" screamed the child. "My cooky! I lost my best cooky!"

But the elephants were coming and there was no time to go back. People laughed excitedly to think that even a small boy would speak of cookies at a circus parade, but Silvester did not laugh, for there, there in the middle of the road lay the peanut cooky.

The elephants wore blankets of rainbow colored velvet—ruby red and lavender, and glistening green and blue. They swung along so that the men who sat upon their fat necks bobbed back and forth. The smallest one with the ruby blanket come first. Tramp, tramp, tramp he went, straight over the peanut cooky without even stepping on it.

Tramp, tramp, tramp came the lavender elephant, shaking his trunk as though he smelled something spicy and good.

Tramp, tramp, tramp came the great elephant. The cooky still lay there while the crowd laughed and cheered. One big front foot just missed it.

Tramp, tramp, tramp came the blue elephant, the biggest of them all—almost as big as the bakery. Silvester leaned forward. Tramp, tramp, tramp went the elephant, and suddenly the peanut cooky wasn't there—it wasn't there because he had picked it up with his long trunk and tossed it plop into his pointed mouth. The biggest elephant was chewing Silvester's cooky.

And the parade was gone. The people straggled happily after it. Silvester looked up into the gray haired lady's face, and his eyes sparkled as he told her all about it. But he had not quite finished when Uncle Jeremy came scuffling through the store. The lady didn't know that he wasn't a real uncle who couldn't be expected to love the little boy, so she said very sweetly:

"May I take your nephew to the circus "

Uncle Jeremy shook his head and said gruffly: "Sorry, lady. He's got to sift a sack of flour for us—been idle too long, I'll bet."

The lady didn't ask again. She said goodbye to Silvester and went out. But he sifted happily for over an hour, for he had seen the biggest elephant smile an animal smile as he chewed something crisp and good.

* * *

But that isn't all.

The gray haired lady was the one who owned all the wheat lands outside the town—if Uncle Jeremy had only known that! She didn't have any child at all and whenever she sat down to breakfast or lunch or dinner alone in her gorgeous dining room, she thought of little pale Silvester sifting flour.

One day her lawyer went to see Uncle Jeremy, and that very afternoon Silvester went to live with the gray haired lady. Someone hired a big fellow to work in the shop, and Silvester learned to read the hardest books and to play the violin and also to love the gray haired lady as though she were his own mother.

But the very best story that Silvester had to tell until he grew old was the story of how the biggest elephant got the peanut cooky.

HINTS FROM HOUSEKEEPERS

Good Fruit Cake

Two cups light brown sugar (1 cup butter or 2/3 cup butter and 1/3 cup Snowdrift shortening), 1 cup sorghum molasses, 1 cup strong coffee, 4 eggs, 4 cups flour, ½ teaspoon salt, 2 teaspoons allspice or cloves, 2 teaspoons cinnamon, 1 teaspoon ground nutmeg, 1 teaspoon soda, 1 teaspoon baking powder, 1 pound raisins, 1 pound currants, ¼ pound candied citron, ¼ pound orange peel, 1 cup chopped English walnuts.

Cream together butter and sugar in large pan, add beaten yolks of eggs and cup coffee and beat vigorously. Put the teaspoon soda into cup of molasses, mix thoroughly, add to other mixture. Add salt, spices, raisins, currants, citron, orange peel and nuts, stirring in one at a time. Stir in one cup of flour at a time and mix thoroughly. Add beaten whites of eggs. The last thing I sift the baking powder over top of cake and stir it in the butter quickly, but do not beat. So often people make the mistake of beating the cake after the baking powder is added.

Place in large bread pan and cook in a slow oven for 2¼ hours. I always test my cakes by sticking a toothpick in the center of cake. If the batter sticks to pick it needs to be baked longer.

This cake is moist and can be eaten immediately or it will keep in stone jar for months.—Mrs. F. H. Merlan, Los Angeles.

Glazed Fruit

Someone asked for this recipe in December Cultivator:

Pick the finest of any kind of fruit and leave on their stems. Beat whites of eggs to a stiff froth, lay fruit in beaten egg, stems upward, drain them and beat part that drops off again. Select them out, one by one, and roll in finely powdered sugar. Cover a pan with sheet of waxed paper, place fruit inside of pan and put in an oven that is cooling. When the icing on fruits becomes firm, pile them in a dish in a cool place. If oranges are to be glazed, remove skin and all white to prevent bitterness. Always choose the best and largest of fruits.—Subscriber, Los Angeles.

Red Cabbage

Shave half gallon cabbage fine, put in a stewpan with a little water and meat fryings, pepper, salt, two tablespoons sugar, a small onion pierced with cloves, one sour apple sliced. Remove onion and stir in apple after boiling slowly.—Mrs. P. Freyman, Del Rey.

UncooRed Apple Candy

To the "Salinas Subscriber": To make apple candy without cooking the apples or candy, beat the white of eggs very stiff, add one tablespoon milk to each white (after beaten), then put in as much powdered sugar as it will take, flavor and work into same; color some with chocolate (melted), etc. Cut apples in dice, oblong, etc.; place inside a piece of this fondant and roll with your hands. Put on platter and dry over night or even a few days. Very nice.—Subscriber, Mountain View.

Butter Coloring

To "Chico Subscriber": Grate large carrot, squeeze juice through cloth. None better.—Mountain View Subscriber.

Spice Cake

This is a dandy little spice cake or fruit cake and can be baked a half hour before dinner and eaten either hot or cold:

Place 1 cup sugar in pan, 1 cup sour milk, 1 or 2 eggs, 1 tablespoon melted butter, ¼ teaspoon salt, 1 teaspoon cinnamon, ¼ teaspoon allspice, little nutmeg, 1 scant teaspoon soda dissolved in milk and mix thoroughly, adding one cup at a time until you have used 3 cups flour. Lastly, I add 1 teaspoon baking powder. Sometimes

PEARL OIL

(KEROSENE)

HEAT AND LIGHT

Like Good Coffee

Like good coffee, a good oil heater *makes* a breakfast. Filled with PEARL OIL its ready heat chases away the chill of the morning and cheers up the whole room. PEARL OIL is clean-burning, without smoke or odor. Economical. Sold in bulk by dealers everywhere

Order by name—PEARL OIL.

STANDARD OIL COMPANY

(California)

When Writing Advertisers Mention California Cultivator

I add 1 cup raisins or 1 cup nut meats. Can be made in large cake pan or makes nice little cakes by using muffin pans and icing them.—Mrs. F. H. Merlan, Los Angeles.

Good Raisin Pie

Line a pie tin with good rich pastry and try this for filling: 1 cup chopped raisins, 1 cup clabber milk or cottage cheese, 1 cup granulated sugar, 1 egg and a pinch of salt. Beat egg until light, add to other ingredients, mix thoroughly. This makes a good raisin pie and the milk or cheese takes away that sickening taste in the raisins. Cover top as for other pies.—Mrs. F. H. Merlan, Los Angeles.

INSURE YOUR TREES AGAINST INFECTION

Your orchard is a valuable investment. To make sure that every tree produces a maximum return, protect pruning cuts or other wounds from infection with PABCO PRUNING PASTE. Ask your dealer. Manufactured by the Paraffine Companies, Inc., San Francisco, Calif.—Adv.

Sweet Potato Pie

In answer to a request in your paper for a recipe for sweet potato pie will send the following, which is very delicious: Two cups sweet potato (mashed), 1 cup sugar and ½ cup butter creamed together, yolks of 4 eggs; add ginger, cinnamon and nutmeg, 2 cups milk. Lastly add the egg whites, beaten well. This will make two pies and can be made from canned potatoes as well as fresh.—Mrs. David Lindberg, Richvale.

HOUSEHOLD QUERIES

Cheap Fruit Cake

Please send me recipe for cheap fruit cake that was in the Cultivator in 1916.—Subscriber, Los Angeles.

The following recipe was given by Mrs. Floy Crosby Smith of Fairoaks in the Cultivator of November 18, 1916. We hope it is the one wanted by our subscriber:

"So often one hears the objection that fruit cakes are not only expensive but rich and indigestible. The following recipe makes an excellent cake which is neither costly nor too rich. Sometimes in place of currants I use chopped dried figs. One cup butter, 1 cup brown sugar ½ pint molasses, 2 eggs, 1 cup sour milk, 1 teaspoon soda, 1 pound flour, 1 pound currants, 1½ pounds raisins, a little citron. Bake as a loaf in a deep pan, preferably two or three weeks before it is to be used."

Another Cure for Poison Oak

I have noticed in your paper several cures for poison oak, and that brings to mind my first acquaintance with it. I was cutting a trail to the mine through thick brush and noticed a black oil coming out of some of the cut roots. I put my finger in it—and found out later it was poison oak. An old granny said to boil the roots and bathe in the water and that would be a sure cure. I tried it on one arm and the effect was wonderful — it nearly killed me. I suffered for three weeks, trying other remedies suggested, sometimes wishing somebody would tell me to swallow a stick of dynamite with a fuse attached to it. Then a friend wrote me to try an emulsion of ammonia and soda. It seemed rather late in the game to use ammonia—on raw flesh. I did though, commencing on one arm and gradually putting on all of the afflicted parts, and it commenced healing almost instantly. Do not bathe until you are well of the itching, then you will find that it will peel off and you will have new life. Since I used it I want to tell everyone. The other day, while passing through the suburbs I noticed an old lady leaning on her staff and scanning the street for a clear passage between automobiles. Finally she made it across, and as she turned around something flashed by at about 50 miles an hour, and, stamping her old staff on the walk she said: "You hell devil, where you come from?" And that's what I say about the oak when it appears on me.

ABSOLUTE DISPERSAL

Jas. J. Jeffries Herd

65 REGISTERED HOLSTEINS 65

Burbank, California

Thursday, February 3, 1921

INCLUDING:

BARON ANNABEL LILITH, over 38 lbs. butter in 7 days, the highest 7 day record cow ever sold in California.

MAID TUEBIE SEGIS, 1140.95 lbs. butter from 28,343.28 lbs. milk in one year the highest yearly record cow ever sold in California.

KING SEGIS PONTIAC JANNEK, the great proven son of King Segis Pontiac, an outstanding individual and sire of outstanding individuals.

FORTY DAUGHTERS OF KING SEGIS PONTIAC JANNEK, including all of the sensational show ring winners at Los Angeles.

A BEAUTIFUL LOT OF 29 AND 30 POUND COWS, several on yearly test, will finish right at or above the 1000 lb. mark.

THREE YOUNG BULLS, one a son of Baron Annabel Lilith, one a son of Maid Tuebie Segis, both of these sired by King Segis Pontiac Jannek. The third bull a son of Sir Ormsby Skylark out of a 30 lb. dam.

A SPLENDID LOT OF YOUNG COWS with records from 22 to over 28 lbs. butter in 7 days, some now making big yearly records.

IF YOU WANT THE GOOD KIND, DON'T MISS THIS SALE!

BREEDERS—Don't wait until sale day to form your companies to buy King Segis Pontiac Jannek. He is widely rated as the greatest proven sire yet offered at public auction in California, and there are many combinations of breeders in California who could well buy and use him at the price he is worth.

Every animal positively guaranteed to be a breeder; every animal Tuberculin tested and sold subject to retest by the buyer.

REGISTERED
60 GUERNSEYS 60

AT PUBLIC DISPERSAL

Revada Ranch, Yountville, Cal.

Thursday, January 20, 1921

This is an absolute dispersal of the well known Revada Herd of registered Guernseys, founded by B. E. Nixon, and now owned by Mission Land & Cattle Co., who will devote the ranch to other purposes.

IMPORTED FEMALES—The herd contains a number of imported females, including daughters of such famous sires as Governor of the Chene, Raymond of the Preel XIII, Robert's Secret, and others of corresponding merit.

THE HEIFERS—Bred and open heifers, and heifer calves comprise a large percentage of the offering. Many of these are out of imported dams, and by such sires as Auricle's Cherub of Edgemoor, Imp. Ricardo of Edgemoor, Itchen Daisy May King of Langwater, and other sires of most desirable breeding.

THE BULLS—The offering of bulls marks a most important event in the affairs of the Guernsey breed in California, for never before have so many bulls of the breed been offered at public auction in the state. The sale list includes a number ready for service, others nearly ready, and some very choice bull calves. Included in the list are several sons of Itchen Daisy May King of Langwater, brought to Revada Ranch at the then world's record price of $8000.00. There are bulls in the list that should offer desirable selection to both breeders and dairymen.

Every animal positively guaranteed to be a breeder; every animal over six months old Tuberculin tested and sold subject to retest except as announced in sale ring.

Good Prospects for Hog Raising

By J. P. Bennett

TO make any definite predictions as to the future market conditions and demand for pork and pork products one would need to be possessed with a sixth sense. However, since history repeats itself, the past is a very good guide by which we may gauge the future. We may think what we like upon this subject, but there really are times when the law of supply and demand controls market conditions. This is nearer true at the present time than it has been during the past few years of exorbitant prices, senseless buying and wild investments when the speculative demand dominated market values. We are now emerging from an era which we will have to disregard in adjusting our ideas to the new price levels on which we are to base our future operations. Several things combined to bring about this situation: the unsettled condition resulting from the World War; the unusually high price of grains, caused not so much by the actual shortage as by manipulation of speculators on the large grain markets; the low pork prices, caused largely by the cessation of buying orders from the European countries; the general tightening of money and shutting off of credit—all have contributed to affect the profit rightfully expected from pork production.

The average farmer is the really big factor in pork production, and whenever the ratio between grain and pork prices does not yield a profit he suspends operations until conditions adjust themselves. A good share of the time during the past few years the man with grain to spare could cash it for a greater profit than hog feeding could possibly produce. However, that time has passed. The low market price of grain and the difficulty of selling makes the business of producing pork more attractive than it has been for some time. True, the price of pork has declined, but not in the same ratio that grain and many other farm products have dropped.

The withdrawal of the small farmer from the market dealt a severe blow to the breeder of pure bred hogs just at a time when the breeder was needing strong support. The general prosperity of the country at large during the past few years affected the pure bred industry and attracted many men who were neither qualified nor prepared for the business. The influx of these men without knowledge of values or the fundamental principles of breeding, buying many animals far above their real worth, caused prices to soar. The effect is too well known to need comment. Generally speaking, it was the men who rushed blindly into the business who were the first to try to unload on a weakening market. However, the man who kept his operations on a conservative business basis has sustained comparatively small losses.

The present ratio of pork and grain will yield a profit for the feeder, and the hog industry looks brighter for the farmer than it has in years. There is bound to be a strong demand for breeding stock prices on a business basis to restock the depleted herds on the farms, hence the breeders might well be making their plans to handle the situation. There are few, if any, farms that will not show an added profit when at least a few hogs are kept. They will fit into most any system of farming operations, consume the waste from the farm, convert it into cash and assist in conserving the fertility of the soil. This in itself is worthy of consideration as one of the most serious agricultural problems confronting us—the conservation of soil fertility. The best method of doing this is by feeding as much of the farm crop as possible into farm animals and using the manure to good advantage. The high price of commercial fertilizers and the ever increasing need for them should make the land owner realize the value of manure as a by-product of the farm. In some parts of the state manure commands such a high price that it can be considered quite a valuable asset. Barnyard manure is nature's best fertilizer and should be given greater consideration than it is receiving. Many of the cover crops could be pastured part of the year with hogs and the same result obtained in humus supply as well as additional fertility at a profit. As agriculture progresses and develops, this need will become more and more acute. The man who will be prepared is the man who plans ahead to meet the growing demand.

The present outlook for the pork producer and the hog breeder is much brighter than it has been in some time. It will be necessary to adjust ourselves to a new scale of prices in order to meet the present situation.

The breeding herd should be maintained on as near an economic basis as possible. It would not be well to underestimate the worth of a valuable herd boar, the addition of sows to strengthen the foundation herd, or neglect to feed adequately in case of preparation for the show ring, but the bulk of the herd can and should be handled on such a basis that if the demand for breeding stock is lax the animals can be put across the scales and still show a neat profit. More attention should be paid to the selection of breeding animals and greater discrimination made in animals maintained in the herd and a larger per cent sold for pork. Indeed, every pure bred producer will do well to bear

this fact in mind: pure bred livestock of all kinds is capable of making a profit because such livestock is efficient. If a breeder cannot make his stock show a profit he certainly can not expect it to prove satisfactory to the average purchaser. The time should have arrived long ago for the breeder to get his operations on a profitable basis. If he can show that his herd is making him money, he will have little difficulty in selling to his neighbors. On the other hand, if his herd is losing him money he can hardly expect to gold brick the public.

The present deflation from which the hog industry is suffering is only a recurrence of conditions that have occurred on an average of every ten years since the pure bred hog business was founded, and tend to prove that present conditions will readjust themselves. The business of pork production is of too much importance to be permanently affected by temporary fluctuation in prices.

THE SERIOUSNESS OF A NAIL PUNCTURE

Large wounds inflicted in the horse, regardless of their location, ordinarily are regarded as very serious. As a matter of fact, the small puncture wounds of the foot, inflicted by nails or other small objects, do immense damage by causing to be set up in the foot imflammatory conditions which in many instances render the animal useless.

When the anatomical structure of the horse's foot is taken into consideration, the reasons for serious apprehensions regarding wounds of any kind to the underlying soft tissue are quite apparent. Briefly, the gross anatomy of the horse's foot consists of inner bony structures and the outer surface of a rather resistant horny box or covering. Between these two structures are found the soft tissues, varying in thickness, and extremely vascular. The soft tissues are quite susceptible to the growth of certain kinds of bacteria which gain entrance to them through wounds. The facts to be considered with regard to foot injuries are the nature of the wound, the anatomical structure of the foot, and the introduction of harmful bacteria into the wound.

When a nail or other object penetrates the hoof there is set up in the soft vascular tissue inflammatory processes produced in the first place by the penetrating object, and later, as a rule, continued to a greater extent by septic processes induced by the action of bacteria.

Considering that a number of horse owners apparently do not realize the seriousness of nail punctures, which they quite often treat in a rather careless way, prompts a few remarks on this topic. Severe lameness appearing suddenly is an indication of nail puncture which should not be difficult to recognize. Observation, however, often reveals that the cause is not discovered until some time after the injury has occurred. Many people handling horses give but little attention to the foot in a case of lameness, but look for the seat of trouble elsewhere. In view of this fact the division of animal industry advises that considerable attention should be given to the foot for the seat of disturbance, especially when lameness develops suddenly.

In making an examination of the foot for wounds the under surface should be scraped thoroughly clean and careful observations made for any evidence of blood which may exude from a wound. After this procedure, if no puncture is found, a thin layer of the superficial horn should be shaved off, preferably with a sharp farrier's knife. This is done for the reason that an almost invisible wound orifice may be more readily detected on the smooth surface produced by trimming. When seeking the wound small discolored areas should be shaved off in order to make sure that they are not extending inward, and it should be borne in mind that the puncture is frequently presented as a small dark spot from which blood or inflammatory products may be oozing. A light tapping or squeezing of the hoof may aid in locating the wound. When a puncture wound is located the treatment applied depends upon its location and the nature and extent of the injury. In all cases of penetrating wounds of the foot the first logical procedure in applying treatment is to see that no foreign particle remains in the wound.—S. O'T.

CANADA'S EXHIBIT AT CHICAGO

One of the most interesting sights at the International Livestock Show at Chicago was the evening parades of horses and cattle. As the Canadian section of these parades came into view, and as it passed around the ring, there was continued applause. There were two or three reasons for this, the principal one being that in this section there were the wonderful Clydesdales, the Belgians and the Percherons that had carried off championships and first prizes. The province of Saskatchewan had a splendid display of Clydesdales and showed in a number of classes, and in every class they got in the money. A remarkable and noted winning was that of the University of Saskatchewan, showing Lady Bruce, female Clydesdale, in a class of 24 and taking second. In competition there were entries from such famous studs as Conyngham Bros. of Wilkesbarre, P. L. James of Easton, Massachusetts, and George Chiett of the same state.

The following are some of the good things that Canada won at the International, in a fair fight and no favors: Grand championship for Clydesdale stallions; championship for American bred Clydesdale mares; reserve senior and reserve grand championships for Clydesdale mares; grand championships for Southdown sheep; Sweepstakes grand championship for wheat for the continent of America; championship for Durum wheat for America.

CEREAL PLANTINGS AT UNIVERSITY

By G. W. Hendry

Several new and improved cereal varieties are being grown on 200 acres of fallow land at Davis this season. Hard Federation wheat, which is expected largely to replace other wheat varieties in many of our grain districts within a few years, will be distributed from Davis for the first time next summer. Burt oats, which has many good qualities and an enviable record to recommend it, is another one of the headliners to be sent out for the first time next season. Peacock barley, an improvement over the old two row Chevalier barley, has been developed especially for the Salinas Valley and will be grown there for the first time next season. Visitors at the university farm this spring may have the pleasure of inspecting a 40 acre field of Mariout barley which tests 100 per cent in purity. Never before has this been seen in California. Several large plantings of Four Thousand barley are also to be made. This new pedigreed barley is ten per cent more productive than common barley and is increasing rapidly in popularity. A number of standard wheat varieties are also being grown in pure cultures.

FARM ACCOUNTING SCHOOLS

Several farm accounting schools will be held in various parts of the county by Prof. R. V. Wright, farm management demonstrator for the state college of agriculture. At these schools special attention will be paid to income tax returns required of farmers, and new forms for keeping farm records will be demonstrated and explained.

A few minutes invested in putting machinery under cover and oiling the bearings pays good dividends.

It is not at all safe to hire a stenographer that knows less than three times as much as you do.

"Kindness," says Victor Hugo, "is the sunshine of the spiritual world." The most of us know where the shadows come from.

Life is made up not of great sacrifices or duties, but of little things in which smiles and kindness and small obligations, given habitually, are what win and preserve the heart and secure comfort.—Humphrey Davy.

History Repeats Itself

There is a story that is repeated nearly every working day of every year, on the pages where the records of public sales are kept, a story that if analyzed proves to be only a true record of the results that must certainly follow any breeding herd of registered Holsteins built along similiar lines.

KING KORNDYKE PONTIAC

His sire, KING OF THE PONTIACS, with 268 A. R. O. daughters, outranks any other bull of the breed in this respect, and among them are 40 with yearly records, including five that have over 1,000 lbs. butter. His presence in any pedigree lends strength, and his worth is too well known to require further description here.

His dam, MAY KORNDYKE 2ND, made 776.46 lbs. butter from 18,868.9 lbs. milk in one year as a 3 year old, a record that does not truly indicate her capacity, as she was a cow of wonderful capacity and splendid type, but unfortunately never had an opportunity to show what she could do in mature form. Her dam was for many years the youngest 30 lb. cow of the breed. She is by the same sire as Prince Gelsche Walker, and is therefore half sister to the dam of Carnation Pietertje Segis Prospect, who recently broke the world's yearly record with a production of over 37,300 lbs. in one year, and also made over 1,440 lbs. butter the third highest record.

KING KORNDYKE PONTIAC was not bred by us, but was calved in our ownership, raised by us, and then used as one of our herd sires, at a time when we were using so many sires that no one of them had an opportunity to produce a large list of daughters. He sired the $12,000.00 bull King Korndyke Pontiac 20th, who in turn sired the $41,000.00 bull King Korndyke Pontiac Acme, subjects of our two previous announcements in this series.

We regard KING KORNDYKE PONTIAC as one of the most valuable breeding bulls in California, with unquestionably great production in his pedigree. He himself has 15 A. R. O. daughters, one of which recently made 31.12 lbs. butter from 623.1 lbs. milk in 7 days. He has a large list of young daughters yet to freshen, a number of which will no doubt be heard from this winter, and they are a most pleasing group of excellent individuality.

KING KORNDYKE PONTIAC is now owned and in active service in one of California's largest high class herds, at Jane Garden Farm, owned by

FRED W. KIESEL

SACRAMENTO CALIFORNIA

It is the story of the breeder who founds his herd upon good, average, substantial females. In their development one or perhaps several outstanding producers and breeders are established, and upon these and their female offspring the larger foundation of the herd is laid.

Then one day comes the reason for the dispersal of the herd, and the various individuals composing it are exposed to the critical appraisal of buyers at the public sale ringside. The good cows find ready bidders at most substantial prices, but the heifers out of these good dams go begging, and often the owner can not understand the process by which buyers rate his great producing cows so highly and the next minute place so low a valuation on their daughters.

But the whole story is on the catalog page, where everyone may read, in the sires of the heifers. It tells the story in actual words of how a foundation of well bred, high producing cows were mated with a bull of inferior or unattractive breeding, detracting largely from the value of every heifer he sired out of a good dam. An investigation of the beginning of the story will often reveal the fact that the original purchase price of the herd sire was less than was paid for any one of the foundation cows. And that sort of a bull was responsible for one-half or more of the value of every calf he sired.

Will history repeat itself in your herd? Or will you decide right now to lose no more time in placing at the head of your herd a sire not only backed by large production records, but also representing the blood lines that have been thoroughly proven in great yearly production, and are so well and favorably known that they meet with keen demand in any sale event?

Perhaps we may be of assistance to you in solving your herd sire problem. We have developed a number of outstanding families of yearly producers, and have blended them in some matings that are proving highly satisfactory in the hands of many good breeders and dairymen.

Our knowledge of the quality of several generations of ancestors behind the bulls we have to offer is at your service. Correspondence is invited if you are unable to visit our herd.

CHAMPION GUERNSEY

RECORD: 19,306 Lbs. Milk

The real facts on Big Milk Production

THE function of milk-making depends so entirely on the health and activity of the vital organs directly concerned, that the slightest loss of vigor in these organs affects at once both the quantity and quality of the yield.

Because Kow-Kare so quickly reaches and builds up the organs of production, it is fast becoming as generally used as an aid to production and a PREVENTIVE of ills as for its fundamental use in treating disease.

Most cow diseases—such as Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite, Bunches, arise in an impaired condition of the digestive or genital organs. It is just these organs that Kow-Kare is designed to build up and restore.

Feed dealers, druggists and general stores sell Kow-Kare; 70c and $1.40 packages.

DAIRY ASSOCIATION CO.
LYNDONVILLE, VT.

NOTE: The trade-mark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of BOTH the PREVENTIVE and CURATIVE qualities of the remedy.

Cattle Prospects to Date

By A. L. Spellmeyer

THE relief promised by the emergency tariff bill is the first attempt at remedial legislation the cattlemen have experienced. Many folks do not know what it means, but there is a stiffening already in cattle holdings that will soon be reflected in the Kansas City and Chicago market quotations, if the measure passes. From the appearance of the Middle West market (and this statement is made when it looks as if the emergency tariff was certain to pass over the presidential veto if necessary), it looks as if the insiders thought it would not pass. If the opinion exists that this emergency measure would go through soon, it would seem that there should have been stronger prices for lambs and Chicago beef.

An ad valorem tariff on meat would stop importations of beef and mutton from Argentine or Australia. A duty on cattle would cut down the fat cattle from Canada and the stockers from Mexico which still come through.

If the war corporation measure is applied to a practical purpose there will be activity in cattle circles as money is the present cause for forced liquidation.

With a national slaughter exceeding 20,000,000 cattle and calves yearly, a certain dwindling of the 44,000,000 beef cattle supply we are supposed to have in the census about to be published, cattle should come to a living profit basis for producers very shortly if producers get money and get protection from cheaper foreign meat.

The regulation of the packers is still a matter agitating the legislative bodies; the nation is demanding cheaper food, and retailers are yielding to the universal clamor for less profiteering. A drop in retail meat prices cannot injure meat producers but will be of much benefit inasmuch as it will increase volume consumed.

As far as California is concerned several things have come to pass. The cattlemen have organized to financially care for any temporary excess in supply which would permit market manipulation. The 40,000 per month necessary to supply California alone will make killers hunt hard for beef until the April and May cattle volume starts. The indications are that fed steers may go to 12 cents within two months and that there may be a disruption in the Vernon killer ranks, either through desire to profit or the realization that certain practices will not be much longer permitted by a people or its lawful representatives. At present the South has more beef in sight than the north in fed stuff, but the north has early grass beef prospects. The San Francisco men have been working far south and within a month the Los Angeles men will be working far north.

California has had good rains and has every guarantee of early beef. In Kern County, however, which has the most of any California county in cattle and the bulk of steers of age to make the desirable weights of grass beef, the year has been backward. The large lots of steers are going to come on slow and that will help the cattlemen to a price.

If the Chicago market and the Kansas City market see money and cattle shortage there will be a May or even April run on the California half fat steers to finish on Kansas and Texas spring and summer pastures. Proportionately, we have more than our share of steers. Although the nation is killing 12 to 14 million steers and cows yearly, it is very doubtful if there are 8,000,000 steers in the entire nation. The fact that even Kansas City low prices, netting only $18 to $23 for the kind of good yearling steers which usually sold at $40 to $50, did not make the districts which supply range yearlings drop below $35 for the same kind is in itself significant. The $35 yearling steer is still on the ranges and when a yearling sells for $35 there won't be any surplus $35 to $40 cows very long.

In fact, there is every reason to believe now that fall shipments are about through from the cold districts, that a California cow will in 60 days, irrespective of the beef price, again resume a $60 to $75 value.

The fact cannot be denied that there is a general feeling out for cattle starting in California, a more or less quiet confidence that cattle will be in demand, and a general trend to ten cent grass beef, with possibly more if shortage affects us.

It is realized that retailers cannot continue their enormous profits gross and that lower prices to consumers must mean more beef eaten. The cowmen feel that the reactor cow will not be a competitor against the beef animal much longer and that the possibilities in remedial legislation, finance, and range grass all bring a possible advance until a living profit can be secured.

DAIRY SHORT COURSE

The first annual dairy short course will be given under the auspices of the argicultural extension service, California Dairy Council, and the dairyman's department of the Los Angeles County farm bureau at Downey auditorium, January 3, 4 and 5; Van Nuys high school, January 4, 5 and 6. At an afternoon session in each course there will be a cow judging demonstration and judging classes. Another afternoon will be given over to the holding of a postmortem examination on a tubercular cow.

Similar courses will be held at Ontario and Riverside, January 7 and 8.

Following is from the program: Downey, January 3, and Van Nuys, January 4, 9:30 a. m.: Relation of the Agricultural Extension Service to the Dairy Industry, Robert W. Hodgson; Breeds and Breeding, W. E. Tomson, U. C.; Selection of the Herd Sire, B. C. Bougher, assistant farm adviser Los Angeles County; Building Up the Dairy Herd by Cow Testing, C. V. Castle, U. S. D. A.

Afternoon, Downey, (L. A. Co. Farm), Van Nuys, (Adohr Stock Farm), 1 o'clock: Cow Testing Methods, G. E. Gordon, assistant farm adviser, Geo. E. Knight, head cow tester; Cow Judging Demonstration, F. H. Scribner; Dairy Cow Judging, in charge of G. E. Gordon.

January 4, at Downey, and January 5, Van Nuys, 9:30 a. m.: Does the Dairy Industry Need a Publicity Department? Sam H. Greene, Dairy Council; Dairy Equipment and Sanitary Milk Production, Dr. C. F. Hoyt, superintendent dairy inspection, state department of agriculture; Contagious Abortion, Dr. J. P. Bushong, Los Angeles city veterinarian; Tuberculosis, Dr. F. B. Wilcox, deputy state veterinarian; Postmorten Examination of Tubercular Cows, Drs. Bushong and Wilcox.

Downey, January 5, Van Nuys, January 6, 9:30 a. m.: Dairy Farm Crops, Prof. P. B. Kennedy, U. C.; Business Principles Applied to Dairying, C. V. Castle; Dairy Produce Markets, Sam H. Greene; Feeding Dairy Calves, C. V. Castle; Feeding the Dairy Cow, Prof. W. E. Tomson; Rations Employed by Los Angeles County Dairymen, G. E. Gordon.

THE J. G. THROCKMORTON BERKSHIRE SALE

The sale of Berkshire hogs held by J. G. Throckmorton, Sebastopol, Saturday, December 18, was fairly successful. Owing to rainy weather the crowd was smaller than expected. This, together with a total lack of breeders' support, had quite a tendency to hold values down. However, an average of close to $50 per head on everything of breeding age was as much as could be expected under the circumstances. Every hog sold went to the farmers and dairymen around Petaluma, Sebastopol and Santa Rosa. Col. Geo. W. Bell, Tulare, was on the block and sold the offering in his usual satisfactory manner.

CHOOSING

Life is short—too short to get everything. Choose you must, and as you choose, choose only the best—in friends, in books, in recreation, in everything.—Museologist.

Livestock News Notes

HIGH RECORDS IN THE GIBSON HERD

Several noteworthy official records have just been completed in the herd of registered Holsteins owned by the J. S. Gibson Company, Williams. Aaggie Korndyke of Nevada, a mature granddaughter of Pontiac Korndyke, started on test 30 days after calving, made 30.19 pounds butter from 704.3 pounds milk in seven days. Her dam is a daughter of Aaggie Cornucopia Johanna Lad, sire of Winnie Korndyke Cornucopia De Kol, the great Gibson cow that was the first in California to make over 1,200 pounds butter in one year. Princess Roma Alcartra, daughter of the Gibson herd sire, Prince Alcartra Korndyke, he a son of Tilly Alcartra, made 30.01 pounds butter in seven days from 702.6 pounds milk, while her full sister, Roma Princess Korndyke Alcartra, as a senior two year old has to her credit 22.01 pounds butter from 407.7 pounds milk in her first seven days. Of interest to a wide circle of breeders is the record of Queen Pontiac Charlotte Korndyke, whose record of 321.12 pounds butter from 623.1 pounds milk in seven days ranks her as the highest record daughter to date of her sire, King Korndyke Pontiac, the great son of King of the Pontiacs, now owned by Fred W. Kiesel, Sacramento. As nearly everyone knows, this bull is the sire of the $12,000 Burr Farm bull King Korndyke Pontiac 20th, who in turn sired King Korndyke Pontiac Acme, the $41,000 bull owned by Anita M. Baldwin. Another Gibson cow, Sigma of Linwood, made 25.08 pounds butter from 569.1 pounds milk, and milking with one teat so badly cut that a milk tube had to be used during the test. A noteworthy feature of the above records is the splendid flow of milk present in each instance.

PURE BREDS FOR SOUTH AMERICA

American pure bred animals to the value of $400,000 were sold in South America during the first six months of this year, and livestock commissioners sent to South America to develop the American pure bred industry in that country report that the field is very promising. Even in out-of-the-way places where transportation facilities are poor, purebred hogs and high grade and pure bred bulls have been found by the commissioners. At Lavras, a town about 250 miles northwest of Rio de Janeiro, there is an American mission college whose farm contains pure bred Duroc-Jersey hogs and Brown Swiss and Holstein cattle, the foundation stock of which was imported from the United States.

Most of the cattle in the State of Minas Geraes, one of the important stock raising sections of Brazil, are dairy stock showing considerable Holstein blood. The cows are milked once a day and produce on an average about three quarts of milk. The commissioners are of the opinion that this production could be materially increased by better feeding and more scientific handling of the cows.

According to reports received by the bureau of markets, the outlook for the future marketing of American pure bred livestock in South America would seem to be particularly good, if it is properly developed, and the commissioners are doing everything possible to encourage the business.

FRAMPTON BROS. BUY SON OF KING KORNDYKE PONTIAC 20TH

Southern California added another star to its list of great Holstein sires recently when Frampton Bros., Artesia, purchased from W. J. Higdon, Tulare, a son of King Korndyke Pontiac 20th, the $12,000 Burr Farm bull, out of Trout Brook Pontiac Starin, who made 35.47 pounds butter in seven days, 129.59 pounds in 30 days, and is now making a yearly record that promises to go over the 1,000 pound mark. The dam is by a son of King of the Pontiacs and out of a cow bred strongly in the lines that produced Riverside Sadie De Kol Burke, former world's yearly record milk producer. The youngster secured by Frampton Bros. is a straight, well marked calf with plenty of middle, and brings to the Frampton herd a line of breeding that is fast being introduced into the herds of some of California's most substantial and far sighted breeders.

LIVESTOCK SALE CALENDAR

Holsteins

February 3, James J. Jeffries, Burbank.
February 5, W. A. Thompson, Hynes.

Poland Chinas

February 17, Bassett, Ross & Crawshaw, Hanford.

Berkshires

February, Italian Vineyard Co., Guasti.

Durocs

February, Falfadale Farm, Perris.

Percheron Horses

February 17, M. Bassett, Hanford.

Sam H. Greene, secretary of the California Dairy Council, announces a series of dairy meetings to be held in Southern California, December 31 to January 8. The meetings will be conducted cooperatively by the college of agriculture, the state department of agriculture and the California Dairy Council. The first meeting will be held at Balboa Park, San Diego, Friday, December 31. A three day meeting will be held at Downey, January 3, 4 and 5. A meeting of equal length will take place at Van Nuys, January 4, 5 and 6. The Riverside meeting is scheduled for January 7 and 8 and the meeting at Ontario will be held at the same time.

The Sutter Basin Company, which has one of the largest herds of Duroc-Jersey hogs in the Sacramento Valley on its 45,000 acre tract north of Sacramento, recently purchased four herd boars. One of these came from the held of Harvey Berglund of Dixon. This boar was a prize winner at the last state fair in Sacramento. Also the purchase included a senior boar pig and two spring boars from V. L. Dolcini of Davis. These last were sired by the grand champion at the recent state fair. Agricultural Superintendent A. R. Waybur reports that good litters are being obtained from the sows and gilts at the hog farm and that the hog raising department is making a nice profit.

An important meeting of veterinarians will be held at the university farm, Davis, January 3 to 7. An extensive program has been arranged for the five days and some of the leading veterinarians of the United States will participate. Aside from special lecturers, members of the veterinary divisions of the University of California and the University of Nevada, members of the state department of agriculture, members of the faculty of the college of agriculture and local practitioners will appear on the program, which will consist of lectures and demonstrations. While the event is of particular interest to the professional men, an invitation has been extended to all who are engaged in livestock production.

Harvey M. Berglund of Dixon has recently sold three Duroc-Jersey bred gilts to Stanley Rodgers of Davis, who is developing a herd of pure bred Durocs as a commercial proposition; two bred gilts to Carl Hess of Dixon; a service boar to William Chase of Adin and a young boar, a litter mate to the fourth prize senior boar at the last state fair, to the Boys Pig Club at Petaluma.

Three thoroughbred stallions have been placed in Modoc County by the United States war department and their services will be available to the ranchers of that section. The department hopes to encourage the production of horses suitable for army use.

Allen Rae of Modesto has purchased from J. W. Lorenz of the same place 12 Holstein females at an average price above $400.

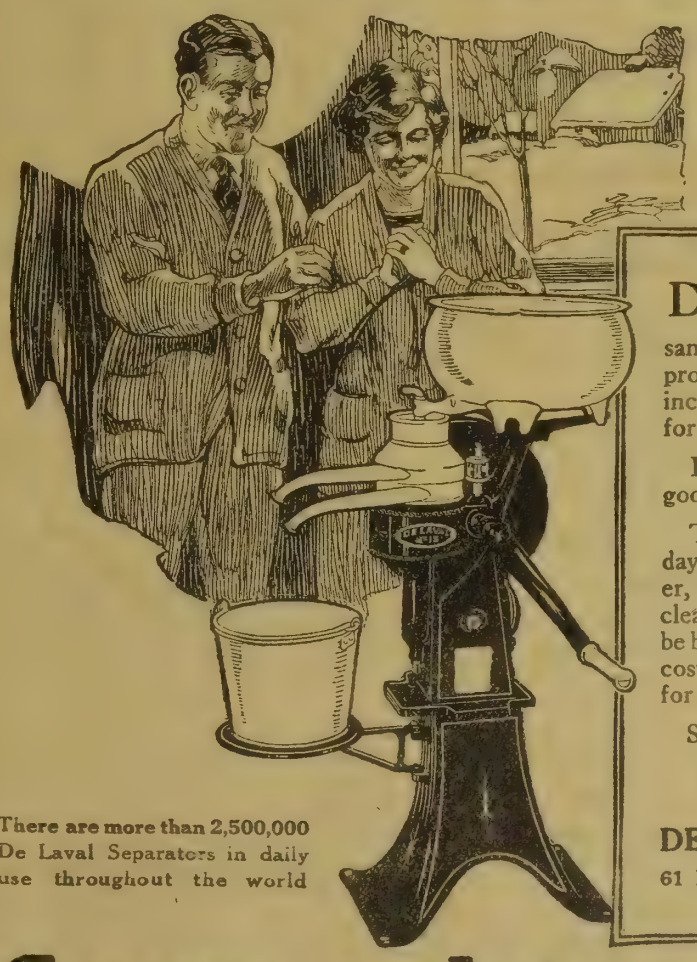
Holstein breeders in Nevada plan to organize a state association for the purpose of extending the influence of the breed in the Silver state. There are now about ten herds owned in Nevada and most of these herds have been founded with purchases made in California sales. Professor V. E. Scott of the University of Nevada is largely responsible for the growth of the Holstein industry of his state.

The sale of Poland China hogs scheduled for December 15 by R. J. Yates, Orland, has been postponed until January 5. This was made necessary by the extremely rainy weather that has prevailed in the Sacramento Valley.

Les McCracken, Ripon, has definitely decided on January 24 as the date of his sale of registered Poland China sows and gilts. He will sell 30 head, the tops of 200. The sale will include King's Big Bone Leader, grand champion at Sacramento in 1918 and sire of the 1920 champion, also Waukeen Prospect, the gilt Les paid $1,100 for over a year ago. She has a fine litter by King's Big Bone Leader and three of her boar pigs will be sold in the sale.

Manager H. W. Hanman of Sierra Vista Vineyard Company, Minturn, re-

They're starting right with a De Laval



There are more than 2,500,000 De Laval Separators in daily use throughout the world

DAIRYING with a De Laval Cream Separator has brought prosperity to many thousands of users. No branch of farming is so surely profitable as good dairying, with its steady cash income every month in the year and no waiting for crops to mature.

But the cream separator means everything in good dairying and either saves or wastes cream.

The De Laval saves cream twice a day, 365 days a year. It skims cleaner; produces smoother, better cream; lasts longer, and is easier to clean. It pays for itself the first year, and may be bought on such liberal terms as to save its first cost while being paid for. There is a size for every need.

Start the new year right with a De Laval.

There is a De Laval Agent near you.
Ask him for a De Laval demonstration.

DE LAVAL DAIRY SUPPLY CO.
61 Beale Street San Francisco

Sooner or later you will use a De Laval Cream Separator or Milker

ports the purchase of two yearling Berkshire boars from A. B. Humphrey, Escalon. It is the intention of the Sierra Vista Company to put their swine herd of several hundred head on a pure bred Berkshire foundation.

Alex D. McCarty, Modesto, reports sale of Liberator Len to the Cloverdale Farm, Escondido, recently. This boar was a September yearling and was sired by Liberator.

The dairy department of the Fresno County farm bureau has organized a cow testing association with more than 1,000 cows entered.

E. Lovell, manager of the Blackhawk Ranch, Diablo, has arrived at the home ranch with the first importation of Shorthorn cattle ever made direct to this state from Scotland. Included in the importation is the young bull, Collynie Prince Lavender, secured in the Duthie sale. This calf is the only Duthie bred bull owned in the West and is one of the very few from that noted herd in any American herd. Lovell states that the cattle came through on their long journey in fine condition. The shipment was held up 30 days in quarantine upon landing at a Canadian port.

Bassett Bros., Hanford, have recently received a young Poland China boar sired by the popular Eastern sire, Designer. This firm owns one of the very oldest Poland China herds in the West, and the fact that they are continually strengthening their herd while many breeders are restricting their operations can be regarded as significant. As usual, they are preparing a sale offering to be sold early in February.

Col. Tim Anspach of Sacramento says that farmers of the Sacramento Valley are evidencing more interest in hogs than he has noted in the past year. At a recent auction of pure bred Durocs conducted by himself and Col. Bell of Tulare a large crowd of ranchers absorbed the offering in short time and at prices that were regarded as very satisfactory. Col. Anspach finds that many owners of grain are planning to market their holdings through hogs and that they figure they will net from two to two and one-half cents per pound for the grain.

Eldorado County farmers have launched a small abattoir and packing plant by means of which they expect to solve many of their local meat and livestock problems. About $30,000 has been invested in the enterprise.

Jersey breeders of San Luis Obispo County have organized an association for the promotion of the breed in that locality. The membership embraces nearly all of the owners of Jerseys in the county. Miss Sylvia Stornetta is president and W. C. Day is secretary.

The first consignment of Holsteins, numbering 700 head, to be sent from this country to Germany arrived at their destination early last month. The cattle were "donated" by various interests and title will be retained by the donors so that they will not be included in the cattle levy demanded by the Allies.

Toyon Farms Association reports the death of their great Holstein cow, Cascade Fleta Johanna, that was the second cow to ever make a 30,000 pound record under full age. Her record of 30.012.30 pounds of milk and 956.12 pounds of butter was made at the age of four years. She was shot following an accident in which her leg was broken. Cascade Fleta Johanna was sired by Johanna Colantha Champion.

C. C. Ellis of Lindsay has purchased the entire Duroc breeding herd of the Arenal Ranch owned by Dr. E. Avery Newton. Mr. Ellis intends to have one of the largest Duroc plants in the West before long.

VETERINARY WEEK AT DAVIS

Veterinary practitioners week will be held from January 3 to 7 at the university farm, Davis. The program for the entire session follows:

Monday, January 3, 10:30: Address of welcome by an officer of the university; response, W. A. Boucher; 11-12, "Swine Management," A. T. Kinsley; 1:30-2:30, "Feeding Hogs," J. I. Thompson; 2:45-3:30, "Organization and Functions of the State Department of Agriculture," G. H. Hecke; 3:45-5, "Diagnosis of Swine Diseases," A. T. Kinsley; 7:30, symposium on cattle practice; "Foreign Bodies and Impaction of Rumen," J. L. Tyler; "Mammitis," J. F. McKenna; "Obstetrics," Charles Rey.

Tuesday, 8:30-10, "Judging Sows," E. H. Hughes; 10:15-12, "Hog Cholera Serum and Its Use," M. Dorset; 1:30-2:30, "The Pure Food Law in Relation to Stock Foods and Tonics," C. H. McCharles; 2:45-3:45, "Plants Poisonous to Livestock," P. B. Kennedy; 4-5, "Parasitic Diseases of Swine," A. T. Kinsley; 7:30, "Filterable Viruses," M. Dorset.

Wednesday, 8:30-10, "Judging Boars," E. H. Hughes; 10:15-12, "Diseases of Suckling Pigs," A. T. Kinsley. 1:30-2.30, "Infectious Abortion in Swine," F. M. Hayes; 2:45-5, "Botulism," K. F. Meyer and J. C. Geiger. 7:30, special meeting of California State Veterinary Medical Association; smoker.

Thursday 8:30-10, judging beef cattle, dairy cattle and sheep, R. F. Miller, W. E. Tomson, J. F. Wilson; 10:15-11, "Proposed Tuberculosis Legislation," J. P. Iverson; 11:15-12, "Some Conclusions Drawn from Tuberculin Testing under the Pure Milk Law," J. G. Jackley. 1:30-2:30, "Cooperative Tuberculosis Eradication in Nevada," Edward Records and N. E. Nielson; 2:45-3:45, "Complications Associated with Infectious Abortion," L. R. Vawter and Stephen Lockett; 4, some results in the treatment of sterility (with demonstration of technique employed), J. A. Woodside. 7:30, "Tuberculins," M. Dorset.

ITALIAN VINEYARD BERKSHIRES

The Italian Vineyard Company at Guasti has established one of the largest and best Berkshire herds in the entire country. If the term "big type" can be applied to the Berkshire hog at all these are the "big type" Berks. These sows are big boned, high backed and deep sided and of excellent conformation.

The Laurel Champion and Grand Leader 2nd blood lines have been chosen as the ones to accentuate and most of the herd is rich in the blood of these great herd boars.

Winona Leader Champion, a son of Laurel Champion and a litter mate to Laurel Champion's Best, shares the leadership of the herd with Rincon Leader, a mighty fine sow of Grand Leader 2nd.

Alex M. Wilson, the superintendent, has picked out 30 of these fine sows and gilts and bred them to the great herd boars for his sale which will be held at the Italian Vineyard at Guasti, which is three miles east of Ontario, on February 1.

It will be the Vineyard's first sale and a mighty attractive offering is promised.

NEW SHORTHORN ENTRY RULES

The American Shorthorn Breeders Association announces that the pedigree of no animal over two years of age will be accepted for registry in the American Shorthorn Herd Book after February 1, 1921, or in the case of animals imported from Great Britain or Canada, two years after date of importation. After January 1, 1921, a fee of $5 will be charged for entering the pedigree of an animal between one and two years of age. The fee formerly was $10. The seller of an animal must furnish transfer and pay the transfer fee after January 1, 1921. The pedigrees of twin animals must be entered for registry at the same time.

HOG AUCTION DATES

Hog auction sale dates for January are announced by the farm bureau marketing association: Modesto, 4; Tegner, 5; Chowchilla, 6; Fresno, 7; Wasco, 8; Tulare, 11; Visalia, 12; Hanford, 13; Corcoran, 14; Bakersfield, 15; Turlock, 18; Merced, 19; Madera, 20; Fresno, 21; Tulare, 25; Visalia, 26; Hanford, 27; McFarland, 28.

COST OF RAISING DAIRY HEIFERS

The importance of providing cheap feed for growing heifers and practicing thorough culling is brought out by the results of feeding experiments recently completed. In these experiments groups of calves were fed from birth to one year and two years of age and a record kept of all feed consumed.

In one experiment, 11 heifer calves were raised to the age of one year. The amount of feed consumed by each calf was as follows: Hay, 571.8 pounds; grain, 885.5 pounds; silage, 3,693.1 pounds; milk, 110 pounds; skim milk, 2,414 pounds. Estimating the hay at $30 per ton, grain at $60, and silage at $8 per ton, milk at four cents and skim milk at three-fourths cent per pound, the cost of raising each heifer to one year of age was $72.42.

Five of the calves from the first experiment were then fed for one more year. During this second year each calf consumed on the average 1,117.8 pounds of hay, 1,221.6 pounds of grain, 8,031 pounds of silage. Using the same figures for computing the cost of the feeds consumed during this second year, the total cost of raising a heifer from birth until two years of age was $157.96. These figures emphasize the necessity of providing cheap feed for heifers such as pasture and silage, and bring out the importance of carefully culling the heifers to avoid raising those which will prove to be inferior cows.

THE BEST LINIMENT
ON PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For — It is penetrating, soothing and healing, and the for all Old Sores, Bruises, or Human Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has Body no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

POSTPONED SALE
—OF—
POLAND CHINA HOGS
At Orland, Cal., Wed. Jan. 5th, 1921

On account of weather conditions, I have postponed my sale until January 5th, at which time I will offer 60 head, including 30 spring gilts, 10 fall yearlings, 10 tried sows and a few young boars sired by Long Jumbo, Yates Big Orphan, Glenn Chief, Young Hadley and bred to Yates Big Jones, Y. C. 4, Reformer and Black Bob. Write for catalog.

R. J. Yates Orland, Cal.

King's Big Bone Leader

A Grand Champion and the sire of a Grand Champion heads my herd of high class sows. He has sired a high class of pigs. I will sell 35 head of selected sows at public auction in January. Write for prices and information.

Les McCracken Ripon, Cal.

Trewhitt's Big Type Polands

Are the result of careful mating and selection. Size and feeding quality have always been essential features in this herd. Write for prices and information. I can interest you.

W. D. Trewhitt Hanford, Cal.

Eastman Ranch Poland Chinas

Herd headed by Buster Bob, Grand Champion at the strong Los Angeles Live Stock Show. He is the largest junior yearling in the state and is siring some great pigs. Young stock for sale at all times. Satisfaction assured.

H. L. Graham, Mgr. San Fernando, Cal.

Victory Bob, the Greatest Son

of the grand champion Giant Bob heads the Sunland herd of big type Poland Chinas. Some choice young animals of select breeding for sale at all times.

H. A. Johansen Fresno, Cal.

Fortuna Herd Poland Chinas

Special prices on gilts sired by The Californian, either open or bred to The Skipper by The Pilot. Two sisters to Orange Lady, first prize senior gilt at Sacramento. Also some choice weanling boar pigs. Satisfaction assured.

Hugh C. Shinn Tulare, Cal.

Get Into the Hog Business

By Jack Klein

"If I wasn't already in the business, right now is the time I would buy a lot of hogs," said a big breeder the other day. He is one of these men who follow the idea of the Missouri farmer who refuses to sell a bushel of corn but feeds every ear he raises to some kind of livestock. Backing up his faith in hogs as the best means of getting a good price for the grain he has on hand this man has just purchased a lot of feeders.

Instead of worrying about the low grain market, get a few hogs and feed up your surplus. There is every indication that next year will be another banner year for grain and the market will continue slow and low.

If you examine the hog market carefully you will see that porkers are paying a good return even though the price is apparently low.

During the past period of high prices many sows went to market—happily most of these were grades or the indifferent variety of pure breds. For that thing let everyone give thanks.

It has been proven so many times that pure breds of the right type are the only hogs which will make pork profitable that the matter is beyond the point of argument.

The breeders of good hogs who have stayed in business during the period of high priced feed are to be commended and everyone should pitch in now and help them by buying some of their animals. At the prices which prevail you may not help them greatly but you will surely help yourselves. There will be a number of sales in the next few months and you will have a chance to pick from the tops of the big herds of the state for the breeders have kept nothing but their best for breeding purposes.

For the man who raises a lot of grain there is no better solution of the marketing problem.

Removing Hides and Skins

A number of people engaged in the business of slaughtering food animals reduce their profits by careless methods.

When we take in consideration the present prices of various leather commodities, on first thought we begin to figure the enormous profit the leather producer makes on the country hide we sell him. A little further investigation of the factors required to constitute a good hide discloses that the methods of removal and care of the hide were responsible in a large measure for what was regarded as an unsatisfactory price for the commodity.

The packinghouse quotations on hides are rather confusing to the ordinary country butcher. When he examines the quotations he may be inclined to feel that the hide buyer was a little unfair in his dealings. A little further knowledge on the subject of hide quality may considerably reduce his suspicions regarding the methods practiced by the purchaser of the hide.

The packer hides and skins are removed from carcasses by men skilled in the art of their removal by standard methods which, barring an occasional accident, bring top notch prices on the hide market. The price of the country hide is established by the quality of hide produced by the packer, and it remains for the country butcher to become familiar with certain defects in a hide or skin, produced by skinning, which reduce its worth, and then avoid such defects in the future.

The state department of argiculture offers the following remedies for the prevention of defects in removing hides or skins:

Instead of skinning out the head in one piece, cut across at the base of the horns and then down the left side of the face close to the eye and through the left nostril. Cheek meat should not be left on the hide or skin.

When skinning the legs first cut off the dewclaws, make a transverse incision at the heel, then rip in a straight line along the back of the leg to what is known as the knee and skin out the leg on either side of the incision.

From the ripping open cut down the belly, start well forward at the brisket and make a slanting cut back to the knuckle joint of the fore limb and skin carefully from the incision. Then again, from the ripping open cut down the belly between the root of the tail and the bag (preferably nearer the latter), but up along the hind leg to the point of the hock (sometimes termed the knee), and skin around the leg from the incision.

Removing the hide from the butt and rump requires extreme care if scoring is to be avoided. In these regions the knife is used sparingly and the hide should be pulled taut when it is used. Pulling and beating the hide as much as possible prevents scores.

When skinning along the belly and side of the carcass make long, sweeping strokes with a sharp knife by pulling the hide firmly up against the cutting edge held where the hide and flesh join. Bad scores on the neck and shoulders will not result if a sharp knife is used and the hide is pulled up against its edge and at the same time large sweeps are made instead of short blind cuts.

Rip down the under side of the tail to the tip and remove all the bone.

When the hide or skin is removed, spread it on the floor and slit each ear lengthwise so that all parts will lie flat while being cured.—J. P. I.

KEEP MILK RECORDS

Any farmer who is making a specialty of milk production and wishes to carry on his work in a businesslike way will keep milk records, individual performance records for each cow in the herd.

Here are nine good reasons for keeping milk records, as stated by the Louisiana state university:

"They enable the dairyman to feed each cow according to the quantity of milk she produces.

"They form the only basis on which a dairy cow can be improved. The time is here when no dairyman practicing business methods will buy a herd bull whose dam does not have an authentic record showing creditable milk and butterfat production.

"Records alone will sell cows when no other quality will. Grade cows with records can be sold for 25 to 50 per cent more than those without records.

"A system of records is the first step in building up a herd. The unprofitable cows are the most expensive. Their heifer calves are usually non-producers.

"Records stimulate better feeding and breeding. The dairyman who keeps records usually keeps a balanced ration and becomes interested in winter dairying, which has numerous advantages over breeding cows to freshen in the spring.

"The weighing of the feed and milk keeps the owner in close touch with the daily condition of each cow.

"Records stimulate better milking. Milk scales serve as a check on the milker and induce him to milk the cows more thoroughly than when the milk is not weighed.

"A knowledge of what each animal is doing develops personal pride and interest in the herd.

"Finally, records make dairying a business proposition."

SUPERPOWER SURVEYS

A program for completing the topographic map of the United States for the use of this generation was outlined in last year's report of the director of the United States geological survey, but congress has not yet approved that plan, though it promises to get results most expeditiously and economically. The power program, also presented in the report for last year, has found more encouraging support, as the superpower survey of the Eastern industrial zone has been authorized by congress and is now under way. It is hoped that the engineering report on this survey will commend itself so highly to congress that similar investigations of other parts of the United States may be authorized before the demand for unified electrificiation becomes so urgent as it has already become along the North American seaboard.

Condition of stock on the Arizona ranges is fairly good, although cold weather and some snow storms have caused some shrinkage. Snow and rainfall so far have been light in a large part of the range country.

Hartsook Secures Interest in Wonderful Bull

The outstanding deal in California Holstein circles was recently consummated when Fred Hartsook, Lankershim, purchased from A. W. Morris & Sons Corporation, Woodland, a half interest in the sensational bull calf, Prince Aaggie Mead. The price paid has not been made public, but is known to be greater for the half interest than the total purchase price of any bull previously sold in California. The Morris firm prized the calf so highly that they declined to sell him outright, and several other breeders who had been figuring on securing an interest in him will no doubt be disappointed when they receive the news of the sale.

Prince Aaggie Mead represents some of the very richest breeding in the Morris herd. He is sired by King Aaggie Mead, he by King Mead of Riverside and out of Aaggie Acme of Riverside, who made 1,054.1 pounds butter in one year at 11½ years of age, and is therefore a full brother to Aaggie Acme of Riverside 2d, whose record of 1,331.7 pounds butter in one year is the world's strictly official record, and she is the dam of Miss Aaggie Acme Burke, who made 1,034 pounds butter from 24,690 pounds milk in one year as a first calf junior two year old, her milk record a world's record for age, and she in turn the dam of King Korndyke Pontiac Acme, the bull for which Anita M. Baldwin paid $41,000 in the St. Paul National Sale.

The dam of Prince Aaggie Mead is the famous Miss Valley Mead De Kol Walker, who broke three world's records as a heifer, won the California Dairy Cow Competition over all ages and breeds, and made 36.81 pounds butter in seven days and 1,113.58 pounds in 339 days as a junior three year old. She is by Prince Gelsche Walker and out of De Kol of Valley Mead 2d, who made 906.27 pounds butter in one year as a three year old and 1,011.71 pounds butter in one year as a four year old, which was a world's record for two years production at age when made.

Thus, Prince Aaggie Mead descends from the great foundation cow, De Kol of Valley Mead, through her greatest proven son on the sire's side, and through her greatest producing daughter and granddaughter on the dam's side. He is out of the same dam as the $12,000 Burr Farm bull, King Korndyke Pontiac 20th, who sired the $41,000 bull, King Pontiac Acme, owned by Anita M. Baldwin. Another son of Miss Valley Mead De Kol Walker, Sir Aaggie De Kol Mead, who is sired by Sir Aaggie De Kol Acme, is now in active service in the Morris herd.

The purchase of a half interest in this great youngster looks like a ten strike for Mr. Hartsook. He has assembled a very high class herd of registered females, and through this bull will link his herd up with some of the most popular high record breeding in the West, a line of breeding that has already been adopted by a large number of the most progressive breeders in the West.

Sacramento Holsteins Make Fair Average

Considering the fact that the Holstein cattle offered in the consignment sale held at the state fair grounds, Sacramento, December 16, were sold without any guarantee save that they were breeders, that many were young things and not a few were sold with defective udders, the average price of $207 was regarded as a fair valuation. It was admitted by all that there were a number of real bargains sent through the ring, and it is certain that if the better things could have had the backing of a tuberculin test that the average would have been much higher. The sale demonstrated that California buyers are becoming more and more critical in their selections. First of all, they want clean cattle, and, second, they want high production and are willing to pay a fair price for both.

The top of the sale was reached with the attractive four year old daughter of Prince Gelsche Walker Korndyke, May Walker Gelsche Korndyke, with 27.84 pounds of butter to her credit in seven days, that was consigned by the Bridgford Holstein Company, Patterson, and purchased by Earl Graham of Compton for $1,250. R. N. Clapp was the runner up. The Bridgford Company had the high average of the sale, registering $590 on the four head they contributed.

R. F. Fisher of Carlotta, who dispersed his entire herd in this sale, furnished the second high animal in the outstanding Sequoia Sugra Queen Hengerveld, that has 650.87 pounds of butter in 298 days and is a daughter of Sugar Queen Topsy with a 365 day production of 1,038.63 pounds of butter. She was secured by William Dreher of Sacramento, who also got her dam for the disappointing price of $575.

The sale, which was under the management of the California Breeders Sales and Pedigree Company, Sacramento, served to attract a number of new Holstein buyers, who doubtless will become factors for good in their local communities. Col. Ben A. Rhoades of Los Angeles was on the block and Col. John A. Davis of Manteca assisted at the ringside.

A list of representative sales follows:

Consigned by R. F. Fisher, Carlotta

1. Sugar Queen Topsy, 1038.63 lbs., 365 days, William Dreher, Sacramento, $575.
2. Sequoia Sugar Queen Hengerveld, 650.87 lbs., 240 days, William Dreher, $1,025.
6. Sequoia Pontiac Cris, Dec. 1917, 225.5 lbs., 150 days, William Dreher, $300.
7. Sequoia Pontiac Carlotta, Nov. 1918, R. E. Mills, Lodi, $150.
9. Amy Veedam Pontiac, Sept. 1913, 764,186 lbs., 305 days, R Zangl, Bellflower, $285.

31. Creamcup Lassie Ignaro, Feb. 1916, 12.05 lbs. 7 days, H. E. Frost, Elmira, $225.
33. Gelshe Nellie De Kol, Jan. 1916, 15.6 lbs. 7 days, A. R. Strother, Acampo, $155.
36. Olive Beets Segis, Feb. 1915, 18.42 lbs. 7 days, H. E. Frost, $225.
41. Flossie Johanna Sadie Vale, March 1917, R. E. Mills, $155.
42. Stanislaus Abbekerk Maid, May 1913, 25.77 lbs. 7 days, J. G. Smith, $240.
43. Juliana Zozo, May 1916, R. Zangl, $225.

Consigned by Bridgford Holstein Company, Patterson

47. Piebe Laura Ormsby, May 1913, 32.78 lbs. 7 days, J. W. Scudder, Escalon, $550.
48. Briar Aaggie Jewel Rag Apple, May 1916, 23.14 lbs., A. R. Strother, $210.
49. May Walker Gelsche Korndyke, March 1916, 27.84 lbs., Earl Graham, Compton, $1,250.
50. Alcartra Sadie Vale Abbekerk, April 1918, A. W. Morris & Sons, Woodland, $350.

Consigned by J. McKindley, Acampo

59. Cobossie Korndyke, Aug. 1914, 19.29 lbs., G. H. Colby, Clarksburg, $275.
63. Wilhelmina De Kol of Nevada, Jan. 1913, 20.69 lbs., D. W. Blower, $190.
65. Prince Gelsche Pondyke Walker, June 1918, R. Zangl, $150.
66. Eva Korndykek Loraine, March 1920, A. W. Morris & Sons, Woodland, $150.

Consigned by Toyon Farms Association, San Francisco

67. Daisy Pride Colantha 4th, Nov. 1911, R. Zangl, $205.
68. Pearl Astrea 2d, April 1909, R. Zangl, $150.
69. Oakdale Lady Wit Cornucopia, Dec. 1916, D. W. Blower, $265.
70. Kakenstein Gerben, Sept. 1911, 25.19 lbs., G. H. Colby, $300.
71. Lady Pietertje Melva 2d, Feb. 1917, R. E. Mills, $170.
72. Toyon Colantha Fayne Valdessa, R. Zangl, $205.
73. Cascade Ruth 2d, Nov. 1915, 415.37 lbs. 145 days, R. Zangl, $325.
76. Cascade Ayacnora, Jan. 1915, J. W. Scudder, $300.

Consigned by E. D. Barry, Jr., Daggett

77. Princess Contenta Walker, Jan. 1917, 17.70 lbs. 7 days, A. W. Morris & Sons, $700.

Good Herefords to California

William G. Briggs & Son, Dixon, and John A. Bunting, Mission San Jose, recently bought eight head of well bred and very promising young Herefords from four Missouri breeders. The Californians arrived in Kansas City about two weeks prior to the American Royal show and spent the time visiting and inspecting many of the Hereford herds in the Kansas City territory. They made their purchases while on this tour and were interested guests of the Royal before returning to California.

Briggs & Son bought one bull and five females, six head in all, while Mr. Bunting's purchases consisted of two young bulls. A list of the animals purchased follows, with a description of their breeding, ages and other information of interest.

Briggs & Son's purchases were: Belle Blanchard 83d, by Beau Blanchard 53d, dam Belle Blanchard 34th, by Beau Blanchard; calved January 9, 1919. Purchased from Jesse Engle & Sons, Sheridan, Missouri. This is a double granddaughter of Beau Blanchard that stood well up in the large classes at the various state fairs this fall.

Bonnie Dorana, by Bonnie Lad 20th, dam Gondola 5th, by Beau Modest; calved November 1, 1918. Purchased from Walter L. Yost, Lees Summit, Missouri. Bonnie Dorana is a show heifer of beautiful type that won the female junior and grand championship at the Missouri state fair and was first in her class in most of the eight state fairs in which she was exhibited.

Bonnie Valentine, by Bonnie Lad 20th, dam, Josephine; calved November 14, 1918. This is another choice daughter of Bonnie Lad 20th that has made a good record in the 1920 shows. She also was purchased from Walter L. Yost.

Beau Prince 33d, by Prince Donald 526154, dam, Vernet Princess 33d, by Point Comfort 14th; calved January 3, 1920. Purchased from O. G. Lee, Kansas City, Missouri. This is an outstanding herd header prospect that won first prize in the class of 22 junior bull calves at the American Royal Show and headed the fourth prize calf herd class of 20 entries in the same show. Misses Donald 33rd and 44th, mentioned below, are his half-sisters and completed the calf herd group.

Miss Donald 33d, by Prince Donald, dam, Miss Gay Lad 55th; calved December 11, 1919. Bought from O. G. Lee. This senior heifer, though of very short age, stood seventh in her class of 42 entries in the Royal Show.

Miss Donald 44th, by Prince Donald, dam, Miss Repeater 19th; calved June 11, 1919. Bought from O. G. Lee. She stood fifth in her class of 38 junior yearling heifers at the Royal and, like her half-sister, was very short aged.

Mr. Bunting's purchases were:

Golden Gate, by Blanchard by Beau Blanchard, dam, a Gudgell & Simpson bred cow; calved June 8, 1920. Purchased from Chas. D. Davis, Grandview, Missouri. This is an outstanding calf. He is an unusual herd bull prospect. Mr. Bunting selected an appropriate name for this calf that he believes is destined to make Hereford history in the Golden Gate state.

The Pier, by Beau Blanchard, dam, Miss Disturber 11th; calved June 5, 1919. Purchased from Jesse Engle & Sons, Sheridan, Missouri. This bull's name was formerly Disturber's Lad, but Mr. Bunting renamed him with a more appropriate cognomen that is more in keeping with his new home.

William Briggs & Son and John A. Bunting are among the leading Hereford spirits in the Pacific Coast country. The former firm started in the Hereford business only a little over a year ago, but has assembled an unusually good herd of well bred animals of outstanding merit and is well on the road to a successful career as a Hereford breeding firm, while the latter maintains a splendid herd on his Mission Hereford Farms. He has strengthened his herd from time to time by the judicious purchase of strongly bred bulls. He has been the secretary of the California Hereford Breeders Association for several years. These men are to be congratulated on the acquisition of such splendid additions to their herds, which we are certain will assist in the development of a bigger and better Hereford business in the Pacific Coast states.—The American Hereford Journal.

WHEN MILKING IS UNPOPULAR

It is not likely that everybody has experienced the disturbed peace of mind produced when attempting to get milk from the udder of a cow commonly known as a "tough milker." Those who have will, no doubt, agree that some of the Ten Commandments were in danger of being broken during the said milking operation. The California department of agriculture, therefore offers the following suggestions with the hope of making milking more popular:

An examination of the cow's teat reveals that it is conical in shape, the base beginning at the udder, gradually tapering until at the end it nearly comes to a point. The tissue of this organ is rather dense, containing considerable elastic tissue. Running through the center of the organ is a more or less extensive cavity which is found to be larger at the base and is known as the milk cistern. The lumen in the teat gradually becomes smaller until near the end it becomes a rather narrow canal. Through this cavity milk is removed from the udder by the sucking calf or the milker.

Several kinds of obstructions may interfere with the free flow of milk during the process of milking.

The mucous membrane lining of the teat cavity may form a fold at some point and act as a valve, thus preventing the milk from flowing freely under ordinary manipulation.

During the course of certain udder diseases clots or curds may form and obstruct the exit of the fluid.

Quite commonly an obstruction is formed by the presence of warts or tumors.

The majority of the cases of teat obstructions which make milking difficult are caused by inflammatory processes induced by injuries near the end of the teat.

The lumen may be unusually narrow or the sphincter muscle (closing band) may be wanting in elasticity.

It is quite evident that relief is dependent upon the determination of the cause of the condition.

Sometimes an inflammatory condition is located at the orifice of the canal. This is usually only of a temporary nature and the use of a sterile milking tube is indicated, especially in cases where inflammatory processes have rendered the end of the teat tender and sore. The tube is gently introduced at each milking, and when in place the corresponding quarter is gently rubbed from above downward, thus forcing out most of the milk. The milk tube, of course, is then removed, thoroughly cleansed, and sterilized.

In case of a permanent constriction of the canal instruments known as teat dilators are used periodically to enlarge the lumen. If the introduction of the dilators does not accomplish the desired results the canal is enlarged with a special cutting instrument known as a teat bistory. Often a very shallow incision suffices to bring about the desired results. Even in cases of the most simple nature the services of a competent veterinarian are recommended if the owner desires extreme precaution against accidental infection which may ruin a good udder.

When the obstruction, from whatever cause, cannot be removed, the udder is not apt to be completely emptied at each milking, thereby impairing its productiveness.

Frequently dairy laborers do not seem to regard milking through normal teats an enjoyable pastime, consequently it devolves upon the owner to require that the udder of "the tough milker" be emptied at each milking in order to prevent impaired function of the organ.—S. O'T.

UNITED STATES
CREAM SEPARATOR
WITH PERFECTED DISC BOWL
World's Record Skimming
Interchangeable Discs
Easy bowl to clean
Crank or Power on either side
One Piece Frame
Ask the Women
—Ask them what special features they consider first when choosing a cream separator. Nine out of ten will say "easy cleaning."
Just so. They know what it means to scrub and clean and assemble — twice a day. The United States Cream Separator has made the clean-up a matter of moments by giving you the first perfected bowl with INTERCHANGEABLE discs. With no set order of disc arrangement to bother with, washing and rinsing is made quick and easy.
AND—the precise fit and smooth action that makes possible the interchangeable discs is also the secret of United States easy running.
You'll thank yourself twice a day if you choose a United States Separator.

NEVADA HEREFORD RANCH

We always carry a large herd of high-class Herefords and at the present time we are offering:

A splendid lot of young cows with Harris Standard 2nd calves at foot, and many of them rebred.

A nice selection of young cows and heifers bred to our herd bulls.

A choice collection of open heifers.

A lot of good rugged range bulls. These are the real money making kind, and they are priced to make money for the buyers. We will sell them in car lots or in lots to suit buyers.

We also have some choice young bulls of herd-header caliber that we will sell well worth the money.

We invite your inspection.

John H. Cazier & Sons Co.

Otis Cordell, Herdsman — Wells, Nevada

Our ranch is on the main line of both the S. P. and W. P. railroads and only a twenty minutes drive from Wells.

Sierra Vista Herefords

One of the largest herds in the West. Built on a Repeater and Fairfax foundation. At present we have to offer 24 choice yearling bulls ready for service.

Sierra Vista Vineyard Co.

Minturn — Madera County — Cal.

On Highway 16 Miles South of Merced

Buy These Shorthorn Bulls

I have for sale at moderate prices 20 well bred, heavy boned red and roan Shorthorn bulls, from 13 to 24 months old, that are just right for top range bulls. Several are Scotch. Also a few yearling heifers. Come and see these bulls, or write for prices.

H. W. Vaughn — Dixon, Cal.

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

Duroc Hogs and Shropshire Sheep. Pure bred stock for sale at all times. J. J. Prendergast, Redlands.

WANTED

Should be glad to hear from party owning small fruit and chicken ranch who would be willing to rent on shares to reliable party. Address: E. L. Cook, Eureka, California.

Wanted To Hear from owner of good ranch for sale. State cash price, full description. D. F. Bush, Minneapolis, Minnesota.

Wanted — Mission Grapes, Grafted Walnuts, Grafted Loguats, Mammoth Thornless Blackberries, apricot, peach and plum trees. Mission Oak Nursery, Santa Barbara, California.

Wanted—Walnut Meats. Fred L. Mitchell & Son, 214 French Street, Santa Ana, Phone 551-M.

FOR RENT
IMPROVED
LAND

For Rent, all or part of 2,000 acres IMPROVED LAND, near Pixley, Tulare County, with water, electric power, buildings, etc., in tracts of from 80 acres upward. Either cash or share rental. Suitable for grains, alfalfa, cotton, grapes, fruits, etc. About half of this land is ready for seeding. Ideal stock or hog ranch.

Apply to H. G. Coffee, Pixley, Cal., or R. Schiffmann, Chamber of Commerce Building, Pasadena, Cal.

During the past ten years Riverside County has gained 42.7 per cent in its irrigated area.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Oil Lease

Upon lease for oil development is a clause proper wherein the lessee is required to begin drilling within a stated time.—Subscriber, Ontario.

Such matters are entirely within the discretion of the parties making the contract. Such clause as that spoken of is quite the usual thing in cases where it is believed that oil is almost certain of development. In other cases where it is what is known as "absolute wild cat territory," such clauses are seldom found, but it is a matter of ordinary bargain between the land owner and the lessee.

Contract of Employment

Some years ago a party came to my ranch and desired to help me for the privilege of making his home with me temporarily. We agreed that he should have the opportunity to develop mineral on the land and I would furnish him with food and lodging. He soon gave up the mineral hunt and has stayed for several years. There has never been anything but a verbal understanding and relations have become somewhat strained. Would it be possible for this party to claim wages for his employment?—Subscriber, Palmdale.

The statute of limitations would undoubtedly run on any wages for a period prior to two years from the date of filing action. The matter of the contract of employment in this case would be entirely one of proof and it would be the word of one party against the other. An agreement such as that made by you is, to say the least, unusual, the usual thing being that the laborer is worthy of his hire. It would be well for you to have the matter reduced to a written contract or at least have the evidence of some disinterested parties as to the nature of the contract. As it remains, it is entirely a case of which party would be believed.

Renewing Note

I made a loan on first mortgage in 1915. In 1918 this loan was extended for two years. It is now again due. Should I allow the mortgage to run any longer?—Subscriber, Willowbrook.

The statute of limitations would not bar action upon the note secured by a mortgage until four years from the date of its maturity. The note being past due, the mortgagor would have the right to come in and pay it up at any time or the mortgagee has the right to commence to foreclose at any time. It is usually considered that it is better to renew such an obligation for a definite period of time by the giving of a new note or a new note and mortgage.

Riparian Right

Can a party whose lands border upon a stream take water out of the stream to irrigate his land, regardless of ditch rights that have been established below him?—Subscriber, Kaweah.

Under the established law of riparian rights a title by prescription cannot be acquired against a tract of riparian land by diverting water from a stream at a point below such land and not interfering with the stream at the riparian land for the reason that the lower appropriator invades no right of the upper riparian appropriator. The latter has no right to prevent such use for he is in no wise injured. However, it has been held that where the water taken by the lower appropriator is diverted to a public use, such as supplying of farm neighborhoods with water for irrigation and towns with water for domestic use and the riparian owner during the period of this diversion for public use has knowingly stood by while the diversion was being made and has seen this water so supplied in quantities inconsistent with use of the water in the stream on his own land, he is thereafter debarred from asserting his riparian rights to the use of this water, to the extent which would conflict with the public rights theretofore acquired. Under that section of the rule restraining the rights of the riparian owner, it must, however, be a public use, and it would seem that the rule would not apply in the case where it is a mere private use.

Pipe Line from Cistern

In a deed made in 1892 conveying to me my home ranch, which has been duly recorded, there is the following reservation: "Reserving to the grantor the right to maintain and use a cistern as now constructed upon the northwest corner of the above described premises." The grantor has been dead about ten years. His heirs are using the cistern for domestic purposes, conveying the water therefrom across from the place in a small iron pipe. There is nothing of record giving any right of way for this pipe. What are the rights as to this cistern and pipe line? Does the right of the grantor run forever, or did it cease on his death?—Subscriber, Duarte.

It might be an interesting question as to whether the reservation was one which was personal to the grantor or constituted a covenant or reservation running with the land, but it is hardly of importance at this time. The pipe has been connected with the cistern and used by the grantor's heirs for a period long past that necessary to give them a right by prescription. All of the elements of the title to an easement by prescription exist. They claim under color of title, to-wit, the reservation in the deed. Their possession has been lawful and peaceable and in good faith. It has been a right exclusive and hostile to the right of the owner of the land. It has, therefore, very probably ripened into a right, which has become an appurtenance to the land upon which the heirs reside, and your lands are doubtless subject to the easement of taking water from the cistern by means of this iron pipe for domestic purposes, which would involve a right to repair such iron pipe and maintain the cistern and give adequate ingress and egress for such purposes.

Line Fence

I have two miles of line where there are six different parties owning land adjoining me. All are non-residents who do not wish to fence. Can I build a line fence and compel the neighbors to pay me one-half of what the fence is worth at the time they wish to join it? Can they make an enclosure by setting their fence post close to my fence and still not connecting therewith? Can I move the fence if I wish to do so, if no one joins it, and can I move any part that belongs entirely to me and my adjoining neighbor has not joined it?—Subscriber, Arbuckle.

The rule in respect to fences is very clearly set forth that co-terminus owners are mutually bound equally to maintain the boundaries and monuments between them and the fences between them, unless one of them wishes to let his land lie without fencing, in which case, if he afterwards encloses it, he must refund to the other a just proportion of the value at that time of any division fence made by the latter. You would, therefore, be entitled to build your line fence and compel your neighbor to pay one-half the value thereof, not when he wisnes to join it, but when he afterwards encloses his land, whether he wishes to join it or not. It is not a question of his connecting his fence with your fence, but a question of whether or not he fences his land. He would not be able to avoid his obligation to you by any such subterfuge as by putting his fence near to but not joining the fence which you have made. Until the neighbor has fenced his land and paid to you one-half of the value of the fence which you have built, it is entirely optional with you whether you shall maintain the fence or remove it, as he has gained no rights in the fence which you have built. You have the same right in this respect as you have in any other construction on your property.

Rebuilding Line Fence

My neighbor and I are in need of a new line fence. Am I required to pay an equal share of the cost of construction? I have no stock and never ex-

Roast Goose for Christmas

By Jean A. Koethen

TENDER and juicy, with that "gamey" flavor so highly prized by epicures, bigger than the average turkey and far more easily raised, roast goose is a dish for any Christmas dinner table. It cannot be raised everywhere, for the goose is a bird that does best on green range, and is not altogether an agreeable companion in a crowded neighborhood, but on the farm or in the suburbs, where its voice does not disturb the neighbors, it is worth while from every point of view.

For one thing, a goose lives forever, or at least a hundred years or so, if it does not come to an untimely end. One need not raise new breeding stock every year or so, as with other birds. William Rankin tells of a goose owned in Boxford, Massachusetts, which was the property of one family for 101 years and was then killed by the kick of a horse. It was not uncommon in former times for the farmer's daughter on her wedding day to receive a goose from the old homestead. Sometimes these geese were kept far beyond the life of the bride to whom they were presented. Good geese may easily be kept for 25 years as breeders, but ganders are generally preferred not over eight years of age. Few geese live to this venerable old age, for the simple reason that they become so domineering in time that they are absolutely impossible. The goose, like the goat, has a mind of its own, and thinks too much to be always a satisfactory pet.

Those who wish to raise a goose for their Christmas dinner in 1921 should be about it before the bells ring in the New Year, for early goslings are best, and the earlier the better. Geese should be mated in the fall so that they may become accustomed to one another before the hatching season begins. Goslings, like ducklings, do not do well in warm, dry weather, and there is much to be gained in getting them out in January or February.

Mating the Breeders

Wild geese mate in pairs, but the domestic geese have been so far domesticated that one gander will mate with two or even three geese. As the ganders grow older, however, they are inclined to neglect all but the favorite, and for this reason it is better to replace them after eight years.

The breeding goose and gander should not be too nearly related, and should be stocky and massive without being fat. They should be clean in plumage, for the dirty looking birds are never the most vigorous. The gander should be from one to three years younger than his mates; more than this if the geese are old.

"A nice meadow, with a brooklet running through," says Theodore Jager, "is an ideal place for them to roam. Not all people have meadows. A field sown to rye the fall previous is the next best place. Provide water in some manner, that the birds may partake whenever inclined. Galvanized iron pails, fastened with four or five sticks to the ground, are sufficient if filled once a day and kept in a shady place. They are not in actual need of water to swim in. If the vegetation is scarce or the drain of producing eggs too much for the birds, feed them once a day with wheat and hulled oats. Do this at night. Use V shaped troughs and keep them at the farthest place in the pasture so that the birds when starting for their quarters may yet have a chance to hunt some choice morsels of grass."

Old barrels make excellent nests, and they should be hidden in out of the way places. Fill the bottom of the nest with dry sand and on top of this place dry straw for the goose to cover her eggs with. If the goose is not to be allowed to sit, the eggs should be removed every day, but a large sized hen's egg should be left in the nest or she will become discouraged.

Three or four goose eggs are as many as a chicken hen can cover. Goose eggs require from 28 to 34 days for hatching, according to breed.

Feeding the Goslings

Goslings grow more rapidly than any other fowl, Emdens often weighing from 12 to 15 pounds at ten weeks of age. If they are to be marketed as green geese it must be at this time.

For the first eight days stale bread crumbs, crumbled fine, are sufficient feed. After the eighth day mix a little bran and corn meal with the bread crumbs, and moisten slightly. The amount of bran and corn meal may be increased gradually and the bread crumbs dropped. As the goslings grow older they will eat more grass and are raised much more cheaply and easily if they have good pasture. If they are to be pushed for market, however, they will have to be fed all the mash they want, with grain morning and evening. The year I raised Emben goslings I found that while they grew with marvelous rapidity they were also marvelous eaters when kept mainly on a grain diet. On this account I doubt if they are profitable when they cannot have pasture. Geese, it is said, will improve any pasture where cows are kept, since they dig out the weeds and keep the grass fine and tender.

Goslings are less susceptible to disease than any other kind of domestic poultry, but they must be kept warm at first and must not be allowed to get wet till their down is replaced by real feathers. They do well when raised in brooders, as well as with chicken hens.

Breeds of Geese

The geese best known in this country are the Emden, the Toulouse, the African and the China. Of these the Embden is most popular, being among geese what the Pekin is among ducks, very hardy, quick growing and a splendid table bird. The Toulouse is a French breed, large, but no heavier than the Embden, which often reaches 25 to 30 pounds, and the flesh is darker. The African is somewhat smaller, but its skin is dark and it is less easily picked than the others. The China or Chinese goose is more ornamental and is said to lay more eggs than the Embden or Toulouse.

SONOMA COUNTY EGG LAYING CONTEST

The Sonoma County farm bureau egg laying contest began in Petaluma the first day of November with 432 hens entered, 36 entries of 12 hens each. The purpose of this contest is to stimulate interest in scientific breeding for egg production, and the land, building and feed have been donated by business men of Petaluma. F. P. Eckland of Hayward has been engaged to manage the contest. The advisory board of the contest is composed of Professor Dougherty, R. B. Eason, extension specialist, and Melvin W. Buster, assistant farm adviser.

The ration used during the contest will consist of 180 pounds each of barley, milo and cracked corn, and a mash mixed according to the following formula: 160 pounds bran, 90 pounds mids, 130 pounds ground corn, 60 pounds ground barley, 50 pounds meat scrap, 50 pounds fish meal, 15 pounds charcoal, 3 pounds salt.

REMOVE HAZARDS FROM HATCHING EGGS

Fertile eggs from vigorous breeding stock are necessary in order to obtain good hatches. Free range for the breeders is most desirable for the production of fertile eggs with vigorous germs, but all eggs produced from such hens should not be used for incubation. Eggs that are abnormally small and poorly shaped or those having thin or very poor shells should be eliminated. Dirty eggs or those badly soiled should not be used. If it is found necessary to set slightly soiled eggs they may be cleaned by rubbing lightly with a damp cloth, care being take not to rub off any more of the natural bloom than is necessary.

It is never advisable to use for hatching eggs that are more than two weeks old. Neither a hen nor an incubator will hatch strong chicks from eggs containing weak germs or from those which have not received proper care.

hen put from three to four inches of damp earth or a piece of grass sod in the bottom of the nest before the nesting material is put in, to provide moisture. When the hen becomes broody, and before she is transferred to the nest for sitting, she should be dusted with insect powder or sodium fluoride. In doing this hold the hen by the feet with the head down, working the powder well into the feathers. This should be repeated about the eighteenth day of incubation so as to be sure that there are no lice present when the chicks are hatched.

The hen should be moved at night from the regular laying nest into the nest where she is to be set. The latter nest should be in some out of the way place where the hen will not be disturbed. In order to make sure that the hen will continue to stay in the new nest, she should be started with one or two china nest eggs. If, at the end of the second day, when the hen should be permitted to leave her nest for food and water, she returns in a short time, the nest eggs may be replaced with the eggs that are to be incubated.

Throughout the period of incubation the eggs and nests should be kept clean. Sometimes it will be necessary to change the nesting material. Eggs should be tested twice during the incubation period, preferably on the seventh and forteenth days, and all infertile eggs and those with dead germs should be removed. When the eggs begin to hatch, the hen should be confined and not disturbed until the hatching is complete. If she becomes restless remove the chicks as they are hatched and keep them in a warm place until the hatch is complete, when all should be returned to the mother hen.

A New Log Saw

Cuts Faster, Costs Less, Makes More Money for Users and Works While You Rest

A new improved power log saw, now being offered, outdoes all other log saws in cutting wood quickly and at little cost. A new 4-cycle, high power motor equipped with Oscillating Magneto—no batteries to fail you—makes the saw bite through logs faster than other log saws. It finishes its cut and is ready for another before the ordinary saw is well started. This log saw—the Ottawa—has a specially designed friction clutch, controlled by a lever, which starts and stops the saw without stopping the engine. Others have imitated, but no other power log saw has this improvement just like the Ottawa. The Ottawa Log Saw sells for less money than any power saw of anything like its size.

Patent Applied For
The Improved Model, 4-H.P. Ottawa Log Saw

One man wheels this outfit from cut to cut and log to log like a barrow. Separate attachments cut down trees and cut up branches. Extra power lets the engine do heavy work of all kinds. Owners of the Ottawa Log Saw laugh at coal shortages and are making big money with ease, the machine doing the work. 35 to 50 cords cut any day, rainy or dry, by one man, are normal figures. And wood is approaching $20 a cord! The Ottawa is compact, simple and durable. It sells for cash or easy payments and is guaranteed. If you have wood to cut the Ottawa Log Saw will be the most satisfactory machine you've ever owned. We suggest that you write the Ottawa Mfg. Co., 2744 Wood St., Ottawa, Kas., for their complete new illustrated book and prices, sent free to all readers of this paper.

UNITED STATES WILL TABULATE FARM EQUIPMENT MANUFACTURE

A census which will show the number and value of different items of farm operating equipment manufactured in the United States during 1920, the number sold in the United States, and the number sold for export, is being undertaken by the United States department of agriculture. Information will be collected from the manufactures of farm implements, vehicles and other equipment.

Since 1916 the department has compiled yearly reports showing the production and sale of tractors, on information supplied by manufacturers to the office of farm equipment control and later to the division of agricultural engineering. In order to meet the continued demand for similar figures regarding other machinery and equipment it has been decided to collect information concerning the manufacture and sale of all the more important items.

The use of improved equipment by farmers in this country is necessary for the welfare of agriculture, and it has had much to do with the prosperity of American farmers as compared to those of other countries. The importance of the farm implement and vehicle industry has long been recognized, but little information regarding its size as compared with other industries has been available. Such figures also will furnish a better basis for estimating the extent to which farmers are using machines and equipment and the amount which they invest annually in equipment for their farms.

The cooperation of the manufacturers, who generally realize the value of such statistics to their industry, has been assured. The division of agricultural engineering of the bureau of public roads will have direct charge of the collection of this information cooperating with National Implement and Vehicle Association. The present plan is to send to each manufacturer of farm equipment a form on which to report by mail the manufacture and sale of different items by his firm during 1920. The department wishes it to be clearly understood that it will follow its usual custom of keeping the reports of the individual manufacturers confidential and that they will be used for no other purpose than that outlined.

MARKET NEWS BY WIRELESS

Arrangements for trying out the wireless as a means of sending out agricultural market news to the farmers of the country are being made by the United States department of agriculture. The trial service will be offered to half a dozen or more counties adjacent to the District of Columbia, going out probably from the wireless station of the federal bureau of standards to numerous private licensed operators who would aid in distributing the reports to farmers and others interested in the territory covered.

Should the experiment prove practicable the service will be extended to other parts of the country. Although no system of dividing the country and of operation has been determined upon as yet, the plan favored at the present time calls for the use of 17 wireless stations throughout the country.

8,000 Miles GUARANTEED Without Punctures or Blowouts

Dayton Airless

They can't puncture—They can't blow out.

No pumping or patching or roadside repairs.

Ford, Maxwell and Chevrolet owners are getting 10,000, 15,000 and 20,000 miles of wear, in all kinds of service—on passenger cars and trucks—under all kinds of driving conditions.

Nothing can happen to Dayton Airless Tires but w-e-a-r. Nothing stops them until they are worn clear down to the last pier of rubber. Remember—without punctures or blow-outs.

Do you use 30 x 3, 30 x 3½, 31 x 4 tires? If you do, spend your money wisely — buy Dayton Airless. It's true economy.

The next time you drive around our way, STOP—AND LOOK THEM OVER.

Wheat: Mixed feed, 33.00.
Barley: 1.52½@1.55.

HAY

Alfalfa Growers of California, report under date of December 29:

The market in Los Angeles is nothing to brag about. We naturally expect a falling off of sales during the holiday season. Last year at this time there were 60 or 70 cars of hay being received in Los Angeles and about the same amount this year, that means about 500 tons of alfalfa a day or 12,000 tons a month. Our average feeding in Southern California is about 5,000 tons per month, so you can see it is difficult for the hay dealer to stand the strain. We have about enough alfalfa in California to feed California dairies and beef producers and my suggestion to the dairymen and beef raisers is buy California alfalfa! Most of the alfalfa in California this winter is in the hands of the farmers who are learning to distribute their product evenly throughout the year and by so doing stabilize prices which means much to the consumer.

There were 750 tons received on the tracks in Los Angeles the week ending December 25, with 200 tons left over as against 870 tons the week before.

Shorts, 33@44.
1.60@1.70.
Middlings, 52@54.

HAY

Alfalfa Growers of California under date of December 29:

The threatened importation of Nevada hay has started and as a consequence our San Francisco qquotations have been knocked sky high. Three weeks ago California alfalfa was selling for $25.00, in San Francisco; today this same hay will only bring $20.00 a ton.

No. 1 dairy 23.00
Standard alfalfa 20.00
Stock alfalfa 17.00

Under date of Dec. 24, A. W. Scott Co. says:

Receipts past week 809 tons. The expected and feared has happened in the hay market. It is apparently now threatened with the flood of shrinkage that is overwhelming all markets of the country. During the past week local receipts have been light and business comparatively normal although dull with the usual holiday dullness. A wave of sentiment, however, has developed all over the surrounding country to let go and turn hay into money at the best price obtainable. As a result several large sales have been reported through the country at prices from $3 to $4 lower than heretofore and hay is offered in the San Francisco and surrounding markets at $4 per ton under our previous quotations.

General belief is that this does not indicate a stampede and a dropping of the bottom out of the market, but nevertheless the downward movement has seriously commenced and its future is only a question of conjecture. In this, the markets of the West are more fortunate so far than through the Eastern states where hay has been recently following the downward rush of all grains and mill feeds.

Alfalfa is extremely dull with a gloomy outlook for the next season as it is reported that hundreds of thousands of acres of land that for the last few seasons have been in use for cotton and other now unprofitable crops is being put into alfalfa. The demand for alfalfa seed this season is simply abnormal and the acreage and tonnage of alfalfa that will come in next year producers fear will be far in excess of any normal demand. Mill feeds and high protein dairy feeds of all kinds continue their downward course and are selling at lower levels.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charge of cartage, commission and handling expenses must be added according to conditions).

Wheat hay, fancy .....21.00@22.00
Wheat hay, light 5 wire bales..19.00@21.00
Tame Oat hay, fair to choice..18.00@21.00
Wild Oat hay.....12.00@15.00
Barley hay .....12.00@15.00
Alfalfa hay .....18.00@21.00

Citrus Markets

Los Angeles, December 29, 1920.

Orange growers are confronted by one serious problem. Box shook and paper are costing enormously and prices do not manifest a disposition to consider those costs. It is now declared that it costs to lay a box in New York at around $2.85 for shook, labor and transportation. Some of the auction markets have shown sales at nearly half this cost. Of course in other markets better returns have been secured especially for regular sizes of high quality stock. Whenever f. o. b. sales have been made it has been around $2.50.

There are not very heavy receipts of foreign lemons but the market is lifeless and there is no money whatever in shipping at the present time.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 1,084 cars; lemons, 637; total, 1,721. To same date last season: Oranges, 3,006; lemons, 537; total, 3,543. From Central California to date this season: Oranges, 3,373; lemons, 28; total, 3,401. To same date last season: Oranges, 2,818; lemons, 107; total, 2,925. From Northern California to date this season: Oranges, 274; lemons, 2; total, 276. To same date last season: Oranges, 237; lemons, 19; total, 256.

BUY POTATO SEED NOW

Time was when potatoes were potatoes and the man who wanted a potato crop simply planted potatoes. But today the California planter is not so easily satisfied. He has come to realize that the potatoes he digs can be no better than the seed he sows. He wants to know what he's planting before it goes into the ground. He now demands a pedigree when he goes out to buy seed. He insists that the seed potatoes he uses must be free from disease and absolutely true to type and variety. He refuses to gamble with unknowns at planting time. He has too much at stake to risk planting anything but the best seed potatoes obtainable.

This changed attitude on the part of potato growers has come largely as a result of the educational work of the state college of agriculture and the missionary work of the state and federal farming experts. The gospel of "Better Seed—Better Potatoes" has been preached and demonstrated far and wide. It is now bearing fruit in an awakened interest in the seed potato industry.

This new interest has naturally brought an unprecedented demand for certified seed potatoes—which demand has never until now been satisfactorily supplied. The organization of the California Seed Potato Growers is the potato man's answer to this question. This new association is composed of the leading potato growers in the state, organized for the purpose of pooling the certified seed potato supply so that the insistent demand for "inspected and passed" seed can be equitably and economically met. No section of the state and no group of planters will now have any monopoly on certified seed potatoes. As long as the supply lasts it is available in any quantity, large or small, to any planter wherever he lives.

Unfortunately the supply of "certified" and "certified, approved grade" seed potatoes is limited. The rigid tests that a seed potato must pass before it is given the state inspector's endorsement are so severe that most potatoes do not survive the inspection. California uses 750,000 bags of seed potatoes a year, only a fraction of which can be certified because of the limited supply. The association has collected them at conveniently located distributing points throughout the state. Many dealers are already stocked. But the word has gone out that owing to the great demand and the limited supply, the man who decides to plant these super-selected seed potatoes must file his order early to avoid disappointment.

The California Seed Potato Growers has the official endorsement and the active cooperation of the state agricultural college and the directors of the state and federal departments of agriculture. The organization is working very closely with Geo. H. Hecke, director of agriculture, and W. V. Shear, state seed potato certification expert. The list of directors includes such names as Hecke, Shear, Gilmore, Rogers, Peters, Lambert, Olsen, McSweeney, Craig, Neilsen and Cohn. J. L. Olsen of Van Nuys is executive secretary-treasurer. The association has just issued an attractive potato growers handbook which answers briefly and accurately every potato question that arises during the year from planting to digging.

LEGAL QUERIES

(Continued from Page 27.)

pect to have any. My neighbor's business is stock raising.—Subscriber, Santa Cruz.

No one can be required to build a fence, but if they do fence in their property they may be required to pay an equal share of the line fence between their property and the neighbor. The rule with respect to trespassing stock is in somewhat inchoate condition, in case of parties who hold land uninclosed. Under the provisions of the estray act, in order to maintain an action for damages for trespass on land it is necessary to show that the land has been adequately enclosed by a substantial fence, but it seems that this rule has been somewhat weakened by a recent court decision.

DUTY OF WATER

The amount of water applied per acre is called the duty of water and is best expressed by stating the number of acre feet of water per acre per year. In many localities, however, the duty is stated as the number of acres per miner's inch or per second foot, or the number of miner's inches per quarter section of land.

Alfalfa requires more water than most other common crops, and alfalfa is the best basis for study and for comparison between different practices inasmuch as it is grown extensively on all varieties of soil and in all altitudes and climates.

The most elaborate duty of water investigations have been made in Idaho and California. In Idaho, Don H. Bark, after investigations covering four seasons and costing $60,000, published many definite conclusions, one of the most interesting of which is that the economic irrigation of alfalfa, in Idaho, on good loam soil, in an irrigation season of a hundred days, requires three acre feet of water per acre. The investigators of the California agricultural experiment station have concluded that in the Sacramento Valley alfalfa should receive from 30 to 36 inches depth of irrigation, the first cutting and sometimes the first two cuttings being obtained before any water is applied. In Arizona the irrigation season is over 200 days in length, and investigations show that there is about as much increase in crop in the application of the seventh or eighth acre foot per acre as in the third or fourth, and the rate of increase is a little over a ton of hay per acre foot applied. One record in the Casa Grande Valley in 1918 showed 22 irrigations of about 5½ inches depth each. The owner claimed that he cut 13 tons per acre, and the county agricultural agent maintained that the record was correct. There seems to be almost no limit to the amount that can be beneficially applied to alfalfa, but excessive amounts cannot be recommended or tolerated because of the rising ground water plane that inevitably results.

With other field crops, however, there is an optimum amount that should be applied, and if a larger amount is used the crop yield is actually reduced. Cotton requires from two acre feet on medium loam soil to three acre feet on light sandy soil and on red desert soil, and milo maize requires even less. Rice, in the Sacramento Valley, requires from four to five acre feet per acre.

In comparing records of the water used in different localities it is found that the duty of water is much higher when the water is delivered and charged for on a measurement basis than when the irrigator pays a fixed price per acre per season. In places where the basis of payment for water has been changed from the flat rate to a definite sum per acre foot, the quantity of water used by farmers has decreased at once. Rotation of water also results in a marked saving over the older practice of continuous flow to each water user, a practice that still obtains in the more northerly irrigated states.

GOOD-WILL

The recent decision of the courts is that good-will is not only a valuable, but a very tangible asset in conducting any business, and that when a manufacturer or dealer creates good-will by a long and expensive campaign of advertising and a competitor endeavors to get the advantage of that good-will by entering the field with an imitation or by using similarity of methods the courts will protect the original dealer in the good-will he has created. This has been made especially clear in the case of the Champion Spark Plug Company. That company sued another manufacturer to restrain it from manufacturing an imitation of the Champion X spark plug and insulator core. It was in restraining the defendant from further manufacturing of those imitation articles that Judge Woodruff gave the ruling that is destined to safeguard business and protect the good-will interests in every line of commercial endeavor.

In his decision, the judge said: "A manufacturer of a useful article is not entitled to have a monopoly of that product and the good-will produced, but neither has a competing manufacturer a right to resort to practices which will result in palming off his goods for those of the original manufacturer or practice any deception which would tend to build a business on the plaintiff's reputation, for this would result in the theft of the good-will established by the plaintiff. The defendant had a right to make a spark plug and sell it as an imitation, but if by means of that imitated product he injures the plaintiff's good-will and profits it becomes unfair competition."

TWENTY-EIGHTH CATALOG

The Aggeler and Musser Seed Company is issuing its catalog for 1921, filled not only with prices and illustrations of seeds and plants they have for sale, but lists of valuable books and magazines on farming, planting calendars, distance tables, hot beds and cold frames, even to "Some reasons why you should be a successful agriculturist." In other words, it's an 112 page book of horticultural information.

Early oranges in Southern California are running to small sizes, owing to a long dry hot spell during summer. Larger or normal sizes will begin to show about January 15.

The K Hand Stump Puller

Gives Your Hand 96,000 Pounds of Power

Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable! you *alone* can pull with my "K" Hand Power Stump Puller--*without digging and without the expense of teams and powder.* We guarantee it. We refer you to U.S. Gov. officials. We give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

K Stump Puller

Frank Hance, a *one-armed* farmer of Bowie, Md., pulling double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K" as the cable can be hitched high and the leverage is consequently greater.

How the "K" Pulls Biggest Stumps

The "K" works on the leverage principle of the ordinary lifting jack, except that the power is applied on a cog-wheel instead of a standard. 100 lbs. push on the truck wheels. Has two speeds-60 feet per minute for hauling in cable for small stumps—slow speed for heavy pulls. *Works equally well on hillsides and marshes where horses cannot work.*

A Mechanical Wonder

Made of finest steel—guaranteed against breakage. Weighs only 171 lbs.—easily carried or hauled about on its own lever develops a 48-ton pull on the stump—per feet per inch steel cable will hold. One or all an man operates it alone—no teams to pay for—no walking.

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder."

Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Brag Saw.

California Produces over Six Million Bushels

THE United States produces about 27 million barrels of apples. Of that ten and a half million are produced on the Pacific Coast. By far the largest apple producing state is Washington with a nearly seven million barrel production. The second state is New York, with California not a very far away third. The six other states producing more than a million barrels are Virginia, Michigan, Missouri, Arkansas, Idaho and Oregon.

It is only a few years since California was producing more than all other Coast states, but the apple planting campaign of a decade ago in the state of Washington carried that state to the top. In fact, almost one-fourth of all apple production is in that state.

California statistics are not clear nor dependable as to apples planted, but a crude guess is that there are "about" 2,316,792 bearing trees, with nearly as many more non-bearing. The value of the crop will vary from five million to ten million dollars.

The principal producing counties of this state in their order are Santa Cruz, Sonoma, Monterey, Los Angeles, Napa, Santa Clara and Humboldt.

One of California's favorite apples for the lower near coast sections is the Pearmain, shown above.

EDITORIALETTES

The War Finance Corporation is to be restored. The Gronna bill was passed by both houses and sent to the president, who immediately vetoed it. The senate, equally as quickly, passed it over his veto, the vote standing 53 to five. Then the house followed suit, practically duplicating the majority given in the senate: "It would exert no beneficial influence on the situation beneficial influence on the situation and would raise false hopes and be hurtful to the natural and orderly processes of business and finance." Senators Gronna and Underwood have been especially active in securing the passage of this bill. It is expected that the activities of the War Finance Corporation will be directed so as to give relief to agricultural centers.

* * *

The emergency tariff measure before congress seems doomed to defeat. Representatives of large manufacturing districts have a fear that if the emergency bill be passed that large trading possibilities will be lost when it comes to the final tariff revision struggle. None deny that the agricultural situation demands relief, but "it is not opportune nor is it wise to create a preferred class" seems to be winning. Senator Penrose is directing the fight against the tariff measure, the partisan Democrats are filibustering and President Wilson has signified his intention of vetoing the measure even if it does pass both houses. The only ray of hope for the farmers seems to be in "Senator Curtis, the Republican whip in the senate, has been in close conference with President-elect Harding." It may be that he will succeed in getting the next president to take a hand in the proceedings in behalf of the farmers.

* * *

The state legislature is now getting down to work. The agricultural legislative committee has been in action for some months and has some very definite concrete suggestions. We sincerely hope the present session will end with a series of better agricultural enactments than have resulted from the labors of any preceding state legislature.

* * *

A bill which has much of agricultural interest is one which would impose a tax of one cent a gallon on gasoline and distillate for "all purposes." It is proposed to collect the tax at the original source of distribution.

* * *

Senator Scott will introduce a bill calling upon the people to decide as to the issuance of an $18,000,000 bond to provide funds for bonuses to be paid to ex-service men, not more than $250 to be paid to any one man.

* * *

Senator Inman's bill provides that dealing in futures in foodstuffs be a misdemeanor. He believes this will reduce the high cost of living.

* * *

Senator Harris will introduce his bill passed by the last legislature and under referendum defeated by the people at the polls November 2. This is the bill providing for funds to be used in the enforcement of Amendment XVIII, National Prohibition.

* * *

It is said that the increased teachers salaries measure will require a total school appropriation of between 85 and 100 million dollars.

* * *

The greatest problem before the state legislature has to do with revising the tax system so as to secure funds to satisfy the enormous appetites of the tax eaters. It will be no child's job.

* * *

At Washington the principal amusement has become cabinet making. A few days ago the very definite announcement was made that Henry Wallace of Des Moines is to be secretary of agriculture. It is rumored that Wallace aided in writing some of President-elect Harding's speeches which were delivered in agricultural sections. Wallace knows American agriculture as but few others. If he is appointed we believe he will maintain the pep and punch which has been put into department activities by Secretary Meredith.

* * *

In the daily press appears: "Governor Stephens today announced the appointment of J. L. Mathews of Covina, Los Angeles County, as a member of the state water commission to succeed W. A. Johnstone of San Dimas, Los Angeles County, resigned." Mr. Johnstone has been a member of the state water commission since its formation and has rendered most loyal service. We regret to see the state lose his abilities. Mr. Mathews is a lifelong newspaper man who is thoroughly in touch with the irrigation needs of the state.

BY PANAMA

Water shipment of oranges to Eastern points has been contemplated almost since the Nicaragua and Panama Canals have been under consideration. Since the recent advance in freight rates new impetus has been given to the movement. The Fruit Growers Exchange announces its first shipment of 2,000 boxes from the port of Los Angeles by S. S. Charles H. Cramp, a 9,000 ton steel liner of the Atlantic Gulf and Pacific Steamship Co. Loading is now in progress and the steamship company guarantees 15 day service to Philadelphia. A department of agriculture refrigeration expert will accompany the shipment.

RAISIN SLATE CLEAN

Los Angeles papers of January 4 state: "Another stipulation covering the future operations of the California Associated Raisin Company, which makes it probable, according to John H. Atwood, special assistant to Attorney General Palmer, that the amended bill of the government charging the concern with violation of the interstate commerce law will never be filed, was signed here yesterday by U. S. District Judge Bledsoe and representatives of the Fresno concern."

This action follows motion interposed by the raisin company regarding the abrogation of the stipulation entered into several months ago. "The defendant company will be permitted to seek new contracts from the raisin growers without being deemed to have violated the terms of said stipulation." The company is to publish in the Fresno Republican not later than January 15 notice stating "Old grower contracts, etc.", and "that a new contract shall be entered into in no wise a renewal of the old contract." "The court shall retain jurisdiction," but it is generally considered that this leaves a clean slate for the raisin growers to proceed and continue cooperation.

HOGS AND DIAMONDS

Sirs: I am writing you a few lines to let you know my disappointment in the Cultivator. You quote J. P. Morgan and you quote the bankers association that if the people would dig up the $20 apiece they (the bankers) would make good times. What a fine thing you are for the bankers! You quote the secretary of California Rice Association: "Buy a bag of rice." Now when I ask for prices on rice I am told 10 or 11 cents, and find the rice grower gets 3 cents. Now, Mr. Editor, who do I help when I buy rice? It's the middleman, the wholesale grocery thieves, the railroad hogs. More than 300 per cent goes to the wolves! And what are you doing? Nothing! It is so on almost everything the farmer produces, big profits for the hogs. You quote some dub: "What's the matter with America?"—"Less diamonds and more alarm clocks. Too little regard for the result of hard work and too little desire to emulate it." Who ever got rich off their own labor? You can't name ten men in the United States that got rich on their own labor. I challenge you to name three. And what are you doing to help the farmer? Next to nothing! Anyone that insinuates that the farmer or laboring man buys any considerable amount of diamonds is either a fool or a liar. Your Cultivator is reactionary.—J. J. F.

First, about the rice: We must call attention to the fact that rice ready for table use bears about the same relation to the rice sold by the grower as does fine wheat flour to the grain sold by the wheat grower, that is, the rice is milled, the hull is removed and usually the bran, it is polished and graded, the brewers rice, which is a product of very slight value, is separated out, as is also the broken rice, and some two or three grades of whole rice. It is then sacked, or often placed in cartons and transported to market, with some two or possibly three profits added. If our subscriber will take into account the shrinkage in weight in the hulls, which are of no value, together with the low priced broken or brewers rice, he will perhaps see that the difference is not so great between what he pays and the grower receives. If our correspondent had taken becon as an example of a terrific spread between consumers and producers prices he would have a more emphatic example and the Cultivator would in no way minimize the lesson which these examples give us.

We note the writer has no royal road to correction of the evil to which he calls attention, and we are all one in this particular, though some of us imagined for a time that there were methods of giving to the producer justice. We believe the nearest we have ever come has been through such organizations as one of which he is a member, known as the Associated Raisin Company. It has succeeded in getting a fair percentage of the consumer's price to the producer. There are other examples. May they continue to increase. They succeed because they become great strong organizations able to command rather than to ask favors of bankers or others.

Our critic says the Cultivator is doing nothing for the farmer. Maybe not, but we are trying "our durndest." As to any insinuation for which we may have been responsible that the farmer is overloading himself with diamonds, we retract unequivocally.

While we are writing this comes another letter from a Turlock subscriber who signs himself D. M. L. and suggests exactly the same procedure we have outlined above, excepting that he names the farm bureau as the organization to accomplish the results, and we hasten to respond to him "Aye, aye, Sir, we are with you!"

Yes, the high cost of living is coming down. As usual the farmer is the goat. A few days ago I went to a grocery to get some provisions. A piece of bacon was listed at 60 cents per pound. At the same time fat hogs are bringing around ten cents and most other articles and necessaries are about the same. I would like to see you boost the farm bureau and the farmers marketing association.

We wish we were able to give the entire address of President Howard which he gave at the Indianapolis meeting of the National Federation of Farm Bureaus. President Howard wielded some sledge hammer blows, but came back to the final conclusion that only through cooperation of the individual members of the organization could protection be given to our producers. This address of President Howard's we have copied from as liberally as possible and if D. M. L. and every hog producer will continue to support the farm bureau marketing organization he will be doing more efficient service to his neighbor and to himself than can the Cultivator through the most efficient preaching it may know how to command.

We grant that real cooperation sometimes calls for sacrifice, and the short sighted may become impatient and cease using that effective weapon and devote his energies to shouting: "Down with the profiteers and transportation hogs!" If there is no avail in crying "Peace, peace when there is no peace," there is none in shouting "War" unless we get in and do some of the fighting on our own sector.

Bud Selection in the Citrus

By A. D. Shamel

THE season for planting citrus trees in California will soon be here. The indications at this time, January, 1921, are that there will be considerable new plantings as well as replanting some established orchards. Inquiries received by the writer indicate that some lemon orchards are likely to be budded over to orange varieties. All of this work involves the relation of selected buds to improved production. In this paper the writer hopes to present some of the reasons why prospective planters should use only reliable trees grown from carefully selected buds and the importance of using selected buds for top-working established trees. There is no single factor of greater importance to the welfare of the orchard than the kind of buds used for propagation. No matter how favorable the location or how rich the soil may be, nor how great the care used in planting and handling the orchard, the best of results to the individual or the industry as a whole cannot be secured without the use of properly selected buds in propagation.

Proof of Quality Is Shown in Fruit
Showing fruit bearing bud wood used for propagation, which is secured from parent trees bearing heavy and regular crops of uniformly good fruits.

It is a well established fact, beyond dispute, that the citrus varieties are made up of a number of strains which have arisen for the most part through the unintentional propagation of bud sports. By means of individual tree performance records the comparative value of these strains has been ascertained under different conditions of culture and environment. It is simply a matter of common sense that only the best strains should be propagated for commercial planting. This purpose can be achieved by securing bud wood from the typical and best individual trees of the valuable strains. Usually, the best trees are the most productive ones and those which bear the most uniform crops of fruits. These facts explain, in part at least, the importance of individual tree performance records as a basis for the selection of the superior parent trees of the best strains as sources of bud wood for propagation.

In the commercial selection of bud wood for propagation only those trees which have produced a high average annual yield are considered. These high yielding trees are then carefully inspected as to type of fruit and uniformity of fruits before any bud wood is cut from them. A sporting branch or any decidedly off-type fruit automatically disqualifies the tree producing such variations from further consideration as to source of bud wood for propagation. The uniformity of fruits and foliage is an indication to the writer of the stability of the inherent characteristics of the individual tree. The occurrence of strikingly variable fruit or foliage is an indication to the writer of the lack of stability of inherent characteristics and the undesirability of the individual tree possessing such sports as a source of bud wood for propagation. A large number of progeny tests have continually confirmed this idea in the mind of the writer. The desirable parent tree is one possessing the characteristics, as shown by its performance record, of heavy and regular production of uniformly good fruits.

Uses of Selected Buds

The propagation of citrus trees in the nursery has been the chief use of selected buds. The top-working of individually undesirable trees in established orchards and the top-working of trees in the orchard as a whole from one variety to another is also an important use of selected buds. The importance of using carefully selected buds is as great in the one case as in the other.

The citrus nursery business is usually conducted by men of experience in growing nursery trees and who specialize in this work. All progressive nurserymen are now agreed as to the necessity for using scientifically selected buds in their business. There is an adequate supply of such buds of all important citrus varieties grown in California available for use and a nurseryman who does not utilize such buds is open to the criticism of propagating inferior stock, and is a serious reflection on the part of any nurseryman neglecting to use up-to-date methods. Ordinary citrus trees grown from guesswork buds are very dear at any price. No intelligent planter or propagator will buy such trees or buds, no matter how cheap their price may be when it becomes generally understood that reliable trees grown from carefully selected buds and reliable bud wood are available. The slight difference in price of ordinary trees or buds and the best trees and buds is usually made up, or more than made up, in the improved production of the reliable trees or buds in their first crop. There are other economic advantages of planting reliable trees and using reliable buds for top-working which will be touched upon in this paper.

Results

The early fruiting of trees grown from buds selected from superior parent trees is now a matter of common knowledge and experience. The writer has many records of the early production of desirable and uniformly good fruits by trees of good parentage, superior in every way to the production of trees grown from ordinary and oftentimes undesirable parentage. In the first place the productive and desirable strains are characteristically early fruiting in their behavior. In the second place the progenies of the superior parent trees produce not only early fruit but fruits of fine commercial characteristics as well. This fact alone is of sufficient importance to the mind of the writer to justify the purchase of trees grown from carefully selected buds and of selected buds for top-working.

The short sturdy growth from carefully selected buds of the desirable strains needs considerably less pruning and care than that from ordinary buds of the undesirable strains. This difference, as demonstrated commercially many times in the recent experience and observation of the writer, is sufficient to oftentimes more than make up the difference in cost of reliable trees and buds as compared with ordinary trees and buds in one season's expense. When it is considered that the pruning expense is a frequent one, usually an annual or semi-annual cost, the importance of this item can easily be brought home to the grower.

The production of uniformly good fruits of first class commercial grade is the foundation of the commercial success of the citrus industry, or any other industry as a matter of fact. The writer maintains and can prove that reliable trees grown from carefully selected buds of the best strains produce more uniformly good fruits of the best commercial grades than do ordinary trees grown without this care. This improved production is important, not only to the individual but also to the industry as a whole. It is the foundation upon which the reputation of the industry is builded. It is the patriotic duty of the grower, as well as the consideration of his own individual interest to plant only reliable trees or use only carefully selected buds for top-working. Nursery trees grown from buds secured from superior parent trees, as well as established trees top-worked with such buds, may not make the rank growth of buds secured from the trees of the Australian navel orange strain or the Shade-tree lemon strain. However, experience has shown that the growth of the selected buds is satisfactory from every standpoint of the growers and is much more desirable than the growth of the buds secured from the undesirable parent trees.

Boxes and Equipment are Arranged for Making Complete Records
Securing individual tree records of production in a Washington Navel orange orchard.

Poor Trees and Buds Result in Wasted Effort

The orchards where the grower has been inflicted with trees, many of them worthless strain trees, examples of which can usually be found in every citrus community, are living monuments to the wasted efforts due to neglect in the proper care in the prop-

(Continued on Page 43.)

Agricultural News Notes of the Pacific Coast

Northern California

Yuba County orchardists are holding pruning demonstrations.

Paradise, Butte County, has just dedicated a new $27,000 grammar school.

Business men of Sacramento recently made tour over Sutter Basin district.

Farm centers in Placer County have voted to make local dues $5 per year per member.

The chamber of commerce of Sacramento plans early erection of its own building.

The California Almond Growers Association recently completed a nut shelling plant at Sacramento.

Carlot shipments of celery are being made from Delta sections. Yield and quality declared never better.

The annual meeting of the California Grape Growers Exchange will take place in San Francisco, Tuesday, January 11.

Sacramento County farm bureau centers are holding cheese making demonstrations and teaching method of home manufacture.

The dairy department of Sonoma County farm bureau is closing its first year's work with two cow testing associations in full operation.

Sutter County farm bureaus are memorializing congress to give attention to tariff revision which will afford protection to producers.

Nevada County farmers are hoping for the creation of an irrigation district which will supply water to 30,000 acres of the county's richest lands.

Dr. J. P. Iverson, chief of the state division of animal industry, has recently been in Chicago attending a number of annual national livestock meetings.

The Tehama County farm bureau has just organized a market exchange. Membership fees are set at $25 and it is expected to have at least 200 members.

An effort is being made to reclaim 25,000 acres of Lassen County land by using the waters of Honey Lake. The situation is complicated, however, by dissenters.

Potato growers of Marin and Sonoma Counties met in San Francisco recently and formed a potato growers association under the prefix of "Northern California."

Rice growers of the Sacramento Valley are watching congressional action in the matter of two cent tariff on rice. Congressman Curry is pushing for the measure.

The acreage in rice will be greatly reduced another year, but many growers are already making preparation for next season's planting. Last season about 125,000 acres was planted.

The agricultural authorities of the state university declare that while Southern California now produces 90 per cent of the walnut crop, the center of the industry is moving rapidly northward.

The Glenn County Rice Growers Association has made an agreement with a milling firm to have rice dried, milled, sacked and marketed for $12.30 a ton; $1.60 a ton to be paid to grower on delivery.

Central California

Oakdale, Stanislaus County, reports eight inches of rain, "enough to insure good crops."

Ceres district, Stanislaus County, produced more than 1,000 cars of tree and vine fruits in 1920.

Several wells are being drilled on the 2,500 acre Hoover-Merritt ranch near Wasco, Kern County.

A power company reports recent extension lines to 306 new pumping plants in the San Joaquin Valley.

Olive growers of the Fresno district will not ship any olives eastward under prices prevailing at present.

Merced has just completed a new half million dollar pottery plant which will turn out its first stock in March.

The Yolo County farm bureau has asked Governor Stephens to appoint a farmer on the railroad commission.

The last farm bureau sale of hogs in Tulare County averaged $11.70 a hundred, quite a jump in price over recent sales.

The work of measuring the water supply of Kings River and canal systems, begun in 1918, is expected to be completed during 1921.

Stanislaus County farmers believe they saved $93,760 during 1920 by reason of the activities of the agricultural extension service.

Less than 2,000 tons of dried figs yet remain unsold in California and it is anticipated there will be a very light holdover, perhaps none.

A San Joaquin County ranch of 780 acres, of which 440 acres is in grapes, recently rented for $85,000 a year, or $425,000 for a five year lease.

W. H. Taylor, near Ceres, Stanislaus County, markets Everbearing strawberries right up to Christmas. "Use plenty of water" he says.

San Joaquin Valley farmers are urging the building of a 220 mile highway from Coalinga to Ventura by way of all the important oil districts.

Government engineers are investigating a project for bringing 140,000 acre feet of water per year from Mono Lake to Owens Valley, Inyo County.

An important county committee meeting of the Kern County farm bureau, postponed from December 25, will be held at Bakersfield January 8.

A meeting of vineyardists in Sacramento, December 22, adopted measures to restrict the spread of phylloxera, through dipping of infested vines.

Monterey County's beet sugar factory at Spreckels has had to close down temporarily as constant rains have seriously interfered with hauling of beets.

The Northern Tulare Citrus Association held its annual banquet for employes at Sultana on December 28; visitors being present from Sanger, Woodlake and Tipton.

January farm bureau meetings in Kern County will be at: Delano, 10; Old River, 11; Wasco, 12; Rio Bravo, 13; Edison-Fairfax, 14; Mountain View, 17; Pond, 19; Inyokern, 20; Rosedale, 21.

Farm bureau representatives from Fresno, Kings, Tulare, Kern and Madera Counties met at Fresno in December and agreed to vigorously fight against any attempted raise in rates by the utility companies of the state.

Southern California

The eleventh National Orange Show will be held in San Bernardino, February 18-28.

Imperial Valley hog raisers are refusing to market their animals at present low prices.

The orange crop of Riverside is heavier than last year, more small sizes, but promise of prices good.

Southern Pacific railroad officials estimate the 1921 cantaloupe crop of Imperial County at 21,000 car loads.

The third annual Walnut Growers Institute will be held in the walnut association's packing house, Whittier, January 14.

The board of supervisors of San Diego County appropriated $1,500 for the county's exhibit at the National Orange Show, February 18-28.

At a Fullerton, Orange County, farm center meeting 150 citrus growers urged that water transportation for citrus fruits and walnuts be encouraged.

On January 14 an all day walnut growers institute will be held at the walnut packing house, in Whittier, near the state school, on Santa Ana Boulevard.

Ranchers in the Magnolia school district of Orange County, near Garden Grove, recently held a meeting to arrange a pool for leasing 1,000 acres for drilling for oil.

Under the direction of Horticultural Inspector Pickering the La Habra Valley ranchers of Orange County are waging a war of poison against the Argentine ant.

Victorville, San Bernardino County, announces that a million dollar cement plant, with a 12 mile tram line connecting with the railroad, will be built there in the near future.

After ten cars of spinach out of a crop of 250 carloads in Imperial Valley had been shipped the growers stopped harvesting and will plow the remainder under. Poor prices.

Membership dues in the Orange County farm bureau have been raised to $5 a year, to provide a local fund for sending delegates to Sacramento to work for needed legislation, etc.

The total number of shipments of nursery stock coming into or moved from one part of Los Angeles County to another, during November, was 460, containing 48,064 trees and plants.

Application has been made by the Southern California Edison Company for a permit to develop 2,000.000 horse power of electric energy from the Colorado River above Boulder Canyon.

At a recent joint meeting of dairy committees from the farm bureaus of San Bernardino and Riverside Counties a new set of rules was adopted governing cow testing as to milk qualities.

Recent rainfalls in rice fields of Glenn and Colusa Counties have been so heavy that some growers have abandoned harvesting by machinery but may later harvest by hand or wait until spring.

A "Carob Corporation," for the purpose of "buying, selling, owning, growing and otherwise dealing in carob trees and their products," filed articles of incorporation at the Orange County court house, December 18.

The Coast and General

The Washington state horticultural association has elected F. F. Wiggens, Toppenish, president.

Northwest horse selling markets report: "Horse markets still in rut; dullness accentuated by holiday season."

The Farmers Union for the state of Washington recently met at Spokane and elected A. A. Elmore of Spokane president.

Almost every manufacturing center of the East reports great reduction in wage scales and often reduction in number employed.

Department of agriculture reports the value of farm crops this year as around $9,000,000,000, as against $14,000,000,000 last year.

The federal horticultural board is now admitting fruits from Cuba, the Bahamas, Jamaica and the canal zone only after vacuum fumigation.

Washington reports great reduction in number of cattle tick infested sections. California, formerly reporting 79,000 square miles infested, is now released.

Washington declares wholesale prices of commodities now lower than at any time since the war. The wholesale scale dropped eight per cent during November.

The salmon pack for 1920 in the total Alaska district aggregated 4,224,815 cases (four dozen to case), while Puget Sound and Columbia River sections produced 5,009,815 cases.

It is now thought that some of Nevada's "ghost cities" may be restored to life because of the present movement to take waters from the abandoned gold and silver mines and use in irrigation districts.

Trappers are urging all in their business to go on strike in order to check the radically declining prices of raw pelts. Several near Reno have been unable to sell raw furs at even 50 per cent discount on former prices.

Salmon canneries of the extreme northern Pacific Coast report products of three seasons still on hand. A $150,000,000 business is facing complete collapse while the retail price of a single can remains almost prohibitive.

Henry Scott of the Salt River Valley of Arizona has hauled what is probably the largest load of cotton ever delivered to an Arizona gin. The weight of this load was 17,270 pounds. This would gin out more than nine bales of cotton.

A series of farmers institutes under the direction of the local farm bureau have been held in various places in the Salt River Valley of Arizona. A poultry institute was held at Glendale under the direction of the Glendale Egg Producers Association.

The Wheat Growers Association of America was organized at Wichita, Kansas, last week. The first step taken was to advise Middle Western growers to hold till more satisfactory prices may be had. Membership of 100,000 has been announced.

The seed companies and grain companies of the Salt River Valley of Arizona have announced that they will finance farmers who will plant grain and other crops, to the extent of furnishing them seed and will wait until the harvest for reimbursement.

American Farm Bureau

THE address of President J. R. Howard, delivered before the second annual convention of the American Farm Bureau Federation, is filled with pungent sentences and touches upon much of interest to the farmers of the country. We give a number of detached sentences.

"The organization has grown in strength and power manyfold faster than it has grown in members, and the growth in membership has been more than we expected or hoped for. Those of you who attended the meeting in Chicago in March will remember, perhaps, that at its close I made a special request that we might in one year's time have a paid up membership of one million. Only nine months have passed since that organization meeting and we are already above the million."

"A thing is worth that at which it will sell, and had we had the money we could have bought every railroad for about 12 or 13 billion dollars and they asked an earning on 20 billion. Mr. Thorne was the only person to oppose this large figure. He succeeded in having this asked for valuation reduced and saved the farmers of America more than 100 million dollars. If we saved the farmers 100 million dollars in cash as the result of our first year's work, we have at least done something."

"The committee which we had at Washington for several weeks in conference with the treasury department with regard to income taxes and income tax reports succeeded in getting some new and more favorable rulings regarding the farmer's income taxes. It also succeeded in gaining the approval of the treasury department of a farmer's account book which was worked out by the committee in cooperation with the department of agriculture. That farmer's account book is, we think, better than any other that has ever been gotten together, and arrangements are made, or should be made, by every state farm bureau federation to get a copy of that book in the hands of every farmer by the first of January. By following the simple directions of the book the farmer can carry his accounts from page to page and transfer the footings at the end of the year to his income tax blank already printed in the back of the book. All he has to do then is to tear the perforated blank out of the book and his troubles are over for that year. That is, unless he is an unusual farmer and has something to pay."

"I think you will agree with me that there is entirely too much spread between the price to consumer and producer. It has been discussed at every farmer's meeting and I will not discuss it now. The farmer's business is primarily to produce. We constitute one-third of the people of the country. It has been the business of the other two-thirds to take care of the transportation, the marketing and the distribution. If they fail to do it with that degree of economy which will enable agriculture to fairly prosper, then perhaps the farmer himself will be compelled to venture farther into the field of production and take active interest in problems of marketing. That seems to be the case before us at this time."

"I sometimes wonder where we are going as a nation, anyhow. I have watched the growth of the cities and reflected uopn the country as it was when I was a boy, which was only a short time ago, and noted the remarkable rapid changes. Then I think of the stories that my mother has told—how she spun and wove the cloth, and I remember how she used to make all the clothing for the family. My grandmother has left us heirlooms of those things which she not only spun and wove but for which she prepared and carded the wool as well. If we cannot so arrange our national processes of marketing and distribution that the farmer can prosper, we are going to be forced as a nation to recede from the complexities of our present day life and revert toward the more simple life of the past. I certainly would not advocate the lowering of the standard of living or the standards of American life, but I sometimes wonder most seriously whether a movement back toward the more simple life would not mean a raising of the standard of living rather than a lowering."

"The serious problems which now confront us are not going to disappear at once. The farmer is going to have breakers ahead for the next five or six years. I don't look for any permanent readjustment very much earlier."

"We have produced a crop of more than three billion bushels of corn. Last June I bought corn to feed my pigs at the market price, which was $1.85 a bushel. I have the pigs yet, and I have a crop of corn, and if I could get any price offered at all for that corn at this time it would be less than 35 cents a bushel. If you will subtract 35 cents from $1.85 and multiply that by 3,200,000,000 bushels, which is the corn crop of this year, you will have a sum in excess of four and one-half billion dollars, which represents the slump on corn alone."

"The wheat farmer is in the best shape today of any farmer in the Union. His slump has been slow, and yet from the wheat growing districts every day reports to our office show that farmers are compelled, because of pressure brought uopn them, to sell not only their crops but their machinery and everything they have, and then they cannot pay their debts. That done, they are borrowing of their friends enough money to get into the cities where they can get work to support their families. Now that is the condition on the wheat farms, even though they are in the best shape today of any of the farmers. Men are being forced from the farms by dire need to obtain work to keep them from starving. That is the condition that is confronting us as a nation today. That is the condition, the situation, from which we must have relief."

"But I was telling you about the slump in prices. The wheat farmer's losses in this slump are practically a billion and a half dollars, the oats men, over a billion, and I don't know how much the other grain crop men have lost, but I do know that on our major crop alone the present slump in prices is more than the seven billion dollars which is the total, according to the press, of the entire slump. But cotton farmers have had losses, tremendous losses. The size of these is deplorable. Cotton is not selling at enough in many parts of the country to pay the price of picking. I couldn't picture it as bad as it is. Nobody can. The cotton loss alone is billions, and the Southern farmer must have our support and any relief we can give him. If we cannot give him relief, by all means let us extend him a hand of human sympathy."

"What about wool? Last year we got for our fleece wool, 3/8 staple, around 63 to 65 cents a pound. Last week 3/8 wool was actually sold at 12 cents a pound. Last week fat sheep sold in the market of South St. Louis at $1.29 a head and a band of 2,000 sheep at Chicago, after the costs of transportation and marketing were paid, netted a return to the grower of 34 cents a head and it cost the owner of those sheep to bring them through last winter $10 a head for feed."

"I read once somewhere where he that soweth to the winds will reap of the whirlwind, and as a nation—not as farmers, understand, but as a nation we have sowed to the wind and sometime we have sowed to the whirlwind. The result was inevitable. American business will not be upon a sound basis ever again until the purchasing power of the farmers of America is brought back to normal."

At Washington

CONGRESS seems to be trying to consider the needs of the food producer. At least, the producer is causing a whole lot of discussion in congress and in various committees. Agriculture never held such prominent place in the foreground. The packers control bill and the Baronna resolution to revive the war finance corporation both went through the house early in the session. The idea as to the war finance corporation is that its activities, if revived, will be largely to secure relief from present stringency in rural credits. The National Grange is maintaining offices in Washington and keeping track of the situation, and from that organization we have the following few notes regarding other activities of interest to agriculture:

Senators and members of the house, who had returned to Washington the week before the opening of congress, united in a conference committee on the state of agriculture, with Senator Norris of Nebraska presiding, and had examined Secretary of the Treasury Houston, Governor Harding of the federal reserve board, and a number of other witnesses, prior to the opening of congress. The facts as to the slump in farm prices and the credits stringency were put before this committee. The result was the preparation of several of the bills which were introduced early in the first week's session.

These relief measures fall into three general classes. The one most seriously considered is to do something to stimulate foreign trade. Another is to do something to increase the money available to loan to farmers. The third is to protect the agricultural products of the United States by embargoes against cheaper commodities imported from other countries. A fourth proposal has been made, but as yet without serious consideration, for the government to revitalize the grain administration and buy on government account the farm products now without a market, at some price which will pay cost of production.

Senators Calder and Gronna each introduced concurrent resolutions to provide for the rehabilitation of the war finance corporation. Similar resolutions are pending in the house. The Gronna resolution secured privileged consideration in the senate. Before it was passed it was changed materially by the addition of the words "and other products" to the list of agricultural products for which export finance help is to be provided. This resolution also originally contained a paragraph directing the federal reserve board to "take such action as may be necessary to permit the member banks of the federal reserve system in accordance with law and consistent with sound banking, to grant liberal concessions of credit to farmers of the country upon the security of agricultural products now held by them, by permitting the rediscounting of such notes of extension at the lowest possible rate of interest." This was practically stricken out and a declaration saying that "in the opinion of congress" such credit extensions should be made, was substituted.

Proposals to make more money available to farmers have taken two forms, one by Senator Hitchcock of Nebraska, to provide 100 million dollars from the United States treasury, to be handed to the federal land banks, to be loaned to farmers; the other, a direct advance to the federal reserve banking system to be loaned in the same way. Neither proposal has had definite consideration as yet.

The embargo as a remedy is proposed in a bill offered for the relief of the sheep and wool industry by Senator Smoot. Some other bills propose embargoes against any and all agricultural imports which come in competition with American farm products. The wool embargo has been considered by the agricultural and the finance committees in the senate and by the ways and means committee in the house, and is being given much approval.

The packers control bill was "unfinished business" in the senate when work was resumed. Debate is continuing and bids fair to keep on continuing. The Gronna bill, which is a modified form of the Kenyon bill, following closely the proposed bill submitted a year ago by the Grange representative, is the measure reported by the senate agricultural committee. It provides for a national food commission with broad powers. Senator Kenyon has proposed amendments giving this commission power to fix "fair" commission rates for handling livestock. The house bill has not been reported from committee yet.

Members of farm bureaus of Sutter, Eldorado and other northern counties are planning slaughter of beef, pork and mutton animals and marketing at prices below those now prevailing in butcher shops.

Plant Pears and Apples for Profit

Delicious Apple

Bartlett Pear

For commercial planting we offer Apples of all varieties on extra fine roots—Arkansas Black, Winesap, Black Ben Davis, Delicious, Jonathan, Rome Beauty, Stayman's Winesap, and White Winter Pearmain. Our Bartlett Pears on Japan roots, and Bartlett Dwarfs—double worked on Beurre Hardy and Quince roots, are also supplied in commercial quantities.

We take unusual pride in the quality of these trees which we are shipping in large quantities to all parts of the state. The robust character of the trees, their good root system, and our careful method of digging, handling and packing insures their safe arrival at far-distant points.

The Almond: Cultural Methods

BEGINNING with the issue of December 4, the Cultivator presents a series of letters written by Manager T. C. Tucker of the California Almond Growers Exchange. The first touches on history and the beginnings of cultural methods. Hints and suggestions as to orchard practice are continued below at greater length. Another issue will continue Mr. Tucker's discussion of growing methods which produce Blue Diamond quality.

Growing a Perfect Almond

Beginning with the second year the almond tree is shaped for future usefulness. The following instructions should be carefully observed in cultivating the almond of commerce:

In pruning start it low down as a matter of protection to the tree itself, also to shade the ground, to prevent evaporation and for convenience in harvesting the crop at the time of maturity of the tree. Carefully train the main branches so that the nuts may be produced on all quarters of the tree. Do this carefully and later pruning will consist of an occasional thinning out only.

Remove all water shoots, or suckers. They rob the tree of much of its substance that should go to the crop. The wood of the almond is very hard and strong, enabling the tree to bear the weight of heavy crops where pruning has been given proper attention during the formative period of the young tree.

Almonds are of two general classes, sweet and bitter. The former is primarily the almond of commerce, the latter is used largely in the manufacture of almond oil and almond flavoring, as well as in the manufacture of prussic acid. The bitter almond is also used largely in nurseries as a root stock upon which to bud the almond and some other fruits.

The greatest proportion of almonds grown in California are on almond roots. Where the most desirable soil, moisture and drainage conditions exist, it is best to select the almond root. Orchard almond trees are never grown from seed, as they do not reproduce true to type, but are propagated by budding desirable varieties on seedling roots in the manner commonly employed in nursery practices for other stone fruits, like the peach. Every grower must decide, however, on what root stocks he will plant his trees.

The bitter almond is often recommended as being superior to the sweet almond as a stock. This claim has never been proved. Experiments indicate that there is fully as much variation between the bitter almond seedlings grown from seed from different trees as there is between seedlings from bitter and sweet almonds. Both are equally subject to attack by gophers. The grower's chief object, therefore, should be to secure as healthy, vigorous trees as possible, whether they be on sweet or bitter almond roots.

Often through injudicious selection of varieties for original plantings, or for some other reason, it becomes desirable to work over old trees to more desirable varieties. This may be done by budding or grafting.

There are two kinds of mites that do much damage in almond orchards, the brown or almond mite and the yellow or two spotted mite. Both are common in all parts of the state and are the worst pests the almond grower must regularly face. These insect pests attack the tree but do not attack the almond proper, for when the tree is defoliated this causes the premature ripening of nuts and results in quite a loss.

The brown mite is the larger of the two, is dark red or brown in adult stage, has very long front legs and a flattened back. It does not spin any web and works on the green bark of the small twigs as well as on the leaves, sucking the plant juices from beneath the bark. It causes a mottling of the leaves, which eventually fall, although not as readily or in such large numbers as when attacked by the yellow mite. The injury to the tree is equally as great because of the serious drain on the vitality as a whole and because it commences work earlier in the season. This mite may spend its entire life on the tree, the very small, round, red eggs being laid largely on the under side of the branches and in cracks and crevices in the bark and twigs. These remain on the tree throughout the winter and hatch early in the spring soon after the trees have their leaves half developed, leaving the white egshells in place. Most of their work is done in the spring and early summer.

The brown mite may be controlled satisfactorily by means of a dormant spray of lime-sulphur solution. Crude oil emulsion as a dormant spray is also effective, if thoroughly applied over the entire tree under high pressure. This also applies to applications of the lime-sulphur spray.

During the growing season a milder material must be used. Dry dust sulphur, using only the very finest grade of "flowers of sulphur," is often very effective, provided weather conditions are satisfactory, but generally this must be applied a number of times if best results are to be obtained. The work is done by blowing the sulphur dust into the tree with blowers in the early morning when there is little or no wind.

The yellow mite is much smaller than the brown mite and is of a pale yellow color with occasionally a reddish tinge and sometimes with two darker spots on either side of the body. Unlike the brown mite, the winter is spent in concealment somewhere, presumably off the tree. During the warm days of early summer, generally in June, the mite makes its appearance on the trees, spinning a fine web on the leaves, generally on the upper surface, and then works under this web. The mite sucks the plant juices from the leaves, giving them a yellowish mottled appearance. These leaves soon die and drop to the ground. In serious infestations the trees are often almost completely defoliated by the end of August.

The mites are much more easily controlled where a comparatively high percentage of moisture is kept in the soil by frequent cultivations. The Exchange constantly calls the growers' attention to the proper cultivation needed during the different seasons.

There are other pests, such as the gopher, squirrel, birds and morning glory.

Gophers often do great damage to the trees by girdling them just below the surface of the ground. The only safe means of control is the constant use of traps supplemented by poisoned bait.

Squirrels are very troublesome, as they harvest a large amount of almonds before they are sufficiently ripe to be harvested by the grower. The use of poisoned grain or "gas," if used over a large area of surrounding territory, will prevent serious depredations.

Birds also carry off large amounts of almonds if the orchards are near open country or hills, especially if wooded.

The morning glory is probably the worst of the weeds in the almond orchards, and is the hardest to control. Sheep and chickens may be used with excellent results.

Our object in telling you who are interested commercially in the almond about these costs and troubles is so that you may realize that the return to the almond grower is not all velvet. Fortunately, the pest with which we must contend affects the tree only and not the quality of the nut. Production, however, is materially decreased.

TREES ON WHICH PRUNES GROW

The Leonard Coates Nursery of Morganhill is now mailing its 1921 catalog. It makes one of the best showings of French prunes of any catalog we have seen. A hint of this is given on the cover with its magnificent cluster of prunes in natural color. At first one remarks, "It is too highly colored," but a big type of prune grown on a healthy, vigorous tree takes on high colors, and we conclude that the Coates cover is true to life. In any case, it's a magnificent piece of work. The back cover is given over to a cluster of oleanders, and the two covers give an idea of the range in the catalogue, for nearly everything which grows is included.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"The use of a truck on Goodyear Cord Tires has enabled me to release three teams and three drivers from threshing work and is shortening the length of my harvesting season three to four weeks, thus helping the thresher to finish the job while good weather lasts. The pneumatics roll easily over plowed fields, through stubble, barnyard mud, snow and so on. At 12,000 miles, they look good for 12,000 more."—Carl J. Gustafson, Owner of Willow Grove Farm, near Aberdeen, South Dakota

MORE and more farmers constantly are reporting, as above, marked benefits obtained from motorization and particularly from motor trucks on Goodyear Cord Tires.

They have found that quick field hauling assists power-machines by prompt supply and removal of loads, and that the pneumatics make such hauling possible.

A sturdy truck on Goodyear Cord Tires, therefore, is of vital aid to year 'round motor-farming; to motorized pumping, spraying, threshing, silo-filling, feed-grinding and other work.

Pneumatic traction overcomes soggy, slippery going; pneumatic cushioning prevents severe shaking and loss of load; pneumatic activity saves much time.

By the development of the rugged Goodyear Cord construction, all these advantages of the big pneumatics have been made most intensely practical for farm service.

Farmers' accounts of how motorization and pneumatics have saved labor, crops, time and money, can be obtained from The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

GOODYEAR

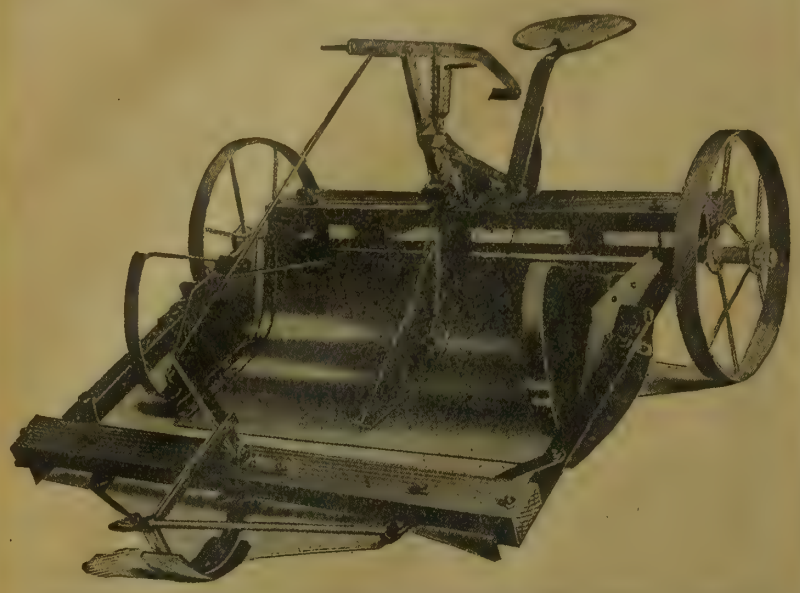
CORD TIRES

The Miskin Scraper

IS

THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars



The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market and is guaranteed to take twice the dirt per trip with the same horsepower.

Made in 2-horse, 3-horse and 4-horse sizes. Can be operated by small tractors from the tractor seat by the tractor driver.

Send for descriptive circulars, with prices or ask your dealer to send for one on approval. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

TEAGUE TREES

Ask the man who has planted them and he will tell you that Teague Trees are unequaled in growth and productiveness.

They are the best that can be produced.

If you intend planting CITRUS TREES it will pay you to come and see our stock and let us figure on your requirements while we still have a good assortment to select from, as the supply of good trees is limited.

Avocados, Feijoas and other Tropical fruit trees in all of the recommended varieties.

Send for our new descriptive price list and tell us what you intend to plant.

The R. M. Teague Nurseries

Box A San Dimas, California

Founded in 1889 by R. M. Teague

PERFORATED TREE PROTECTOR

that will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

COLLAPSIBLE PLANTING POTS

Why not raise your early

Tomatoes, cabbage, chili, and egg plant for home use or for market. Do you know that you can start Cucumbers, Cantaloupes, Melons of all kinds in these pots in flats until they have three and four leaves, then plant pot and all, have melons two or three weeks earlier for market. Just the thing for Propagating Eucalyptus and Olive cuttings.

Write for samples and prices of both Pots and Protectors. State which you are interested in.

Water Made Hog Wallows

By D. J. Whitney

ABOUT a year ago Prof. Gordon Surr had a very instructive article in the Cultivator on the formation of hog wallows. It was illustrated by a photo taken within a short distance of my ranch. As I had heard a great deal of conjecture upon the probable origin of these little "hills and hollows," and Prof. Surr's explanation was the first explanation within reason, I was glad to get it.

His idea in brief, as I remember it, was that the hillocks were probably wind formed, a dense bush catching wind moved material and continuing to do so until they had reached their present size. The explanation, as I remember, was not positive, but put forward as a theory, since in some parts of the world land is now taking this hill and hollow form where conditions favor.

Although the theory was interesting I questioned it for several reasons in the case of the red, sandy clay hog wallows so common in parts of the San Joaquin and Sacramento Valleys.

In the first place the texture of this soil is such that it seemed impossible that it could have been gathered together by wind. Wind gathered material, one would think, would be of a loose, or easily moved nature. These hog wallows are of a clay sand formation and hold their shape like a brick. Run a furrow through a hog wallow and it will be there ten years later unless tramped in by cattle in spots when wet. The wind will not move it away, wet or dry. Naturally it would appear improbable that the wind ever carried it there.

For another thing it would seem that wind formed material, unless mostly sand, which this is not, would be of a general character, if that expresses the idea intended. This soil, however, is of such a definite type that it evidently must have had some definite, unusual source. It is, for example, far more red than most surrounding soils. It is very high in clay and very high in sand with a very limited amount of intermediate material, as compared with the average soil.

Lastly, small water washed pebbles can be found abundantly in it and these are as often found toward the top of the bumps as below the general land level. This fact would make a wind formed origin almost impossible

The preceding indicates the improbability of wind having caused them. Now for a positive suggestion as to their source.

I discussed this with Dr. P. A. Boncquet of Lindsay recently and he gave me the first likely theory of their origin, which follows.

The interior valley of California seems clearly to have been a lake bed once. As the water receded the land where the hog wallows are was barely covered; in dry periods it would be exposed to the air and in wet periods it would again be covered with water. Tules and other water plants would grow there. The water working down toward the lower parts of the valley would wash the dirt away from between the clumps of tules, but the tules would catch the clay suspended in the water and in times of flood it would even catch sand and the little water washed pebbles so commonly found in them now. Consequently where the tule clumps were are now the hillocks, and between them, where the water flowed on its way to lower levels, are the hollows. After the water receded for good and hundreds of years of hot, dry summers followed, all trace of tules was destroyed and very little of the soil, except the earthy or mineral matter was left.

It can be seen that there is a very close parallel between the wind and water methods of origin. Clumps of vegetable matter in each case hold earthy material carried along, in one case by the wind, in the other case by water.

If this soil had been laid down in water it would seem very probable that it must be rich in plant food, like all sediment soils. As a matter of fact it is rich, as proved by chemical analysis in theory, and by plant growth in practice, once it is leveled, irrigated and subdued to a state of good cultivation, even though in a state of nature its peculiar characteristics make it extremely barren and forbidding of aspect.

When the correct origin of this land is finally admitted it will stop a great amount of conjecture and give rest to puzzled brains, for every person who sees such land wonders how it ever got that way.

Cover Crops

California orchardists have often referred to the old time methods where back in the New England, or possibly the Middle Western states, the hillside orchards were allowed to to be covered for years, perhaps generations, by the growth of timothy or natural grasses. The only implement ever admitted to the orchard was the mowing machine which sometimes removed the surplus or, perhaps, mowed the grass and allowed it to rest upon the sward as an additional mulch.

Reference to this old time method often called forth comparison with California's up-to-date cultural methods. But are our clean cultural methods as generally declared the best as they were ten years ago? They are not. We recently had an interview with A. B. Humphrey of Escalon, San Joaquin County, Mr. Humphrey formerly gave clean culture to all his orchards. He continued this until the soil bore closer resemblance to brick clay than to productive soil. This was especially true of the pear orchard. Mr. Humphrey believes in asking; "How do others do it," and he recalled that near Buffalo, New York, there were apple orchards which, for more than 150 years, had borne heavy crop without a cultivator ever being under the trees. In case of windfalls the sod growth of many years afforded softest of cushions for the falling fruit, and while such fruit is of lesser value it still has some value when left clean and unbruised by its dropping. On the sharp clods of a fairly heavy soil under clean culture a windfall becomes worthless unless immediately used in cider mill or other means of saving waste products.

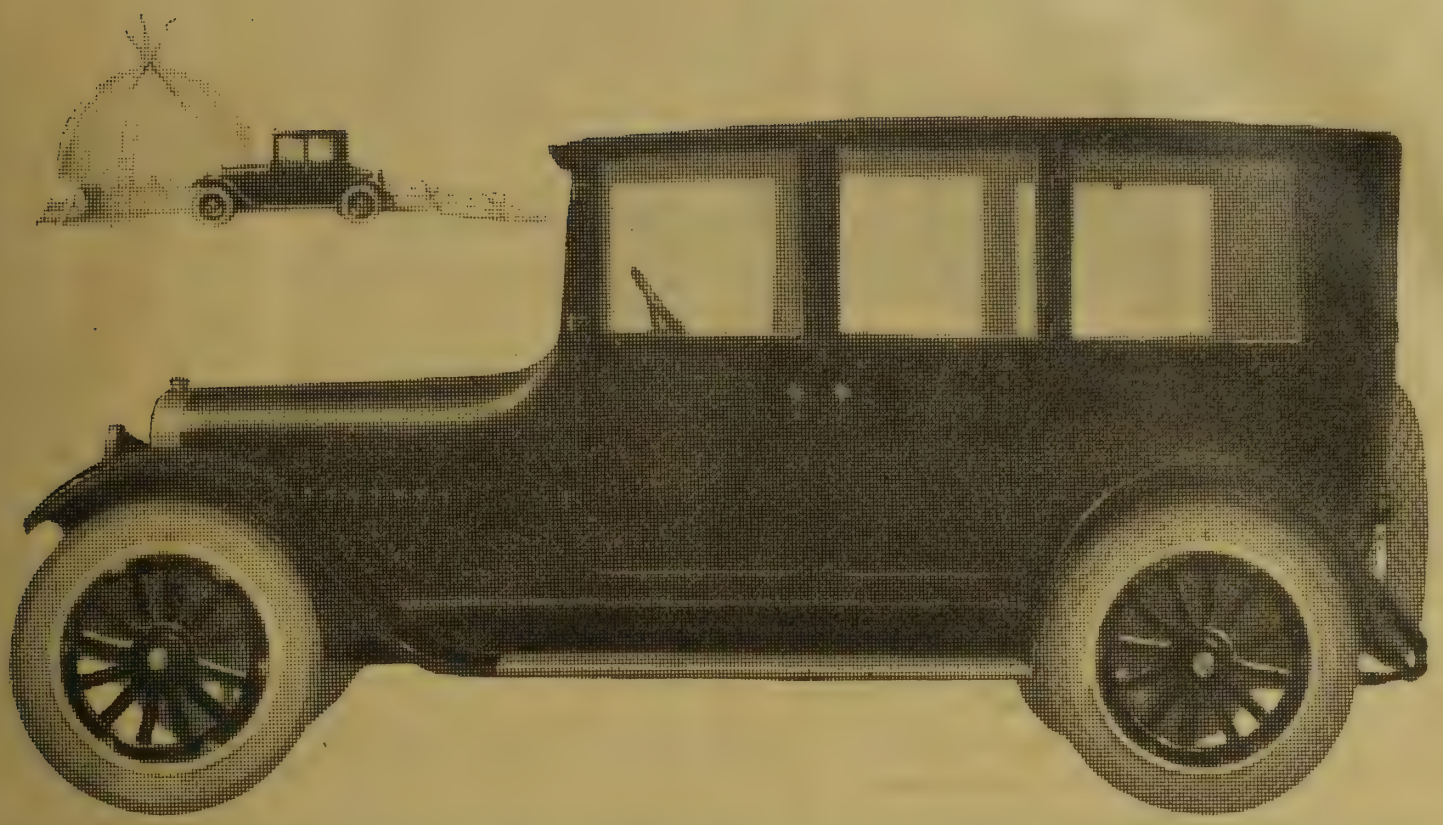
Mr. Humphrey has been regarded as one of our larger and more enthusiastic producers of pure bred livestock, but he confided to us that originally his entire business was in the growing of grapes, pears and a few other fruits. In fact, his fruit growing interests are still vastly greater than his livestock interests which were taken up purely that his orchards and vineyards might be restored to fertility and made profitable. Now, with the wastes of the barns and stables brought to the land, it is being greatly increased in productivity and yet Mr. Humphrey is becoming confirmed in his belief that in addition the soil requires the continuous covering which he is now allowing in most of his orchards.

He has consistently followed the plan for 15 years, he never plows, though sometimes in late fall to prepare the land for receiving the winter rains he uses the disk. In addition, through the winter season, hogs, and even cattle, are allowed to graze through the orchards. The damage to the tree is more than overcome by the benefit to the soil. Besides, there are summer cuttings of alfalfa made, sometimes as many as four. Without question this method of handling an orchard calls for greater supply of water. He has small stream running continuously and this is diverted from section to section until he knows that the trees have sufficient with the required surplus to keep the cover crop going.—C. B. M.

Arrangements have been made whereby every citrus grower in the Santa Ana-Tustin-Orange district having a telephone may be warned of probable frosts by the United States weather bureau.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES



THIS NEW OAKLAND SENSIBLE SIX FOUR DOOR SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

WHAT does the possession of this new Oakland Sensible Six Sedan mean to the farmer who drives it? It means, first of all, reliable transportation of the highest order, at the minimum of attention and expense. It means the saving of his time, in his trips to market or about the countryside, and the saving of his energy as well. It means to his family greater comfort and convenience, and an increased opportunity for recreation. Sturdy as Oakland cars always have been, this new Oakland is yet more sturdy through an even stronger chassis of longer wheelbase. Powerful, thrifty and dependable—useful the whole year 'round—it offers a value not to be equaled in any other type of car.

Oakland Coupe $1395; Roadster, $1395; Four Door Sedan, $2065; Coupe, $2065; F. O. B. Factory, Pontiac, Michigan. Additional for Wire Wheel Equipment, $85

SPRYWHEEL

TRADE MARK

PRICE $170 DELIVERED
ONE GALLON
ONE DAYS FUEL

Nurserymen—Seedmen—Truck Gardeners Market Gardeners—Florists and Home Gardeners!!

By a Special Contract with H. C. Dodge, Inc. of New York and Boston, manufacturers of the SPRYWHEEL, the Economy Cultivator & Implement Co. have been appointed Distributors for Southern California, and will maintain Demonstration and Service Men in Los Angeles, San Bernardino, Riverside, Orange, San Diego and Imperial Counties.

A complete line of repair parts, tools and attachments will be carried at all times, assuring prompt and efficient service on short notice.

The Sprywheel opens up a new era in farming: It makes power cultivation practical and economical. No matter how narrow the row or how tall the plants, the Sprywheel does the work at all stages of growth. It hoes, weeds, mulches and hills with any Planet Junior Acme-Springfield tool so easily, so fast, so economically that no grower can afford to pass up the extra yield and profit that come from thorough cultivation.

FREE DEMONSTRATION BY APPOINTMENT

If you are interested and wish to see the SPRYWHEEL at work on your own land,—or if you wish us to mail you our Free Descriptive Catalog, mail the coupon today. Indicate whether you wish demonstration or catalog or coupon.

Please send me your Free 16 page Illustrated Catalog of the Sprywheel.

I am interested in a Free Demonstration of the Sprywheel on my land. Please advise convenient date.

Slitting Trees

ROLAND C. CASAD of Covina is a believer in bark slitting for increasing the vigor and growth of citrus and other trees. Especially does he think it beneficial in the case of scaly bark. So strong is his belief that he has issued a booklet on tree surgery in which the slitting and its advantages are described at some length. In part he says:

"If a pruner's knife or the like is used, and parallel slits with the limbs or trunk are made in the bark, it permits the bark to expand and the sap to flow more freely, and as it is sap that nourishes the tree, fruit and foliage, you will note a decided improvement.

"One can increase the size of the limbs and trunk very much by this method. The time to slit the tree's bark will depend upon the location and kind of a tree, but it should be done just as the tree is commencing to grow in the springtime, when it is blossoming or just as the fruit is setting.

"This should not be done in the fall of the year, especially where the winters are cold, as the wound would not have time to heal and form the scar tissue necessary to the protection of the tree before cold weather."

As to young trees, he suggests:

"Many young trees, especially orange trees, die before they get started well. This oftentimes comes as a result of the shock they get in cutting their roots and digging them out of the nursery.

"If, after the young tree is transplanted, you take a knife and cut one or two perpendicular slits in the bark of the trunk of the tree you will find that it will start growing much sooner and grow much faster. This is because, owing to the shock the young tree had, it is liable to become bark bound. This process will loosen the bark and the tree will take on a new lease of life."

The method was very thoroughly tried out some years ago, especially in the summer of 1912. The extreme cold of that January 1913 following seemed to have a more injurious effect on these slitted trees, and many growers resolved never to repeat the experiment. We believe Dr. Webber and others still condemn the practice.

Wealth in Onions

By James P. Britt

A great many of the growers and distributors of California are very much interested in the development of the sweet Spanish onion crop, which as an industry has now reached such proportions as to attract nation wide attention. Southern California enjoys the very unique distinction of being the only place in the United States where the sweet Spanish onion is produced in commercial quantities.

Gilbert B. Daniels, state market director, has conducted qiute an extensive survey of this product and states that there will be approximately 300 acres of these onions produced next year in the counties of San Bernardino and Riverside, which, he says, are the only places in the United States where this particular onion is produced to any commercial extent or value. It is estimated that there will be marketed this year from these two counties in the neighborhood of 100 carloads of these onions. There will be about 75 acres just west of Chino and about 50 acres in and about Riverside. The balance of the acreage will be in the vicinity of San Jacinto, Riverside County.

The sweet Spanish onion is large and sound, the onions averaging almost a pound in weight. The original onions were procured in Spain, and since then the seed has been produced in the two Southern California counties mentioned. The seed is planted between the fifteenth of December and first of January, and the crop is harvested in September, which makes it a nine months' crop. Thus far the growers have been able to secure a price of six to eight cents per pound at shipping point, and they feel hopeful that they will be able to do as well the coming year.

After a great deal of experiment it has been demonstrated that the peculiar soil and climatic conditions of these two counties of Southern California are similar to that of the southern part of Spain where large quantities of sweet Spanish onions are grown.

The difficulties that the producers of the sweet Spanish onions are attempting to solve now are those of marketing the product. Mr. Daniels, who is assisting the growers in the distribution of the onions, is endeavoring to work out a plan for an auction market in New York City, and possibly Chicago, similar to that which is now conducted by the Fruit Growers Exchange.

Storage Apples and Grade Requirements

It is the opinion of the office of inspection of the state department of agriculture that it is not the intent of the apple standardization law to hold the packer responsible in cases where the fruit has deteriorated in storage to such an extent that when placed on sale it does not meet the requirements of the grade as stamped on the box, provided that upon reinspection it is determined beyond reasonable doubt that the stock was up to grade when packed.

There are certain inherent characteristics of apples made a part of the California grade requirements which will not change even under extended periods of storage, such as size, variety, pack, etc. It is true that an apple may shrink somewhat in storage, but for general purposes of inspection we may say that the size factor is fairly constant. Deterioration and decay, on the other hand, are factors which must be expected with apples which are kept in storage for any length of time.

It would be our opinion, therefore, that packers should not be held responsible for the sale of storage stock owned by a second or third party at time of sale, which we have every reason to believe was packed in accordance with the law, but which when offered for sale does not meet the requirements of the grade as stamped on the container.

Such a ruling does not mean that the owner of storage stock, usually a wholesaler or jobber, but in some cases the original packer, can offer for sale apples which have deteriorated to such an extent that grade requirements are not met. It is the privilege of the inspector to ask that such stock be reconditioned. At the same time such cases should be considered on their merits and if the storage stock ran slightly over the total tolerance of defects provided in the law, and it was determined that the requirements were met at time of packing, inspectors are always permitted to use their judgment as to whether they will ask such reconditioning. If the owner of apples not meeting grade requirements refuses to recondition the stock, such procedure on his part cannot be required under the present law, but inspectors may bring suit and the court may impose such conditions as the evidence warrants.

There is no question involved in the reinspection of storage stock concerning payment for such examination. The apple law does not give us the authority to require payment for any inspection work. It merely provides for the earning of funds with which to maintain the law by the sale of apple stamps, the purchase of which is in no way compulsory. Police powers such as reinspection of storage apples for grade should be financed by the state or county in the regulation manner.—F. W. R.

AVOCADOS FROM COLOMBIA

In commenting on the avocado industry of the Santa Marta district of Colombia, Consul Sawyer expresses the opinion that its further development depends largely upon improved shipping facilities. "At present refrigeration space on the steamers which transport the fruit is reported to be limited in amount as well as expensive. Once this problem is met there should be considerable profit in the industry, since the fruit which can be purchased in Santa Marta at from three to five cents retails on the New York market at from 50 to 75 cents each.

"Avocado culture is not carried on systematically in the Santa Marta district; the trees occur for the most part as shade trees on cocoa plantations or around the homes of the planters and field hands. It is estimated that in the rather limited cultivated area adjacent to Santa Marta there are between 3,000 and 5,000 large avocado trees, the greater number of which are over 25 years old. It is largely these trees that supply the New York market. Because of climatic conditions, the avocado of Santa Marta ripens earlier than those of certain other parts of the American tropics and much earlier than those of subtropical regions such as Florida. Accordingly, it has been found profitable to ship the Colombian fruit to American markets during the months of April and May and part of June. During the season of 1920 there were shipped from Santa Marta 1,648 crates of avocados, valued at $4,974."

PROGRAM FOR WALNUT INSTITUTE

The third annual walnut growers institute will be held at Whittier, Friday, January 14, in the Whittier Walnut Association packing house. A basket lunch will be served at noon, with coffee furnished by the Whittier farm bureau center.

10 a. m.: The Agricultural Extension Service, the Farm Bureau and the Walnut Grower, Farm Adviser Hodgson. Importance of Maintaining High Standard of Quality in California Walnut Shipments, H. C. Sharp. Economic Losses Due to Non-productive Trees, Dr. L. D. Batchelor. New Developments in Dust Spraying, R. E. Smith. Basket luncheon.

1:30 p. m.: The Codling Moth Situation, Prof. H. J. Quayle. Foot Rot of the Walnut, Dr. H. S. Fawcett. Top Grafting Poor Yielding Walnut Trees, Dr. L. D. Batchelor. Selecting the Orchard Tractor, Prof. L. J. Fletcher.

NATIONAL ORANGE SHOW

The National Orange Show management has been keeping quiet; at the same time sawing wood and growing oranges. It now proposes to make a whirlwind finish in its campaign of staging "the greatest ever." The show will take the entire week of February 20-26. It will be in charge of Manager Renfro as heretofore, and practically the entire board and committee membership is made up of experienced workers. California oranges were never nicer. It will be a great show.

On Friday and Saturday, February 25 and 26, the citrus institute, now a regularly organized body of citrus growers, under direction of Dr. J. T. Barrett of the experiment station will hold its mid-winter annual. There will be discussion of fumigation, spraying, marketing, transportation, tractive power for citrus orchards and other live questions.

WATSONVILLE APPLE CROP

According to present advices, there will be a total of 2,200 000 boxes of apples shipped from the Watsonville section this season, or approximately 300,000 boxes less than was shipped last year. There are about 200,000 boxes, loose and packed, in cold storage in Watsonville and about 400,000 boxes in other cities throughout the state, mostly in San Francisco and Los Angeles. In addition there is some stock in common storage.—F. W. R.

Contra Costa County farmers have formed an association for cooperative marketing and cooperative purchasing. The farm bureau headquarters is at Concord.

CONTROL MEASURES FOR "BROWN ROT"

The best authorities on plant diseases still differ somewhat in their opinions as to the complete control of brown rot. It is, however, apparent that certain definite practices in orchard sanitation are of value in checking its ravages and that spraying practices are necessary for its practical control. Even with the best of methods this fungus disease is difficult to control under unfavorable weather conditions.

Control methods should unquestionably begin in the fall or even in the summer. The infected branches should be carefully pruned away and burned. All decayed fruit should likewise be destroyed and every precaution taken to remove the mummified fruit remaining on the tree during the winter. This should either be burned or thoroughly covered by plowing.

With the best possible cleanup in an orchard it would be practically impossible to remove all sources from which the brown rot spores originate. It then becomes necessary to destroy such spores as may adhere to the bark or bud scales by the application of an effective fungicide. This may necessitate one, two, or more sprayings, depending upon the effectiveness of the materials used and the thoroughness with which the work is done. Either the Bordeaux mixture (6-6-50) or the lime-sulphur, winter strength, should destroy all spores actually saturated with the fungicide in early spring before the breaking of the buds. Fall spraying is unquestionably of value but should not be completely relied upon because many additional spores of the brown rot disease may again become lodged on the bud scales between the time of fall spraying and the blossoming period.

The value of spraying after the blossoming period is unquestionably reduced because it is practically impossible to reach the diseased tissue within the fruit spurs and twigs by the external application of a fungicide. A lime-sulphur spray (1-15) at the time the blossoms are opening and another application (1-25) after blossoming is sometimes recommended. Additional sprayings with wetable sulphurs are also sometimes applied to protect the growing fruit.

The most successful results to date have been secured by Dr. W. L. Howard of the deciduous fruit experiment station of the University of California at Mountain View. Until these results are published detailed information can undoubtedly be obtained by writing direct to the station. In the meantime the experiments will be continued next spring.—T. D. Urbahns.

BUD SELECTION IN THE CITRUS

(Continued from Page 35.)

agation of the trees. The writer perhaps comes into more frequent contact with such examples than is usually the case, on account of his work. Every time that such an orchard is visited, where the question of top-working the undesirable trees or replanting them must be considered, the importance of using selected buds for propagation becomes particularly impressive. Some of these cases are brought to the courts for adjustment but the compensation awarded hardly, if ever, makes up for the wasted effort in the cultivation of the worthless and undesirable trees. It emphasizes as nothing else can the importance of the growers investigating the methods of propagation used in the growing of their trees and the source of buds used for top-working.

Sources of Reliable Trees and Buds

The Fruit Growers Supply Company of the California Fruit Growers Exchange maintains a bud department, as a public service, which furnishes to growers and nurserymen reliable buds for propagation. This organization has complete records of nurserymen using reliable buds and who have reliable trees for sale, and this information is available to all prospective planters who desire to avail themselves of it. This information is of great importance to prospective planters and every one who is concerned in the planting of citrus orchards or the top-working of established but undesirable trees.

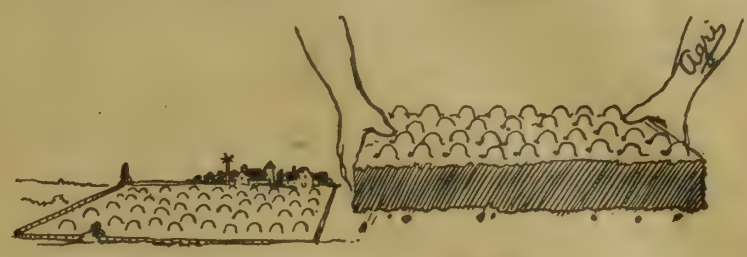
In the case of top-working established trees and orchards this organization has on file a list of men who make a business of top-working citrus trees. This work is usually most economically and successfully done by men who have had experience along this line. It requires patience, experience, and the ability to do this particular kind of work, sometimes called the "growing hand." Unless it can be given the necessary care and attention, it is a question as to whether it is worth while or desirable.

The importance of using carefully selected buds for propagation secured from superior performance record trees is not questioned by any experienced person.

TEHAMA COUNTY FARM BUREAU DATES

The Tehama County farm bureau centers will meet in January, 1921, at: Dairyville, 12; Antelope, 13; Oak Park, 14; Richfield, 17; Corning, 20; Bend, 21; Los Molinos, 24; Proberta, 26; Liberal, 27; Manton, 28; Bowman, 29; directors meeting, Red Bluff, January 22 at 10:30 a. m.

A plant for the manufacture from kelp of wallboard, cardboard and roofing is to be erected at Summerland, Santa Barbara County.



Alfalfa Growers:

Agri will add acres to your present yield

State Experiment Stations and Agricultural Colleges have definitely proven that AGRI Gypsum not only greatly increases the yield of alfalfa but also gives a better stand, a much darker color and a crop remarkably free from weeds.

AGRI Gypsum supplies sulphur which is one of the most important elements in alfalfa growth and lack of which is the commonest cause of thin crops.

AGRI Gypsum also furnishes calcium, adds to the nitrogen supply, releases potash and corrects black alkali.

Write for free book illustrated with photographs of increased alfalfa crops.

Growing Sugar Beets and Utilizing the By-Products

SANDY loams and clay loams are generally regarded as the best soils for the production of sugar beets though the physical condition of the soil is greatly influenced by its preparation and the cultural methods used. In general, if a soil has produced good crops of corn or potatoes it may be assumed that it will be satisfactory for the production of sugar bets, say specialists of the United States department of agriculture, in Farmers Bulletin 568, "Sugar Beet Growing Under Humid Conditions," recently issued. Hardpan subsoils should be avoided by the sugar beet planter, especially if they are so near the surface as to interfere with the development of the roots, while soils that permit rapid leaching are not satisfactory to beet culture, as the moisture passes out too rapidly and carries away the soluble plant food so essential to proper growth.

Fertility is essential. It can be maintained by the use of stable manure, green crops plowed under, or by the application of chemical fertilizers. Few farms produce enough stable manure to keep the land alive by this means alone, and the proper treatment of a sugar beet soil will combine all three sources of plant food. No rotation should be planned that does not include one green crop to be plowed under. Stable manure and green crops furnish the humus (vegetable material) which serves as plant food and also is essential to the growth of soil organisms that improve the fertility in a manner that can not be secured through the use of chemical mixtures alone. Moreover, the presence of organic matter in the soil enables it to retain its humidity and better to resist a drouth. Deep fall plowing of sugar beet land is one way to insure a supply of moisture for the next year's crop and to improve the physical condition of the soil through the action of the rains and frosts of winter.

The primary aim in fitting seed beds for the sugar beet is to secure a plot that is deep, fine and firm. The disking harrow, the spike toothed harrow and a roller are the tools required to develop fully the advantages gained by deep plowing.

Effect of Temperature

An average temperature of about 70 degrees Fahrenheit during the growing season, usually from May to September, together with cool nights and moderately warm days toward the latter part of the season, appear to be most favorable to the growth of the plant and the storage of sugar in the root. If the average temperature is much above this apparently sugar is not formed so readily or it may be that it is used in the growth of the plant as fast as it is formed.

In addition to an equable, moderate temperature the crop requires plenty of moisture. Rainfall cannot be regulated by the farmer, but water in the soil can be conserved by proper cultivation and under draining.

By-Products

The sugar beet industry is the source of several by-products which may be used to advantage by the grower. The tops which are removed when the roots are harvested and the pulp remaining after the extraction of the sugar from the roots at the mill are of particular value for feeding animals, especially cattle and sheep; they are fed fresh, dry, or as silage.

The tops may be pastured in the fields where they have been thrown down after cutting. This will save cost of hauling and result in direct application of manure to the soil. However, it may result in waste of this valuable feeding material and the soil may lose its condition to a certain extent through excessive trampling. It is advantageous to feed the tops, either fresh, cured, or as silage, in feeding racks. Farmers sometimes sell the tops at a rate ranging from $2.50 to $5 per acre, but this is a poor practice, both from the standpoint of the value of the tops as feed and from the fact that the removal of the tops means a removal of fertilizer material.

Pulp also constitutes a valuable feeding material and its use results in returning to the soil a part of the material that has been removed. One dealer in dry beet pulp guarantees the product to contain not less than eight per cent of protein, not less than one-half of one per cent of fat, not less than four per cent of sugar and starch, not less than 58 per cent of carbohydrates, not over 20 per cent of fiber, and 2½ per cent ash.

Certain beet sugar factories produce molasses as a by-product. This constitutes a valuable carbohydrate feeding material and is usually fed by mixing with hay, pulp, etc.

Utilizing these by-products in feeding livestock, the grower may obtain a considerable profit other than that obtained by selling the roots and, of very great importance, he may retain on his field a large part of the fertilizer materials removed by the crop.

Waste lime is still another by-product of the sugar factory which is extremely useful for neutralizing acid soils.

Methods of preparing the soil, planting sugar beet seed, cultivating, spacing and thinning young plants, methods of harvesting the beets, use of by-products, etc., are described in the bulletin. Copies of this bulletin may be obtained by addressing a request to Department of Agriculture, Washington, D. C.

TITAN 10-20

THIS practical favorite among tractors has long aided industriously in the cause of good American farming and it has gained as great a popularity across boundaries and oceans as well. Since the first Titan went out to the fields five years ago, the farming world has invested over seventy million dollars in Titan 10-20 Tractors. No other 3-plow tractor has approached such a record as this.

Titans at this writing are delivering reliable horse power at drawbar and belt for many thousands of owners who are done with uncertainties and who know that quality is but another name for economy.

Entering into 1921, this Company has effected arrangements which include provision for time payment and price reduction guarantees in the sale of its tractors. Prospective Titan owners will be glad to have the assurance of this benefit and safeguard during the present period of uncertainty. Details may be had by application to any International dealer or by letter from the address below.

Farmers who believe in the money value of high standards in agriculture, as this Company believes in manufacturing standards based on quality, will be helping to build higher the achievement of Titan in 1921.

With every Titan 10-20 Tractor purchased from us—cash or liberal terms—between now and May 1, 1921, we will give our written guarantee that if this Company reduces its price on Titan 10-20 Tractors on or before May 1, 1921, we will refund the purchaser the amount of such reduction.

MOSAIC POTATO DISEASE

In experiments carried on cooperatively between the bureau of plant industry, United States department of agriculture, and the Maine experiment station on the mosaic disease of potatoes, transmission of the potato mosaic was found to take place by means of tubers, grafting, the transfer of plant juice, and aphids under various conditions. Infection was also obtained with intervarietal transfer of juice. Transmission was attempted, but without success so far as could be ascertained in the same season, by means of flea beetles, Colorado potato beetles, the seed cutting knife, and contact of seed pieces, of roots, and of vines.

Preliminary observations are believed to indicate that infection does not result from growth in soil that produced mosaic plants the previous season. It seems impossible either for infected plants to recover, or if diseased stock is not far away and insect carriers exist to assure the maintenance of health of susceptible varieties by roguing plats or by selection of hills, tubers, or seed pieces. Isolation of plants by means of insect cages, as well as growing potatoes in greenhouses in which insects were excluded, maintained stocks free of disease. This is believed to indicate that the control of aphids and possibly some other kinds of insects is the most important means of checking the spread of potato mosaic among susceptible varieties.

Later the Maine station issued a bulletin from which we quote the following:

"Do not expect to control or reduce potato mosaic by means of sprays, seed treatment or soil treatment, except by spraying methods which control plant lice. Use as healthy stock as can be obtained. Plant at least part of it in a seed plot of sufficient size to furnish seed for the next year's planting. Select land for this purpose as remote from all other potato fields as possible and land which has not grown potatoes for one or more years. Give the seed plot special care. Rogue all mosaic plants from the seed plot as soon as they show the disease. In case aphids are unusually abundant the spreading of mosaic by them possibly would be reduced by controlling them with suitable spraying methods, which are advised for the seed plot every year, inasmuch as even a small and inconspicuous number of aphids may spread mosaic.

"Such spraying methods, according to recent publications upon this question, require adding ¾ pint of nicotine preparation to each 50 gallons of

Bordeaux mixture. In localities where it is feasible to make a separate spray for aphids the ¾ pint of nicotine solution is more effective if added to 50 gallons of water containing 2 pounds of laundry soap first dissolved in hot water. Moreover, if preferred, kerosene emulsion may be used instead of the nicotine spray. Regardless of whatever spray is used for plant lice it is essential that it be applied in such a manner that it reaches the insects themselves, since the effectiveness of the spray depends upon contact. Hence it is necessary to have the nozzles arranged on the spray boom so as to cover the under sides of the leaves and the stalks of the plants, as well as the upper leaf surfaces, with spray materials. Finally, avoid any chance of mixing the seed plot stock with the rest by harvesting and storing it separately from the general stock. Repeat this each year."

FARMERS MARKETING COMMITTEE ON THE GRAIN SITUATION

The Farmers Marketing Committee of Seventeen recommends that the system of handling the grain crop of our country to the best interests of the producers and the public include the following:

Farmer owned elevator companies and sales agencies to operate on the local and terminal markets of the United States.

Farmers export companies and sales agencies to operate on foreign markets for the purpose of handling the exportable surplus.

The grain growers of the United States should as soon as possible, by mutual contract or otherwise, arrange for the sale of all grain on the basis of cooperative bargaining.

That the foregoing shall be carried into effect with the ultimate view of the protection of the just rights of the producer and the orderly marketing of farm products.

The committee wishes to assure the grain producers of the country that it keenly appreciates the necessity of prompt action, and that as quickly as the necessary data can be gathered by its experts it will perfect and present a plan to carry the foregoing principles into effect with the cooperation of the various existing farmers organizations interested in grain marketing.

Resolution

Resolved, That we deem it morally wrong and highly detrimental to the interests of agriculture and the consumers to permit the practice now in vogue of selling grain, cotton and other farm products which the seller or his principal do not own at time of sale. This practice is commonly known as "short selling." Further, that we do petition congress to enact such legislation as will stop this practice at the earliest possible date.

RUST IS COSTLY

Farm implements either wear out, rust out or break. A break, as a rule, does not permanently disable the machine—a new part repairs the damage. A machine does not wear out for a long time unless rust is permitted to get in its deadly work. And rust is so easily prevented. A little good metal paint having rust inhibitive properties will do it. A small supply kept on every farm and used to touch up bare spots as fast as they appear would double the life of most farm machinery. It doesn't matter if the job isn't neatly done. Farm machinery isn't supposed to look pretty. It's the utility, the saving that should be considered.

THE KUDZU VINE

M. Calvino, near Havana, Cuba, has for several years been experimenting with growing this leguminous vine for fodder and recommends it for the warmer parts of the United States. It is easily propagated by seeds or by root cuttings and seems to agree with all manner of livestock, not alone in Cuba but in California and elsewhere. With us it makes almost a prodigious growth and thrives in all parts of the state.

HYATT
ROLLER BEARINGS

In 1921 Farm Work

IN 1921 on American farms, more than ever before, must it be made possible for one man to accomplish more work—for an acre to produce more crops.

High priced land and high priced labor are but two of the things that are making this necessary.

Labor-saving and time-saving farm machinery is going to help in a very large degree to solve this problem.

The use of Hyatt Roller Bearings in farm machinery makes for more dependable, more economical operation and longer life.

The manufacturer who builds Hyatt Bearings into his machines is one that can be looked upon as a quality builder, whose machines merit the full confidence of the American farmer.

Eighty Years of Rumely Experience Guards the OilPull User

For over eighty years power farming machinery bearing the Advance-Rumely mark has set a standard for honest construction and dependable operation.

This is demonstrated in the Rumely OilPull tractors. First made in 1909, OilPull tractors have back of them the accumulated manufacturing experience of these 80 years—experience that enabled the designers to start with a design of dependable, practical features.

And this design has not been fundamentally changed. You will find the same dependable features in the new product, oil burning, oil cooled, two cylinder heavy duty motor, spur gear transmission, straight membered frame—all features that have stood the test of over 12 years' field service. True, improvements have been made. Parts have been strengthened, the design has been refined, and season after season, the performance has steadily improved.

The result as seen today, is that an oil burning, oil cooled OilPull, as a real power farm unit, is equaled only by another OilPull.

There is a size for every farm—12-20, 16-30, 20-40 and 30-60 H. P.

We shall be glad to send printed matter describing these dependable features.

CUSHMAN

All-Purpose Farm Engines

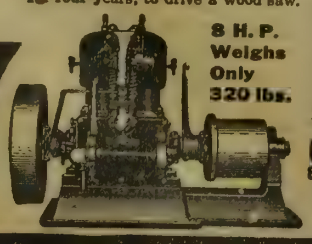
These are the original light weight all-purpose farm engines—sizes 4 to 20 H. P.

The Cushman 4 H. P. weighs only 190 lbs.—8 H. P. Double Cylinder only 320 lbs.—15 H. P. Double Cylinder only 780 lbs.—20 H. P. Double Cylinder only 1200 lbs.

Cushman Motors have extra equipment, such as Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump, without extra cost.

He Never "Choked" the Cushman

W. J. Kelley, McMinnville, Oreg., wrote: "I have operated an 8 H. P. Cushman for four years, to drive a wood saw. My saw is 32 inch 13-gauge Simonds saw. I have probably cut 8000 or 10000 cords of wood and I never got a stick that was too big or or too hard for the Cushman. It was only a matter of how much weight the feeding table would hold. It is a marvel of strength, with very little consumption of gas—from four to six gallons of distillate every ten hours."



8 H. P. Weighs Only 320 lbs.

When Writing Advertisers Mention California Cultivator

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pruning Avocados

I have noticed from time to time in your paper notes on the avocado, but so far I have not found anything on the training or framing of the tree. As I have some trees under my care which are growing out of balance and very woody, I would like to hear something about pruning them.—Unsigned.

Commercial growers prune only to keep trees in proper shape and balance. The aim is to keep them low and spreading rather than tall and columnar. As the fruits are heavy and on long stems, winds thresh them about and cause serious loss, therefore keep trees low. The avocado takes kindly to severe pruning so be unafraid of judicious heading and thinning.

Black Currant

Do you know of a variety of black currant that will fruit in the vicinity of Redlands?—Subscriber, Redlands.

We know of no such currant and believe there is none, either black or red, which fruits satisfactorily in the southern end of the state, especially in the warmer interior sections. If any subscriber has any information as to currant which will fruit well we will be glad indeed to pass on the word.

Sprays

May I ask a few questions about the care of a small family orchard? I have a few old peach trees that look as if they need some kind of winter spray. Would like to know what to use and how. Also have some apple trees and would like to know when and what to use to keep the worms out this coming season.—Subscriber, Redondo.

Without any knowledge as to what insects or fungus are infesting the trees, it is impossible to recommend any definite treatment. On the presumption that there might be San Jose scale we would recommend spray with strong solution of commercial lime-sulphur. A little later, just before blooming, they might be sprayed with Bordeaux mixture for the sake of preventing curl leaf. Sprays for apple trees would be later and will be more particularly given with formulas prior to spraying time. In a word, however, to keep the apples clear of codling moth they are sprayed about the time the petals are dropping and some three or four times later at intervals of two or three weeks.

Para-dichlorobenzine

We published early in December a short article touching upon a remedy for borers, known as "Para-dichlorobenzine." We soon began to receive requests for information as to where to get the material and phone messages to the larger drug houses met blankest ignorance as to what the stuff is. We wrote to the department of agriculture at Washington and from A. O. Quaintance, entomologist in charge of deciduous fruit investigations, have the information that there are three eastern concerns handling it, but apparently the material has not yet been distributed west of the Mississippi River. We may say, however, that the treatment consists in taking away the dirt to a depth of several inches and out a couple of feet from the trunk of the tree, spreading the dichlorobenzine in thin layer and covering with dirt. This destroys the larvae which may be in the soil. Where borers have already secured entrance to the trunk of the tree the same old treatment with wire or cutting out is the only successful one.

Olives Not Bearing

I have several olive trees about 14 or 15 years old that bloom very nicely every year but never fruit more than a few dozen per tree. What fruit could I bud them to that would give me something worth while?—Subscriber, Holtville.

Either the Mission or the Manzanillo bear well in most of the olive growing sections of California, but it is possible that the non-bearing of these trees is due to the weather conditions prevailing at time of blooming, that is, strong winds, especially the winds often called Northers, and charged with electricity, at blooming time mean practically no crop for olive trees that season.

Budding Mesquite Trees

Can any fruit be successfully budded on mesquite trees?—Subscriber, Holtville.

We fear there is nothing which can be successfully grafted on mesquite. However, some stockmen have utilized them as they are by gathering the beans and grinding. They make fairly good feed.

Pollinator for Kieffer

What is the best pear to interset with Kieffer as pollinator? It blossoms so exceptionally early that I do not know what to set with it, nearly all other varieties coming from one to three weeks later. — Subscriber, Banning.

We have from A. L. Wisker of Grass Valley the following answer:

"Forelle, by all means. Not only is Forelle our earliest bloomer among the European pears but it has the added advantage of bringing remarkably high prices at auction, half boxes this season selling for $8.37½ in New York. Kieffer blooms early on account of its Chinese blood."

E. A. Gammon of Sacramento writes in answer to the same question:

"No Kieffers have been grown commercially in this district. I have only one tree with Buerre Hardy and Bartlett surrounding it. It bears regularly."

Alfalfa Nurse Crop

What is the best way to sow alfalfa? How would it be to sow barley or oats and about a month later sow alfalfa?—Subscriber.

We take it the subscriber wishes to know as to the advisability of using barley or oats as a nurse crop with the alfalfa. Formerly, especially in sections subject to heavy frosts, the fall sowing of alfalfa was often made with barley as the nurse crop. This prevented some of the more serious frost injury in a severe winter but it was generally found that the first season's cutting was much less and the plants lacking in vigor. As a rule now the alfalfa is sown independent of any other crop.

Potato Dip

Regarding scab on potatoes and method of dipping would like to know what per cent of formaldehyde and how long should they be left in dip. Does just wetting do any good? We have good potato land but on our fall crops we have a big percentage of scab, even among those who dip. Our land is medium black loam. How does the future look on a spring crop for next year? Am going to plant 50 acres.—Subscriber, Strathmore.

Answering this and a similar question from a Montebello subscriber:

Dip in corrosive sublimate one ounce, water six gallons. Leave the potatoes in this solution one and one-half hours and use care in planting in disease free soil. If, however, you prefer the formaldehyde solution use at the rate of 16 ounces of 40 per cent formaldehyde to 30 gallons of water. As with the other dip one and one-half hours, but it has been found that if rhizoctonia are present it requires longer dipping and so potato growers have formed the habit of dipping a full two hours, which will catch both diseases. Four full dippings should be followed by dumping the solution and beginning with new again.

Spray for Peaches

Please give information as to spraying peach and apricot trees. — Subscriber, Montebello.

INVESTIGATE THE Martin P&G Co. DITCHER

Ditching Worries Ended

More Work at Less Expense

Two men, four horses, and a **Martin** will make a mile of new ditch, three feet deep, in less than a day. *Figure the saving!*

The Little TWISTER Write me Today!

YOU can have the handiest, most reliable belt power outfit that is built if you own a Ford or Dodge. BELT POWER TRANSMITTER is all that you need. Catalog free. Frank R. Welsgerber, Salina, Kansas.

As the inquiry comes at the time of the year when it is proper to spray for blight we refer the inquirer to article on page 787 of the issue of December 18. As it is already rather late for the peach blight, if that is the trouble, he should get busy very quickly with lime-sulphur or Bordeaux spray. The same spray should be used again a little later or just before blooming out time.

Fuller's Rose Beetle

Will you please tell me in the Cultivator what attacks these rose leaves; also some fruit tree leaves were the same way last fall but not quite so bad. Nearly all my rose leaves were eaten like sample last fall, but I could not see anything on them except a few green lice. The rose bushes are planted in the lawn and some in the flower garden. What is it that eats the leaves so nice and round and what should I spray with? — Subscriber, Lincoln.

This appears to be the work of Fuller's rose beetle, nearly half an inch in length, which eats these peculiarly shaped forms out of the edges of leaves. But worse than the leaf eating, its greatest destruction is in its underground form. It not only attacks roses but citrus and other trees. It is a poor flyer so it may be prevented from ascending the trunk by using Tanglefoot or other sticky substance around the trunk and keeping all branches pruned up and off the ground. A poison spray made of 4 pounds neutral lead arsenate to 50 gallons water will lessen the number of the pest.

Holes in Tree Trunks

My young almond trees have shot holes around the trunk of the tree where the limbs start to spread and on some a few rounds of the little holes up the limbs. Some are small and some look to be made bigger by something, and juice seems to leak out from the stem. The smaller trees are not affected but the large healthy trees are. Now is this caused from the outside of the tree by borers or birds or is it caused from the inside of the bark? I have used for a spray the formula from the Cultivator of chlorinated lime, one-fourth strength and later one-third strength. Now if I whitewash the trunks of the trees will that kill the borers or stop the birds from making the holes, if latter is the cause. On the young orange trees we have the bark tree protectors and above that a few trees have newly made holes which look to me as if made by birds, because there are no holes around as far as the tree protector was. The birds carried acorns to the trees and dropped some down the tree protector. How large is the borer? Is it a worm or a bug? —Subscriber, Lincoln.

It does not appear from the drawing and the description which the subscriber sends to be a case of borers, but of birds. In that case the damage will be but slight. If, however, the injury is from borers, a pocket knife will soon determine, or some prefer, instead of the pocket knife, a light wire which will follow the burrow and destroy the pest. In either case we do not think a spray would help in controlling the pest. If the injury is from birds it will be so slight that the good they will do the trees will amply compensate. The larva (worm like form) of the borer is half an inch to an inch in length and very sluggish.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Renewal of Lease

My lease on a piece of property expired November 1, 1920. I was not notified to vacate, in fact those interested in the property, which is an estate, told me that they would like to have me remain, but owing to a division of the property under the final distribution of the estate, the executor did not wish to make out another lease for another year. I have prepared for next year's grain crop and have bought seed. Will the last year's lease hold good and can they put me off the place or compel me to take a different lease from last year's?—Subscriber, Los Angeles.

If a lessee of real property remains in possession thereof after the expiration of the hiring and the lessor accepts rent from him, the parties are presumed to have renewed the hiring on the same terms and for the same time, not exceeding one month when the rent is payable monthly, and not in any case for more than one year. This provision of the law is a mere presumption of a renewal of the contract and it is possible that such presumption might successfully be rebutted. Especially, it would seem to be possible in the case of an executor who, by reason of a partition of the estate among other owners, did not wish to make a renewal of the lease. Your lease would, therefore, be subject to decision of a court as to whether or not there was a renewal. It will be noted that the provision requires, in order to establish a presumption, that the lessor should accept rent. If rent is accepted, the presumption would very probably be so strong as to be something upon which you can rely.

Alkali Land

I purchased an equity in land on representation that it is good farming land and that it would grow anything. I find that the alkali content is so high that it cannot be used for intensive farming, such as berries. What steps can I take to recover my money? Would the state real estate commissioner take cognizance of the case?—Subscriber, Los Angeles.

It might be well for you to communicate with the commissioner, who has an office in Los Angeles. Your action would either be for a rescission of the contract wherein you should tender to the vendor the land mentioned and demand the return of the purchase price thereof or you can retain the land and take action to recover the amount of damage which you have suffered. If you take the first option, your action would be one of equity before a judge; under the second action, it would be at law either before a judge or a jury, as you may desire. In either case, however, it would probably be necessary for you to consult an attorney.

Olographic Will

I have several brothers and sisters but desire to leave all my property to one sister. Will the following will be sufficient? "My last will and testament: I hereby give all my property which I own at the time of my death to my sister, ..., and wish her to act as administratrix of my estate. (Signed) ....." Would it be necessary to have a witness?—Subscriber, San Diego.

If the foregoing will is entirely written and signed in the handwriting of the testator it would probably be sufficient providing that the testator also places the full date of the will in his own handwriting. Such will is known as an olographic will and does not require to be witnessed.

Leasing to Japanese

Does the recent initiative measure regarding anti-alien ownership of land affect my leasing land to Japanese gardener?—Subscriber, Los Angeles.

The anti-alien act has no effect as between the private parties making the contract which can be enforced by either of those parties. The effect which it does have is that the state of California may bring action to cause the escheat of the interest of the alien in land. Upon judgment in such action, such interest possesed by the alien in the land may be sold and the proceeds given over unto the state.

SAME SENSATION

Al Klein: "Have you ever taken a tail spin in an aeroplane?"

Thompson: "No, but I've been called upon unexpectedly to make a speech, and I guess the sensation is about the same."

Household Department

FARMER JOHN

Home from his journey, Farmer John
  Arrived this morning safe and sound;
His black coat off, and his old clothes on,
"Now I'm myself," said Farmer John;
Up leaps the dog: "Get down, you pup!
Are you so glad you would eat me up?"
The old cow lows at the gate to greet
  him;
The horses prick up their ears to meet
  him.
"Well, well, old Bay!
  Ha, ha, old Gray!
Do you get good feed when I'm away?"

"You haven't a rib," says Farmer John;
  "The cattle are looking round and
  sleek;
The colt is going to be a roan,
And a beauty, too; how he has grown!
  We'll wean the calf in a week,"
Says Farmer John, "When I've been off,
To call you again about the trough,
And water you and pet you while you
  drink,
Is a greater comfort than you can think!"
  And he pats old Bay,
  And he slaps old Gray;
"Ah! this is the comfort of going away."

"For after all," says Farmer John,
  "The best of a journey is getting home;
I've seen great sights, but I would not
  give
This spot, and the peaceful life I live,
  For all their Paris and Rome;
These hills for the city's stifled air,
And big hotels and bustle and glare;
Land all houses and roads all stones,
That deafen your ears and batter your
  bones!
  Would you old Bay?
  Would you, old Gray?
That's what one gets by going away."

"I've found out this," says Farmer John,
  "That happiness is not bought and
  sold,
And clutched in a life of waste and hurry,
In nights of pleasure and days of worry,
  And wealth isn't all in gold,
Mortgage and stocks, and ten per cent,
But in simple ways and sweet content,
Few wants, pure hopes, and noble ends,
Some land to till, and a few good friends,
  Like you, old Bay,
  And you, old Gray,—
That's what I've learned by going away."

And a happy man is Farmer John—
  Oh, a rich and happy man is he.
He sees the peas and pumpkins growing,
The corn in tassel, the buckwheat
  blowing,
  And fruit on vine and tree;
The large kind oxen look their thanks,
As he rubs their foreheads and strokes
  their flanks;
The doves light round him, and strut and
  coo;
Says Farmer John, "I'll take you, too' "
  And you, old Bay,
  And you, old Gray,
Next time I travel so far away."
  —John Townsend Trowbridge.

HOW DICK SHOOK DOWN THE JAIL

By Samuel C. Appleby in Youth's Companion

"I'LL tell you what, Steve, if I had the money I would buy one share at least in the new factory," said Dick Rodman to his chum, Stephen Harris, as they walked home from school.

"Oh, I'm sick of hearing about that factory!" Steve answered. "The town is full of it. I have it for breakfast, dinner and supper. The teachers discussed it at recess today, and I really believe that that is what made the principal talk the way he did this morning—when he said that everyone ought to take an interest in things that were good for all. He took five shares himself in the factory at ten dollars a share. That's fifty of the schoolmaster's dollars."

"Did he? Well, that is what my father took, and you know he hasn't got any money to spare. It doesn't seem to me such a bad idea for a schoolboy to do the same if he could scrape up the money."

The progressive men of Silverthorn, the pretty waterside town, had determined to start a factory for making overalls and work shirts. They believed that it would be a good thing for the town, that it would cause money to circulate and give much employment—particularly to women and girls. Two years before they had put up a fruit crate shop, to utilize a convenient supply of gumwood. It was paying well; the workers spent their wages in the village stores or put them into the bank. It all helped to increase business.

Of the ten thousand dollars of capital stock that had been issued for the new factory, nearly all had been taken up. Everyone in town had a chance to buy the stock at ten dollars a share, and nearly everyone had availed himself of the opportunity. Col. Willard Smiley, the wealthiest man in the community, had bought one-half of the whole.

The great question was, Where was the factory to be situated?

One building in town would have suited entirely had it been deemed safe, but it leaned so far from the perpendicular that for years everyone had been expecting it to fall. It was nearly a hundred years old, but it had been strongly built, with immense beams of hewn oak supporting its two floors and its roof; and although the ancient brick walls had a decided tilt toward the south, they showed no sign of cracking.

This building, known as the old jail, had been used as a jail 75 years before; then the county had removed its seat of government from Silverthorn to Bellville, ten miles away, and had sold the structure. It had finally come into the hands of Col. Smiley, who had used it as a cannery when he started to make his fortune in packing vegetables. Later he had built a larger factory on the river front, and for five years the old building had been empty and deserted.

In spite of Steve's lack of interest in the factory project, Dick persuaded him, before he turned in at his gate, to accompany him that evening to the public meeting of the new factory directors.

The boys were at the hall promptly at eight o'clock, and a few minutes later Col. Smiley rose to address the meeting. After a few introductory remarks, he said:

"Gentlemen, if the old jail were as upright as everyone here is, it would be ideal for our purposes; but I should not be upright myself if I permitted machinery and heavy cases of goods to go into that building with the precious lives of the people who will work for us. In every other way the building admirably suits our purposes; moreover, the rent is low; three hundred dollars a year would give me a fair return on its value; but after conferring with contractors in the city I find that it would not pay me to tear it down and rebuild; and it would be too expensive to have it set level.

"This puts us into a rather awkward situation, for there is not another building in town suitable for the factory. To build a wooden structure would cost us, at the very lowest estimate, five thousand dollars, and we ought probably to figure on seven thousand. Though we could borrow most of that money from the bank, it would eat into our capital a little. Moreover, the yearly cost of such a building, in interest charges and taxes, would be five hundred dollars—two hundred dollars more than the rent of the old jail."

As Col. Smiley finished, Dick Rodman grasped Steve's knee so hard that it made his chum wince. "Steve," he whispered, "I want to tell you something as soon as we get out. I—I've got an idea."

The meeting was short, and the question of building a new structure was postponed so that all could think about it.

"What was it that came over you?" Steve asked when the two boys reached the sidewalk.

"Don't laugh at me, Steve," said Dick, "but I think I know just where that factory is to be situated."

"What do you mean?" asked Steve. "You're getting me interested in your old factory."

"Glad to see that," Dick replied, laughing. "You'll become still more interested when I put one hundred real dollars into your hands for helping me out—if—if—I can get them to give me the chance."

"What's your scheme?" asked Steve, curiously. "What are you going to do?"

"Nothing tonight," Dick answered. "Meet me tomorrow morning at seven o'clock at my gate. I want to show you the possibilities."

"Who in the world is that, snooping round the old jail this early in the morning? Come here, mother; see if you can make 'em out."

Col. Smiley was standing in the bay window of his dining room. The house stood on a slight rise, and from it across wide lawns he had a good view

The Cultivator Patterns

BE SURE TO SEND SIZE

3405. A Stylish Gown.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5½ yards of 36 inch material. The width of the skirt at lower edge with plaits extended is about two yards. Price 10 cents.

3409. Girl's Dress.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size will require 4¾ yards of 36 inch material. Price 10 cents.

3426. Work or Morning Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5⅝ yards of 36 inch material. The width of the skirt at the foot is about 1¾ yard. Price 10 cents.

3075. Child's Dress.—Cut in five sizes: 1, 2, 3, 4, and 5 years. Size 4 requires 2⅝ yards of 36 inch material. Price 10 cents.

3425-3419. A Pleasing Costume.—Waist 3425 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3419 cut in seven sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. The width of the skirt at lower edge is 1¾ yard. To make this costume for a medium size will require 5⅝ yards of 40 inch material. TWO separate patterns 10 cents FOR EACH pattern.

3431. Girl's Dress.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size will require 4¾ yards of 27 inch material. Price 10 cents.

3406. Ladies' Night Dress.—Cut in four sizes: Small, 32-34; medium, 36-38; large, 40-42; and extra large, 44-46 inches bust measure. A medium size will require 3½ yards of 36 inch material. Price 10 cents.

3103. Boy's Suit.—Cut in four sizes: 2, 3, 4 and 5 years. Size four will require 2⅝ yards of 40 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS: we guarantee safe dilivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator,
Los Angeles

of the old jail, an eighth of a mile away.

Mrs. Smiley ran to the window and peered out. "I do believe it's Dick Rodman," she said. "And there's another boy with him—Steve Harris, I guess. Those boys are inseparable. I wonder what they are doing?"

When the colonel sat down to his breakfast, his wife got a pair of field glasses from the library and returned to the window.

"What do you think, pa?" she exclaimed. "One of them is hammering something into the ground, and the other is up on the roof and sceems to be letting something down."

"Here, I've got to see that," said the colonel, going to the window. His wife handed him the glasses. "Humph! They've laid a lot of packages in a row on the ground. Now the boys are on their knees in front of the house, looking at something on the ground. What can they be doing?"

"You may be bound, pa, that Dick has some engineering idea in that head of his—and it's a good head, too. They say he's going to fit himself to be a civil engineer. You remember how he got Blade's schooner off the bar?"

"Indeed, I do remember. That day cost me money. The boat was out in the stream half a day, loaded with my goods, and all the canning house hands idle in consequence."

Meanwhile down at the old jail Steve, following Dick's directions, had been boring holes in the ground and in the hard packed earth floor of the basement, which was on a level with the ground itside along the walls. He put into separate packages samples of the earth that the auger brought up.

"What I want to find out," said Dick, "is exactly what kinds of earth the walls are resting upon. I think we'll find it a chalky white earth mixed with a little clay."

Steve's sneers at the new factory still rankled a little in Dick's mind, and he had determined to pay back his chum by keeping him somewhat in the dark about his scheme. As for Steve, he was now too much interested in Dick's mysterious plan to think of refusing to help unless Dick took him into his confidence.

While Steve was at work, Dick and gone to the roof. There he took out a thin fishing line at the end of which was a tiny plumb bob and lowered it over the edge of the roof on the front side, which had sunk the most. When the plumb bob touched the ground he made the line fast.

Returning to the ground, he planted under the plumb bob a heavy, flat plank about fifteen inches long, and on this he tacked a ruler in such a way that one end touched the wall of the building.

"Now, Steve," he said to his chum, who had come out to see what he was doing, "you can tell how far out of plumb the old jail is. One end of the ruler touches the house and the needle of our plumb line points to ten inches exactly."

"Ten inches out? No wonder people have been expecting it to fall."

"It isn't quite so bad as that, for the cornice juts out four inches. No, the outward hang of the wall is just six inches. The cornice makes it look more. Now let's get to school; this noon we'll go to see Col. Smiley."

(Continued next week.)

CARE OF CLOTHING

Sponging, cleaning and pressing make wearable many shabby garments.

Sponge garments with ammonia water to remove shine.

Steam velvets.

Use clothes hangers and cotton covers.

Wear shoes in turn; keep repaired; use shoe trees.

Reinforce new garments where wear will be the hardest.

Wear aprons when at work.

Have play clothes for children.

Secure buttons, fastenings, etc., on ready made garments.

Mend or darn all textiles before badly worn.

SIGNS

Gothamite: The East is more civilized than the West. You don't see New Yorkers wearing guns with notches.

Visitor: No, they run around with dents in their mud guards.—Life.

HINTS FROM HOUSEKEEPERS

My Favorite Cake and Pudding

These are the two recipes that I use more than any others.

Two Layer White Cake: One cup sugar creamed with one-third cup butter or lard, three-fourths cup sweet milk, one and one-half cups flour, one heaping teaspoon baking powder and whites of two eggs. Cream butter and sugar well, add the milk, then the flour that has been sifted with the baking powder, and beat until smooth, then add the stiffly beaten eggs and divide equally in two layers.

The yellows of the eggs may be used in

Velvet Pudding: One pint (two cups) sweet milk, two-thirds cup sugar, one tablespoon flour and the beaten yellows of the two eggs. Use a part of the milk and make a smooth paste of the flour, then mix all together and boil, stirring constantly until it thickens. This is a good pudding when flavored to suit the taste, or when used with coconut, chocolate or bananas.—Elizabeth A. Boswell, Clarksdale, Arizona.

Sweet Potato Custard Pie

In a recent number of your paper someone asked for recipe for sweet potato pie, made with a custard. Here is mine, called good: One pint sweet potato (put through sieve), one pint sweet milk heated to boiling point, one cup sugar, one level teaspoon flour, one egg, salt, nutmeg. Mix last five ingredients and stir into boiling milk and pulp. Pour into rich crust and bake until custard is set. Serve with spoonful of whipped cream on each portion.—Jay Esep.

HOUSEHOLD QUERIES

Birthday Candles

Could some kind reader of the Cultivator send me a recipe for a birthday cake which would take 27 candles; also tell me the saying as to the candles left burning after the three tries at blowing out. — Subscriber, Lompoc.

The very tiny candles we would suggest as giving the prettiest effect on a birthday cake and 27 could be crowded easily on a medium sized cake. If the subscriber wants to cut the cake in 27 good sized pieces, a candle to a piece, that's different. Can our readers help us out as to proper size and sayings? Dainty little rosebud candle holders for fastening to the cake can be purchased very cheaply at almost any general store. The recipe for two layer white cake given by Elizabeth Boswell in "Hints from Housekeepers" above we would recommend as a very nice birthday cake. If the recipe were doubled and the batter baked in large square pans it would make a large cake of good size for decorating with candles. A pretty idea is to have an extra candle in the center of the cake—a larger one—the "one to grow on."

Hulled Corn or Hominy

Please give formula for hulled corn or hominy.—Subscriber, Redlands.

Here are two recipes, one for lye and the other for soda hominy:

Lye Hominy: Select sound, white corn. To every gallon of corn use one tablespoon of concentrated lye. Cover the corn with water. Boil slowly until the skin comes off easily and the dark tips on the grains begin to come out. Wash thoroughly. Let soak (preferably over night) in cold water; drain; return to the kettle and boil in plenty of water until tender; put in a stone jar and set in a cool place and it will keep for several days. It may be canned and kept as long as desired.

Soda Hominy: Cover the corn with water. Add one tablespoon of baking soda for each cup of corn. Boil till hulls are softened and may be removed easily. Drain off the soda water and wash in cold water. Rub between the hands to remove any hulls. Wash repeatedly till all hulls are gone. Add boiling water to the corn and boil until thoroughly cooked.

8,000 Miles GUARANTEED Without Punctures or Blowouts

WRITE TODAY FOR FREE BOOKLET
Describing In Detail the Merits of the Dayton Airless Tire

Dayton Airless

They can't puncture—They can't blow out.

No pumping or patching or roadside repairs.

Ford, Maxwell and Chevrolet owners are getting 10,000, 15,000 and 20,000 miles of wear, in all kinds of service—on passenger cars and trucks—under all kinds of driving conditions.

Nothing can happen to Dayton Airless Tires but w-e-a-r. Nothing stops them until they are worn clear down to the last pier of rubber. Remember — without punctures or blow-outs.

Do you use 30 x 3, 30 x 3½, 31 x 4 tires? If you do, spend your money wisely — buy Dayton Airless. It's true economy.

The next time you drive around our way, STOP—AND LOOK THEM OVER.

STANDARD OIL COMPANY
(California)

BEAN RECIPES THAT ARE DIFFERENT

Here are some interesting bean recipes taken from the December number of the California Bean Growers Journal:

Bean Polenta

One pint small or large White beans, 1 teaspoon molasses, ¼ teaspoon mustard, 1 tablespoon vinegar, 1 tablespoon salt, ⅛ teaspoon pepper, 2 tablespoons drippings.

Cook the beans until the skins break. Press through a colander or mash. Return to the kettle. Add other ingredients in the order given. Cook ten minutes. Serve hot or when cold cut into squares, dip in flour or egg and crumbs. Saute in drippings. Serve with tomato sauce.

Kidney Bean Scallop

Pick over, wash and soak two cups Kidney beans over night. Cook until tender and drain. Then add 2 tablespoons fat, 1 tablespoon finely chopped onion. ¼ cup tomato pulp, 1 teaspoon salt and ⅛ teaspoon pepper. Mix well, turn into a greased baking dish and cover with 1½ cups bread crumbs mixed with 2 tablespoons melted butter. Bake ½ hour in moderate oven.

Stuffed Peppers with Beans

One pint cooked small or large White beans, ½ cup tomatoes, 1 small onion minced, ½ cup bread crumbs, 4 tablespoons finely minced bacon or fat meat, 2 hard cooked eggs chopped, green peppers.

Cut green peppers lengthwise, remove all the seeds. Mix the remaining ingredients well. Fill pepper cups with the mixture, sprinkle with buttered crumbs over tops, place in a shallow pan. Add sufficient boiling water to half cover the peppers, and bake in a moderate oven until they are tender.

Beans and Spaghetti

Fry six thin slices of bacon until crisp; remove from the fire and keep hot. Into the fat put six large tomatoes, peeled and cut in small pieces; 1½ teaspoons salt, 1 teaspoon sugar, ¼ teaspoon black pepper, a minced green pepper, a small onion shredded, and 2 cloves. Simmer, stirring until cooked and thick like a sauce. Then add a pint of cooked Lima beans and 3 cups of cooked spaghetti, both of which have been cooked in salted water. Let all get very hot, pour on a deep platter, garnish with the bacon and parsley and serve.

Baked Baby Lima Beans

Put to soak in warm water over night, 1 pint of Baby Lima beans. In morning drain off water and add fresh boiling water, 2 tablespoons salt and teaspoon soda. Let simmer slowly until beans are somewhat soft.

Drain and put into bean crock and season with one-third cup molasses and 1 teaspoon salt and ¾ teaspoon mustard.

Score a piece of fat salt pork (one-fourth pound) and bury it in the beans. Add boiling water to cover and bake slowly four or five hours, uncovering the last hour of baking to brown beans.

REMOVE FRUIT STAINS PROMPTLY

Fruit stains should always be removed as soon after they are made as is possible. If still moist, an application of boiling water will be sufficient in most cases.

Stretch the stained material over a bowl or pan and pour the boiling water on the stain, holding the teakettle two or three feet above the material so the water will strike the stain with considerable force. It may be necessary to rub the stained spot and to make several applications of the boiling water, especially if stain has been allowed to dry.

Peach stains and fruit stains whose coloring matter is red or purple are often set by soap, so they should always be removed before the article is washed.

For persistent stains use lemon juice and sunlight, a three per cent solution of salts of lemon or a ten per cent solution of acetic acid alternated with the boiling water. If acid is used the article must be very thoroughly rinsed to remove all traces of the acid or the material may be weakened.

Acid should never be applied to colored materials, as it will remove the color.

SERBS LEARN TO CAN

American Red Cross workers, while in Serbia, taught the housewives to preserve fruit and vegetables. The scope of this work was limited by the lack of cans and jars, but in spite of the scarcity of containers many Serbian menus will boast green peas, beans, tomatoes, asparagus and canned fruits with their bread and meat next winter. And once having tasted such delicacies out of season, there will in the future be a ready market for them.

The only fruit which the Serbs have made any attempt to preserve heretofore have been the plums, great quantities of which are grown and exported. These are known as Bosnian prunes and are noted for their excellence. A very good syrup called "pekmez" is made from these prunes, and before the war great quantities of it were shipped all over the world, especially to Austria and Germany.

QUIETNESS

The individuals and the organizations that accomplish most function smoothly and quietly.

A noisy, boisterous employe usually is a disturber. His loud and incessant talk interferes with the concentration and, therefore, the efficiency of others.

The right kind of quietness often betokens capability.

Gabbers frequently are shallow.

Have you ever reflected that many of the most powerful forces of nature operate silently?

Thunder booms with the noise of a thousand cannons, but it is the silent lightning which possesses power.

The sun, on which all life on this planet depends, operates without suggestion of noise.

Frost tightens its titanic grip or splits mountainous rocks without heralding its approach by suggestion of noise.

That mysterious thing which we call time keeps on the even tenor of its way as quietly as the motionless air.

The electric current, the modern miracle worker of miracle workers, indulges in no screeching.

It is only the surface of the sea that ever becomes tumultuous; the depths are as silent as the grave.

The idea that in order to win popularity it was necessary to be a jolly, rollicking "good fellow" is out of date.

The business world today does not want blusterers but workers.

World Beater

By Alfred M. Ghormley

ONCE more a seemingly unbeatable record has fallen, this time the world's yearly milk record, held so many years by Tilly Alcartra with a production of 33,425.3 pounds milk and 1,323.02 pounds butter in 365 days. This honor goes to Segis Pietertje Prospect, a Washington Holstein cow, owned and developed by the Carnation Stock Farms, Seattle, Washington, in whose hands she made her marvelous record of 37,380.1 pounds milk, 1,445.9 pounds butter in 365 days, having passed the record of Tilly Alcartra by approximately 4,000 pounds milk and 122 pounds butter.

Segis Pietertje Prospect, the new champion, is the highest exponent of those three great characteristics that all Holstein breeders are striving for, viz., good constructive breeding backed by individuality and production. "Prospect," as she is commonly known to her friends, was born April 10, 1913, on the farm of Geo. V. Leighton at Boise, Idaho. Mr. Leighton had acquired a very fine bunch of cattle in New York state, among which were King Segis 10th and Beauty Pietertje Clothilde, "Prospect's" sire and dam.

Details of Her Remarkable Test

She freshened on December 15, 1919, dropping a very fine bull calf sired by Dutchland Governor Sir Colantha, a son of Colantha Johanna Lad out of a daughter of Hengerveld De Kol. After freshening she came down with milk fever, but rallied quickly. She started on semi test December 18 and on official test on December 21, and made in her first seven days 686.4 pounds milk and 33.23 pounds butter, milking her high day 109.6 with an average test of 3.87 per cent. In January she was tested twice, making in her first two days, January 18-19, 212.3 pounds milk and 6.365 pounds fat. On retest she milked 226.2 pounds milk and 6.689 pounds fat. Her production for the month was 3,609.1 pounds milk testing 2.91 per cent and making 134.44 pounds butter.

During February she was again tested twice, making 234.4 pounds milk and 6.589 pounds fat the first time and 237.2 pounds milk and 7.076 pounds fat on retest. Her production for the 29 days was 3,360.1 pounds milk and 121.804 pounds butter. On her first test in March she made 235.3 pounds milk and 7.62 pounds fat. It was then decided to run her seven days again. This time she made her largest seven day milk record with a production of 858.9 pounds milk and 30.92 pounds butter in seven days, milking her high day 126.3 pounds. Her production for the month of March was 3,716 pounds milk and 137 pounds butter. This is her largest single month's work for milk.

In April she was again run for seven days, this time making the remarkable record of 808.6 pounds milk and 33.18 pounds butter, only .05 of butter behind her record made when fresh, and with an increased flow of 122.2 pounds in seven days. We believe this one of the most remarkable records she made, considering that it was done 120 days after calving. Her monthly production for April was 3,459.6 pounds milk and 140.97 pounds butter, her highest single month's fat production.

In May she was run on semi test, only making 214.1 pounds milk and 7.089 pounds fat in her two day period. Her monthly production was 3,367.1 pounds milk and 139.31 pounds butter.

She was run for seven days a fourth time in June, six months after calving, and made 743.1 pounds milk and 30.906 pounds butter, milking her highest day 111 pounds. As you check up these records you will note how consistent her production has been—never milking a startling amount for one day, but milking a remarkable flow at all times. This was the last time she was tested for seven days. Her production for June was 3,188.7 pounds milk and 131.135 pounds butter.

In September she was run two days, making 178.5 pounds milk and 5.49 pounds fat.

During October she was tested twice, once by Fred S. Martin, superintendent of official testing for the state, and her monthly production was 2,711.6 pounds milk and 104.725 pounds butter.

It was then decided to run the cow on official test her last 30 days in order that we might have one out of every four days of her test official work. Accordingly she was started officially on November 16 and continued until the end of her test. During November she produced 2,616.5 pounds milk and 98.12 pounds butter.

In December she was continued officially and at the end was tested under constant watch for 72 hours by Prof. F. I. Martin of Pullman and Prof. R. N. Coleman of Oregon Agricultural College. She completed her year at midnight, December 18, with the remarkable production of 37,380.1 pounds milk and 1,445.9 pounds butter. This gives her an average of daily production of 102.42 pounds milk, or 11.64 gallons, or 46.56 quarts, and a lead of 3,858.8 pounds of milk in one year over her nearest competitor.

ANOTHER BIG ONE IN THE MORRIS HERD

Miss Aaggie Acme Burke owned by A. W. Morris & Son has over 31 pounds butter first seven days on test. She is dam of the Baldwin $41,000 bull.

The World's Greatest
Segis Pietertje Prospect, producer of 37,380.1 pounds milk in one year.

GLENN COUNTY DUROC-JERSEY SALE

The Glenn County Duroc-Jersey Swine Breeders Association has made a change of date of its sale from January 25 to Monday, January 24.

For more gas engine power and economy this spring
–install the best piston rings now!

When a farm engine has wasted oil or gasoline, lost some of its power, or has had too many fouled spark plugs, carbon troubles, or repairs of this kind—the chances are that its piston rings are leaking. They are probably worn out—or imperfectly designed or made. Such an engine needs better piston rings if it is to give you complete satisfaction during your busy season.

Install the best piston rings now—while you have the time. Put a Supercyl Ring in the top groove of each piston to keep oil out of the combustion chamber. That will decrease carbon troubles and save lubricating oil. Put the real Leak-Proof Rings in all lower grooves. Their *equal radial pressure* keeps fuel from wasting past them. It is all compressed into power. Your dealer can sell you a size or over-size for every make and model of engine.

Always install the combination

McQuay-Norris Mfg. Co.

Cheap Protein

Cotton seed meal is proving much more attractive to the livestock feeder than it was with the prices which prevailed a year ago. One may now have a high quality product delivered in his home town for considerably under $50. In fact, it is now being used by some orchardists for fertilizer, but because of the oil content it is not as quickly assimilated by the soil as is the case after feeding. The requirements of the animal are for the fat as well as the protein so that if fed to the soil in the form of manure it is much more quickly available and double use is thus secured. For the livestock man there may be much of interest in the following quotation from "The Value of Cotton Seed Products in Feeding Animals," which treats of its value in supplying protein:

"Protein (or nitrogenous materials) is the name of a group of materials containing nitrogen. All other constituents of feeding stuffs, the ash, fat, and carbohydrates, are non-nitrogenous, or free from nitrogen. Protein materials are often designated as flesh formers, because they furnish the materials for the lean flesh; but they also enter largely into the composition of blood, skin, muscles, tendons, nerves, hair, horns, wool, and the casein and albumen of milk, etc. For the formation of these materials protein is absolutely indispensable. No substances free from nitrogen can be worked over into protein or fill the place of protein. It is then absolutely necessary for an animal to be provided with a certain amount of protein in order to grow or maintain existence. Under certain conditions it is believed protein may be a source of fat in the body; and finally it may be burned, like the carbohydrates and fat, yielding heat and energy.

"The sources of heat and energy in the animal, then, are the protein, fat and carbohydrates of the food and the fat and protein of the body, for the fat and protein of the body may be burned like that in the food. The value of the fat for producing heat is nearly two and a half times that of carbohydrates or protein. The sources of fat in the body are the fat, carbohydrates and, probably, the protein of the food; and the exclusive source of protein in the body is the protein in the food."

Henry's "Feeds and Feeding" says: "The cotton seed carires about 19 per cent fat, or oil, and nearly 20 per cent crude protein. Formerly much seed was fed in the South, especially to steers and dairy cattle. Now little is fed before the oil is extracted, both on account of the value of the oil and because cotton seed oil usually gives better results. At the oil mills the leathery hulls of the cotton seed, which are covered with short lint, are cut by machinery and the oily kernels set free. These kernels are crushed, heated, placed between cloths and subjected to hydraulic pressure to remove the oil. The residue is a hard, yellowish, board-like cake about one inch thick, one foot wide and two feet long. For the trade in the eastern and central states the cake is usually ground to a fine meal, for the western trade it is often broken into pieces of pea or nut size for cattle and coarsely ground for sheep, while the export cake is commonly left whole. Cotton seed is one of the richest of all feeds in protein and carries over eight per cent fat. The protein and fiber content vary considerably, depending chiefly on how thoroughly the hulls are removed from the meal.

Raising Standard by Selective Breeding

Raising the standard of farm animals and poultry and bringing out certain desirable characteristics by selective breeding is receiving more attention as methods of farming for profit become intensified.

The breeding of domestic animals dates back to remote antiquity, when the most advanced races of the Old World were still on the border line between savagery and barbarism. It far antedates any but the simplest mechanical arts. Yet while our knowledge of the laws of nature as they apply to machines has reached very great magnitude and complexity it is comparatively only a few years since the principles of breeding have been more than a collection of unrelated traditional beliefs.

Old Superstitions Still Current

The same superstitions on which the shepherds of Asia based their practices at least 30 centuries ago are still widely current, while the one sound principle known to the ancients, selection of the best for breeding stock, is still widely neglected.

The principles of successful animal breeding, as they have been learned by practical experience in the United States and older countries and by careful scientific study along definite lines, are outlined in Department Bulletin 905, recently issued by the United States department of agriculture.

This bulletin goes into the first principles of reproduction and follows the means by which certain characteristics of one or the other parent are transmitted to the offspring, the methods of selection best suited to intensify the desirable characteristics and weed out the undesirable, the characteristics which can with certainty be expected to continue from one generation to another, those which are uncertain, those which will blend and those which can not be inherited.

Aside from mere increase in numbers the purposes which the breeder is likely to have in mind fall under two more or less distinct heads, namely, production of a uniform product, and improvement. A uniform product depends on such control over the heredity of the stock that matings can be made with the assurance that the offspring will be of a certain definite type for which there is a demand. Improvement is, of course, closely related to control over heredity, but the methods which give the greatest control are not necessarily those which lead to the most rapid improvement.

A Basis for Selection

In a broad sense the whole subject of practical breeding comes under the head of selection. The most obvious basis for such selection is the performance of the animals themselves. Unfortunately, the merits of most kinds of livestock cannot be measured directly. The study of conformation as an index of useful qualities has accordingly held a high place as a basis for selection of breeding stock. Livestock judging has this for its purpose. An animal of good breeding is a better one to breed than one of equal individual merit but of mixed or common breeding. Pedigree, though often misused, is a valuable aid to selection, apart from following a general policy of mating. The soundest basis of all for selection of breeding stock is the record of past performance as a breeder, provided the record is sufficiently extensive to give a fair test.

The bulletin gives many valuable pointers on the selection of cattle for milk and butterfat production and for beef; the breeding of sheep for wool and mutton; of hogs for pork; and of poultry for eggs and meat.

It falls in line with the "Better Sires —Better Stock" movement of the department of agriculture, by which farmers are being encouraged to build up their flocks and herds rapidly through the selection of pure bred sires. The new bulletin, which contains 67 pages and numerous charts and illustrations, is entitled "Principles of Livestock Breeding." It may be obtained at the nominal cost of 15 cents from Superintendent of Documents, Government Printing Office, Washington, D. C.

BUFFALO HERDS INCREASE RAPIDLY

The American Bison Society reports that in January, 1920, there were 3,393 wild and tame buffalo in the United States. This encouraging report sets at rest the very real fear that existed not long ago lest the native buffalo, which once roamed the western plains, would soon become extinct.

Of the nine government owned herds, two of the largest under the care of the United States department of agriculture are located in the Wichita national game preserve, Oklahoma, and on the national bison range at Dixon, Montana. The herd on the Wichita preserve now numbers 154, including 28 calves of this year. In this herd four bulls and 12 cows are ten years of age or over and one cow is 29 years old. The 15 animals that constituted the original Wichita herd came from the New York Zoological Park.

In accordance with the provisions made by the 1919 appropriation bill for their care, it is planned this year to dispose of some of the surplus buffalo in the government herds. Public parks and municipalities are the largest patrons. By distributing the animals over the country, if disease or misfortune overtakes the main herds, there still will be stock left with which groups could be built up again.

The buffalo in the United States have increased about 300 per cent in 12 years. In 1908 there were 1,116 wild and tame buffalo in this country; at the beginning of 1920 there were 3,393. Canada has a large number—5,080. This is due to the fact that several years ago, when the Pablo herd in Montana, belonging to Michel Pablo, a half-breed Indian, was for sale, the Canadian government bought the animals, sufficient interest not being exhibited by Americans at that time to make it possible to retain them in this country. The total number of wild and tame buffalo on the North American continent at present is probably more than 9,000 head.

NOTABLE GATHERING OF HORSE AND ALLIED INTERESTS

Delegates from the four quarters of the United States and Canada gathered at the convention just closed at Chicago and listened to the reports of the annual budgets, elected officers and discussed ways and means for the improvement of the horse and allied interests. This annual meeting of the Horse Association of America was marked by an enthusiasm and attendance which has never before been equaled.

Aside from dry statistics, Mr. Dinsmore reported the thorough and searching investigations carried on all over the United States by the representatives of the Association. The keynote of his talk was that the Horse Association is not dealing with theories but facts, hard, irrefragible facts, sought out, checked and verified, and the association is today prepared to furnish accurate data to all who are interested in costs of teaming, riding and driving.

The California Producers and Shippers Transportation Association has been organized. Its first act will be to petition the shipping board to investigate conditions and take action toward readjustment of overland rates. Market Director Daniels is aiding in the work.

State Dairy Cow Competition

IN ACCORDANCE with announcement made, the California State Dairy Cow Competition, conducted by the college of agriculture, University of California, under the direction of Prof. F. W. Woll, opened September 1, this year, and will be continued for 17 months, closing January 31, 1922. The competition is a part of the campaign of the college for better cows and for better returns from the dairies of the state than are now realized by most farmers.

Cows producing over 50 pounds of butter fat during November are:

Johanna Heng. Cap., 65.74; Naomi NaD DeK, 57.06; Jean NaD DeK, 56.71; Holsteins belonging to Dean Beeman, Woodland.

Financial C's LorD, 82.23; Figge's Loretta, 58.59; Bonnie's Financial LorD, 66.80; Jerseys belonging to Bonnikson Bros., Ferndale.

Beauty, 51.97; Miriam, 60.83; grade Holsteins belonging to Albert Burger, El Centro.

Yama Princess, 69.07, Holstein belonging to Burr Farm, Los Angeles.

Olga Smith Fern, 61.03; Noble's Saida Polo, 67.80; Jerseys belonging to J. W. Coppini, Ferndale.

Ciruela Mecht. Pont., 56.27; Venetta Mecht. DeK P., 64.85; Ciruela Mecht. Col., 52.47; Holsteins belonging to R. H. Davis, Modesto.

Squaw Queen DeK., 71.75; Sarcastic Dora, 58.65; Holsteins belonging to M. J. and B. A. Edwards, Ripon.

Minnesota, 55.57; grade Jersey belonging to C. E. Fisher, Hughson

Maud, 61.24; Rose, 81; Spencer, 50.69; Tom, 74.4; Mousie, 73.19; Spot, 66.14; Jersey, 63.04; Peg, 51.53; mixed grades belonging to Earl Graham, Compton.

Cynthia's Ral., 52.07; Raleigh Echo G., 61.21; Marion Fancy, 55.19; Cynthia of D. V., 76.03; Jerseys belonging to H. G. Gross, Eureka.

Blue Bell, 70.09; Beauty Homestead, 57.63; Domino, 84.34; Princess, 83.06; Solano, 57.01; Madera, 53.96; Sunland P. T. Korn., 72.88; Whittier Segis P. M., 64.14; Betty Lincoln S. P., 54.04; grade Holsteins belonging to L. A. County Farm, Hondo.

No. 65, 64.0; No. 2064, 51.7; No. 2065, 60.6; No. 1010, 59.1; No. 1492, 57.9; No. 1946, 67.8; No. 2150, 51.6 No. 2616, 50.3; grade Holsteins belonging to F. F. Pellissier, Whittier.

All told there were 77 cows which during one of the three months of September, October and November produced over 50 pounds of fat. The list above includes, however, only those which produced above the 50 pounds during the month of November.

The highest production was that of the grade Shorthorn Rose, owned by Earl Graham of Compton, viz., 2,099 pounds of milk and 113.3 pounds of butter fat (test, 5.4 per cent). A pure bred Holstein and another grade also produced over 100 pounds fat. Other records came as follows: Between 70 and 80 pounds, 20; between 80 and 90 pounds, 9; and between 90 and 100 pounds, 3.

The records made by competition cows during the past three months are most creditable and show the high quality of the cows in many California dairy herds. Summaries for the three months given are as follows:

	No. of Cows	Avg. Production, Lbs. Milk	Butterfat
September, 1920..	43	1340	56.63
October, 1920.....	92	1290	54.06
November, 1920..	100	1293	50.03

The following dairy farmers have entered cows in the competition, most of them during the past month: Adamson Corporation, Van Nuys; Arden Dairy, El Monte; R. E. Babcock, Arlington; N. L. Browning, Hemet; J. M. Christen, Pacheco; W. R. Elliott, Riverside; John J. Kelly, Santa Ana; Guy H. Miller, Modesto; Napa State Hospital, Imola; Santa Anita Rancho, Santa Anita; J. E. Thorp, Lockeford; and Winsor Ranch, San Diego.

COUNTESS PRUE, NEW GUERNSEY CHAMPION

A new world's champion record of production for the Guernsey breed has been completed by Countess Prue, owned by F. L. Howes of Massachusetts. On November 29 she completed her year's work of 18,626.9 pounds of milk and 1,103.28 pounds of butter fat. Five other Guernsey cows have produced more than 1,000 pounds of butter fat, but Countess Prue is the first Guernsey cow to exceed 1,100 pounds of butter fat. The previous world's champion Guernsey cow was Murne Cowan 19597, whose record was 24,008.0 pounds of milk and 1,098.18 pounds of butter fat.

Countess Prue merits the fame which is hers for she is a great cow in type, individuality and breeding. It is not often that we have such a combination in one individual, although one should see her to really appreciate these facts. Her pictures indicate balance throughout, from the standpoint of individuality. She is large, weighing about 1,300 pounds, has splendid spring of rib, depth through body and heart, and breedy head, with the generous muzzle and nostrils that go with large digestive and lung capacity. She has good lines and an udder of excellent shape. One of her outstanding characteristics is her quality throughout, quality in hide, bone and the texture of the udder. She is a combination of refinement and strength, of beauty and utility. Not once while on test did she miss a feed through indisposition, and at the end is as full of vigor and as keen in appetite as at the beginning.

A study of the pedigree of this wonderful cow reveals the fact that she has an inherited right to her individuality, and that she is not in any way the sport of a mediocre family. Her sire, Bell-founder, has come to the attention of Guernsey breeders during the past year through the records made by his daughters. He has at present 16 daughters in the Advanced Register list whose 20 records average 12,627.72 pounds of milk and 642.26 pounds of butter fat.

It is interesting to note that of these 20 records, completed by the 16 daughters of Bell-founder, one is over 1,100 pounds, one in the nine hundreds, one in the eight hundreds, three in the seven hundreds, four in the six hundreds, seven in the five hundreds, and only three under 500, the least being 418.78 pounds of butter fat. Countess Prue has a previous record made in class B of 13,172.9 pounds of milk and 709.21 pounds of butter fat.

The new world's champion was born December 20, 1912. She has two daughters, Prudence of Falcon's Flight, sired by a grandson of Imp. May Rose King, and Duchess Prue of Riverdale, sired by Cottina's Goldseeker of A. D. F. Duchess Prue of Riverdale was born just previous to the beginning of this epoch making record.

MILK LUNCHES IN THE SCHOOLS

There has been going on quite largely through the schools of the state of Indiana an educational campaign for a larger use of milk and butter. In a great many instances this work is being taken up by the cities and the schools in a very systematic way. They are encouraging in some way the use of milk in connection with their school lunches, and this work not only results in the use of more milk, but each child who consumes this milk forms the basis of a demonstration to their families which will certainly show that milk is the proper food for growing children. An illustration of how effective this work is becoming is shown by the work that is being done in Indianapolis. Last winter a School Lunch Association was organized as a result of a demonstration that had been previously conducted in a number of schools. This association has worked out a plan of financing their work, and in cooperation with the school authorities a school lunch director has been appointed and is now at work. This director reports that the milk lunch is being used as the basis of her work. She reports that during the second week which this lunch was in progress, milk was served in 69 schools to 16,000 children; 71,938 half pints of milk were used during the week, and of this number 694 were served free of cost to needy children and 1,671 additional half pints were served for part payment by the children. The remainder of the milk and the remainder of the lunch were all paid for by the children themselves. This is certainly an excellent piece of work. Equally as good results are being obtained in many other cities of the United States, all of which contribute to the stability of the dairy business.

DIAMOND BAR SALE

When Bob Walker took charge of the Durocs at the Diamond Bar Ranch he culled the herd until it began to look as though there wouldn't be many left. What were retained were real ones, though, and for the big sale on February 16 he has chosen many of the best ones of the picked lot. Bob is a mighty good judge of hogs and he wants to sell something that will make good for the purchaser.

The sows and gilts selected for the sale include three by old Pathfinder, two by Orion Sensation, a littermate to the world's grand champion, Great Orion Sensation, eight by Mammoth Sensation Jr., four by Great Pathfinder, the Putman boar of Tecumseh, Nebraska, one of these gilts being out of Model Maud, the $6,000 first prize senior yearling sow of the 1919 National Swine Show; others by High Pathfinder, Great Model, Creator, and one show gilt by Ace of Pathfinders. This one is Cherry Duchess 2d, the first prize and reserve junior champion gilt at the Los Angeles Livestock Show last fall. She will be bred to Diamond Sensation, a good son of Great Orion Sensation, that the Diamond Bar Ranch is growing out as a herd boar prospect. Being out of a Pathfinder dam, he makes an exceptionally well bred boar to cross on gilts sired by Ace of Pathfinders and Mammoth Sensation Jr.

SWINE REGISTERED LAST YEAR

Geo. A. Stingle, a Berkshire man of El Monte, has secured from the National Swine Growers Association figures as to the number of hogs registered during last year. Quoting from his letter from the association:

"The number of hogs recorded as reported to us by the several asso-

McCracken's Dispersal Sale
OF
Big Type Poland China Sows and Gilts
Ripon, Cal., Monday, Jan. 24th, 1920

I will sell 30 bred sows and gilts, the tops out of 200 head. Sired by the leading boars of the breed, such as Caldwell's Big Bob, Surprise Prospect, Giant Bob, etc.

Mostly bred to King's Big Bone Leader, Grand Champion at Sacramento in 1918 and sire of the 1920 champion. King's Big Bone Leader as well as Waukeen Prospect, the $1,100 gilt and three of her fall boars will be in the sale. Write for information and arrange to attend.

Les McCracken **Ripon, Cal.**

POSTPONED SALE
—OF—
POLAND CHINA HOGS
At Orland, Cal., Wed. Jan. 5th, 1921

On account of weather conditions, I have postponed my sale until January 5th, at which time I will offer 60 head, including 30 spring gilts, 10 fall yearlings, 10 tried sows and a few young boars sired by Long Jumbo, Yates Big Orphan, Glenn Chief, Young Hadley and bred to Yates Big Jones, Y. C. 4, Reformer and Black Bob. Write for catalog.

R. J. Yates **Orland, Cal.**

LENDORRIS RANCH
Big Type Polands

We are offering a number of fine gilts by Lendorris Liberty Bond bred to Lendorris Liberator—a half-brother to the grand champion of this year's National Swine Show—for March litters.

W. L. Haag and Son, Hanford, Cal.

Sows and Gilts---GET ONE

Bred to farrow next two months. We are making an extremely low price on these to reduce our herd. At the price we won't keep them long. Write today. Quick before they are all gone.

H. P. Slocum, Willows, Cal.

clations for the calendar year for Duroc-Jerseys, Poland Chinas, Berkshires, Hampshires and Chester Whites is as follows: Durocs, 159,111; Polands, 150,870; Berkshires, 19,970; Hampshires, 63,980; Chesters, 32,793.

FALFADALE FARM SALE

The decision of B. H. Wilkinson, manager of the hog department of Falfadale Farm, to change his place of employment to the Sierra Vista Ranch, owned by Cash & Kyne, has caused the Falfadale owner to make a complete dispersal sale of the big herd of Durocs he has been keeping. On February 17 everything is to be offered for sale at the farm near Perris. There will be 40 bred sows and gilts of Grand Model and Winsor's Giant Orion breeding. These will be bred to Great Orion Sensation, junior grand champion at Tulare, Los Angeles and Riverside, and a son of the world's champion boar, Great Orion Sensation. Then there will be a number of the grand champion's sons and daughters of late spring and fall farrow.

The big feature of the sale will be the great boar himself. He will walk into the ring and whatever Colonel Bell can get for him will be his price. It is a big chance to take on so valuable an animal, but the owners want to settle up the business and that is the most satisfactory way to do it.

STATE RECORD HOLSTEIN AT SANTA ANITA

Anoakia Walker Pontiac, one of the fine daughters of Prince Gelsche Walker in the big herd at Santa Anita Rancho, has just finished a seven days record of 27.33 pounds butter from 455.6 pounds milk as a senior two year old. This record is a few tenths of a pound higher than the record held by the Gotshall and Magruder heifer and gives the Santa Anita youngster the record for the state. Anoakia Walker Pontiac is out of Molly Woodcrest Pontiac, a former state record cow in the same class. May Altonia Pontiac, the dam of Anoakia Gelsche Pontiac Walker, the 27 pound three year old, has just finished a record of 34.87 pounds butter from 567.6 pounds milk.

The Santa Anita herd includes some exceptionally fine stock and under the care of E. J. Sturgis and James Adams they are making excellent records.

FARM SLAUGHTERING

Meat clubs and simplifying and cheapening the effort to secure a proper meat supply for the farm, without contributing unduly to the profiteer, has become a serious problem in many sections. To meet the need of information along this line the department of agriculture has issued and is now mailing "Farm Slaughtering and Use of Lamb and Mutton." In the preface is suggested:

The production of sheep for wool alone is rapidly on the wane in the United States. More and more emphasis is being placed on the production of lamb and mutton for the table. The future success of this industry will depend upon a strong, steady market, based upon an increasing consumption.

Only 3.9 per cent of the meat consumed by the average American for the last five years was lamb or mutton. This proportion should be much larger, as mutton and lamb are among the most healthful, nutritious, and palatable of meats.

The ease with which sheep and lambs are slaughtered on the farm and the comparatively small size of the carcass make them a most convenient form of fresh meat for family use and for summer killing. The meat can also be cured for future use.

This bulletin contains a discussion of the methods employed in slaughtering the animal, cutting up the carcass and curing the flesh; also recipes for cooking the meat.

DOCKING AND CASTRATING LAMBS

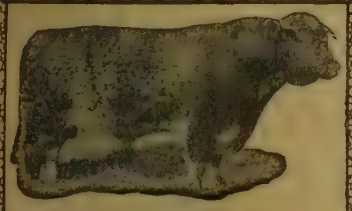
Docking and castrating of lambs when they are between ten and 20 days of age is recommended by W. F. LaGrange of the North Dakota agricultural college. The tail should be cut about one inch from the body with a docking chisel, shears or knife. A three-fourths inch board with a hole in it for the lamb's tail to pass through is convenient. A blunt chisel or tin shears may be heated to a cherry red, and the cutting performed slowly to sear the blood vessels and prevent bleeding.

To castrate, as in docking, a helper should grasp the two right legs of the lamb in one hand and the two left legs in the other. With a sharp, disinfected knife, the operator cuts off the bottom third of the scrotum or bag, then gently forces the testicles out. With the knife he cuts the peritoneum, which is the membrane covering the testicle. It is then pulled out with the cord. Hands and tools should be disinfected before operating. A mild disinfectant can be used to wash off the parts operated on.

Yuba County proposes to give work to its idle on the highways.

The number of farms in the twelfth federal reserve district, including the states of Arizona, California, Idaho, Nevada, Oregon, Utah and Washington, is 60,997 more than last year, an increase of 24 per cent. The increase in the entire United States was 1.4 per cent.

CALEDONIA SHORTHORNS



Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

The Healthy Cow, the Hungry Cow is the Business Cow

She's the cow that will convert her feed of grain and fodder, into pails of milk.

Remember, the better the appetite, the greater the food consumption, the greater the milk production. Hence, good health, a strong appetite and good digestion are the absolute essentials of a big milker.

Dr. Hess Stock Tonic
Keeps Cows Healthy It Makes Cows Hungry

It contains Nux Vomica, that greatest of all nerve tonics. It whets the appetite, brightens the eye and invigorates the system. It contains Quassia, that bitter stomachic tonic that produces appetite. It contains Iron that helps to replenish rich red blood, so essential to a cow in milk.

Lastly, but just as important is it—it contains Laxatives and Diuretics, that cause the kidneys to filtrate and the bowels to operate regularly, so as to throw off and carry off the waste material. There is no clogging of the system where Dr. Hess Stock Tonic is fed.

Good alike for cattle, horses, hogs and sheep. It keeps animals healthy, the whole herd thrifty. It expels worms. Always condition your cows for calving with a course of Dr. Hess Stock Tonic before freshing.

Dr. Hess Stock Tonic is compounded strictly on scientific lines. You buy it according to the size of your herd. Tell your dealer how many cows you have. He has a package to suit. We guarantee good results in the milk pail.

25 lb. Pail, $3.50 100 lb. Drum, $12.00
Smaller packages in proportion.

The Victory Herd of Holsteins
Holsteins of known value, headed by Sir Piebe De Kol Segis Pontiac, a son of King Segis Pontiac Count, acknowledged one of the breed's greatest sires, and our junior herd sire, King Pontiac Alcartra Prilly, whose dam made 36.61 lbs. butter out of 805 lbs. milk in 7 days, now on yearly test. A young bull from this herd is a profitable investment.

"A Wonderful Herd"

That is the phrase most often heard from breeders who have visited the outstanding herd of registered Holsteins developed by Jas. J. Jeffries.

It is a matter of keen regret throughout western Holstein circles that Mr. Jeffries feels that he must sell this great herd, owing to the demand for his entire time and attention made by his oil and mining interests. The herd will be absolutely dispersed.

Thursday, February 3, 1921
Jeffries Ranch, Burbank, Cal.

The offering is noteworthy in more ways than one, some of the features among the individuals which total

65 Registered Holstein Cows
Heifers and Bulls

being: The highest 7 days record cow ever sold in California; the highest yearly record cow ever sold in California; the wonderful Grand Champion 2 year old K. S. P. J. Pet Segis and her full brother; all of the sensational show animals that featured the Jeffries exhibit at Los Angeles in 1920; a wonderful uniformity of type throughout the herd; a large number of 29 pound cows; a number of great cows and heifers making splendid yearly records; AND KING SEGIS PONTIAC JANNEK, the sire of outstanding type, and his first daughters in milk indicate great production as well.

In short this is an offering that should attract the buyer of the very best, for it is given to few breeders to develop a herd of equal merit in so short a time, or to be so fortunate in the outcome of their first herd sire.

BREEDERS, don't wait until sale day to form your companies to buy KING SEGIS PONTIAC JANNEK. Decide the matter with your neighbors or associates well in advance of sale day, and rest assured that someone is going to take home from this sale possibly the greatest proven sire that has ever been sold at public sale in the West.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer, except as announced in the sale ring.

Catalog free on request. Write for one.

ABSOLUTE DISPERSAL SALE

66 REGISTERED HOLSTEINS 66

Rhoades and Rhoades New Sale Pavilion
Hynes, Cal.

Saturday, February 5, 1921

This is a closing out sale of the herd owned by W. A. Thompson, Holtville, California, and contains a particularly well bred lot of cattle, mostly young. Included in the list are daughters of such sires as King Mead of Riverside, Prince Gelsche Walker, King Morco Alcartra, King Pontiac Ruby Burke, Arcula Alcartra Sir Korndyke, Juliana King of Rock, and others.

The sale list includes a considerable number of young daughters of King Morco Alcartra, Jr., who is by King Morco Alcartra, son of Tilly Alcartra, and out of Aaggie Acme Burke, a daughter of Segis Pontiac De Kol Burke and the great foundation cow Aaggie Acme of Riverside.

The cows in the sale are substantially bred and include those with official records up to over 27 lbs. butter in 7 days.

Professor R. F. Miller, acting head of the animal husbandry department of the college of agriculture, is engaged in perfecting plans for the annual stockmen's week to be held at the university farm, Davis, the last week in February. A feature of the week will be the holding of several sales of registered livestock under the auspices of the different state breed associations.

At the annual meeting of the Orland Jersey Cattle Club M. Fortini was elected president; Kirby Clark, vice president, and W. H. Gurnett, secretary. The club expects to promote a number of calf clubs during the coming year.

Thirteen boys who are members of the Houston district school pig club have issued a challenge to all the grammar school pig clubs in San Joaquin County to participate in a feeding contest to extend 120 days.

F. W. Kiesel, Sacramento, owner of the Jane Garden herd of Holsteins, reports the following new records made under the direction of Harry L. Redd: Mansell Korndyke Francis, a senior three year old daughter of Adventurer Lad and Uneeda Korndyke Francis, 34.10 pounds butter from 484.2 pounds milk in seven days. This record is the third highest in class for California. Her dam, Uneeda Korndyke Francis, has recently completed a seven day record of 26.9 pounds of butter from 690 pounds of milk. Rest Easy Pontiac Veeman, a senior four year old, has to her credit 29.21 pounds of butter from 439.4 pounds milk in seven days, her average test being 5.29. Jane Garden Viola De Kol, a junior two year old daughter of Sir Aaggie De Kol Acme and the 25 pound cow Meadow Holland Nudine, has made 19.13 pounds from 446.5 pounds of milk. A large number of Jane Garden cows are to be tested during the next few months and Herdsman Redd is confident that in the lot are several that have great possibilities.

The annual sale of Shorthorns held under the auspices of California Shorthorn Breeders Association will take place at the university farm, Davis, February 22, during stockmen's week. The offering will be drawn from most of the prominent herds of the state.

The annual meeting of the Nevada Livestock Association will be held at Reno January 7 and 8.

The state department of agriculture and the California Cattlemen's Association are proposing legislation to make possible the inspection of all meat and meat products offered for sale in this state. At the present time the only form of inspection operating in California is that provided by the United States department of agriculture for meat prepared for interstate shipment, and by certain cities having local regulations.

Thursday, February 3, is the date announced by A. B. Humphrey, Escalon, for his sale of high class Berkshires from the Grapewild herd. He will sell 30 selected sows and gilts and possibly a few choice boars. This sale following that of the Italian Vineyard Company sale at Guasti on February 1, will give buyers an excellent opportunity to attend both sales.

J. G. Throckmorton, Sebastopol, had a few more Berkshire sows than the crowd could take at his recent sale. He reports the sale of a sow to Geo. Turner, Sebastopol, for $100 and the sale of two gilts to Mrs. Livingston, Oakland, for $155 and $200 each. This just about closes out the entire herd. Mr. Throckmorton has expressed himself as highly pleased with the prices received.

The dispersal sale of Poland China hogs by Les McCracken, Ripon, will close out one of the largest herds of Poland Chinas in the West. The sale offering will be the tops of about 200 head of sows and gilts. Among these will be the $1,100 gilt Waukeen Prospect. The 1918 grand champion boar King's Big Bone Leader will also be sold at this time and it is to be hoped that a boar with the prestige and standing this boar carries will go to head some good herd.

Guy H. Miller of Modesto has sold his junior herd sire, Wanda's Altama Interest, to Mrs. B. F. Williams of Sebastopol, Sonoma County. This is one of the most promising young Jersey bulls in California. He is richly bred and is a show bull as well, having been a prize winner at 1919 and 1920 fairs. He is sired by Altama Interest, one of California's most noted show bulls, and sire of 15 daughters and one son in the Register of Merit. The dam of Wanda's Altama Interest is Wanda of Venadera. Wanda has a Register of Merit record of 531 pounds of fat in a year at ten years old. She has four daughters in the Register of Merit, has been first prize and senior champion winner at the state fair. She is now nearly 15 years old, is entered in the state dairy cow competition and made 50 pounds of fat last month.

Guy H. Miller of Modesto reports the recently completed yearly test of the two year old Jersey heifer, Eloise of Venadera. For the year she gave 6,166 pounds of milk, average test 5.80 per cent, making 358 pounds of butter fat. Eloise is sired by the sire, Altama Interest, and is his fifteenth daughter to qualify for the Register of Merit.

The Jersey cow Hecla's Margery in the herd of D. F. Conant at Modesto has recently finished a yearly Register of Merit test, making 591 pounds of butter fat. Her sire is Foxy Underwood and her dam Foxy Hecla, a granddaughter of Champion Flying Fox. Lady Kate's Rosette, another Jersey in the Conant herd, has finished test, making for the year 583 pounds of fat. Rosette is sired by Mr. Conant's former herd sire, Pansy's Gertie's Lad, and her dam is Victor's Lady Kate, a daughter of the famous Connecticut bull, Lady Letty's Victor, sire of 29 cows in the Register of Merit. The cow Lambert Glory's Pearl, another of the Rancho Santa Marguerita herd owned by Mr. Conant, has qualified for the Register of Merit with a yearly test of 511 pounds of fat. She is also sired by Foxy Underwood and is his second daughter to enter Register of Merit with a test of over 500 pounds of fat in a year. Foxy Underwood was bred by Guy H. Miller and was selected from Venadera herd when a calf by Mr. Conant as his first herd sire. He is sired by Margery Goldens Fox, his dam, Pearl of Venadera, test 702 pounds of fat in a year.

The Jersey cow The Owls Nymph, bred by L. V. Walkley of Southing ton, Connecticut, brought to California by G. O. Hillier and now owned by D. F. Conant, has qualified for Register of Merit by making a yearly record of 507 pounds of fat. Nymph is a granddaughter of the famous bull Spermfield Owl, sire of 49 in Register of Merit.

W. L. Boldt of Escalon has purchased of D. F. Conant a yearling Jersey bull sired by Goldie's Altama Interest, out of Belle's Goldie of R. S. M., a daughter of Pansy's Gertie's Lad and a granddaughter of Victor's Lady Kate, the great foundation cow in Mr. Conant's herd. Mr. Boldt is laying a good foundation in starting a registered herd of Jerseys.

Richer Cream

A SOURCE of profit which is often not fully realized is in the ordinary wastes, for instance, skimmilk. Many dairymen have realized the value of this by-product and are provided with separators, but even then fail in getting full return. This, in part, because of being content with separating on a 20 or 25 per cent basis. The De Lavals are sending out a little pamphlet touching upon some of the advantages of richer cream and from it we quote:

There are four important factors which will enable the farmer to produce a better quality of cream: cleanliness in producing and handling the the cream; control of temperature on the farm and in transporting cream to the market; frequent delivery of cream to the market, and richness of cream.

All the above factors are very important for improving the quality of cream. Many creamery patrons firmly believe that sour cream tests higher than sweet cream and give that as their reason for not producing sweet cream. This is a mistake because the sourness of cream has no appreciable effect upon the butter fat content and does not show a higher test.

Richness of cream has a direct bearing upon the other three factors and, since all progressive cream patrons have a centrifugal cream separator, it is quite important that the creamery management insist upon rich cream or cream testing between 30 and 45 per cent butter fat. Rich cream means better quality of cream for four important reasons.

Why Rich Cream Is Best

Rich cream does not sour as quickly as thin cream.

Rich cream means a smaller amount to be taken care of, hence it is likely to be more thoroughly cooled and receive better care.

Rich cream can be pasteurized in the creamery with less loss of butter fat in the buttermilk.

Rich cream permits of the use of a larger amount of good starter.

Other Advantages of Heavier Cream

In addition to making it possible to produce better butter and hence give a higher price to the patron, rich cream has other very decided economic advantages over thin cream.

For instance, it means that more skimmilk is retained on the farm for feeding purposes; the cost for transportation is materially less, the benefit of which falls directly upon the patron.

When the creamery receives both milk and sweet cream, the cream patron should receive more per pound for the butter fat he delivers than should the milk patron because there is always a certain amount of butter fat left in the skimmilk, and this, of course, does not reach the cream vat. For every 100 pounds of butter fat delivered to the creamery in the form of whole milk only 97 pounds reaches the cream vat. whereas in the case of cream, all of the butter fat delivered reaches the cream vat. The loss will, of course, vary more or less, but the above amount, or three per cent, is, according to Professor Farrington, about the average.

Loss in Skimming Thin Cream

A proportionate loss to the creamery occurs in the case of the patrons who deliver 20, 25, 30 and 35 per cent cream against the patron who delivers 40 per cent cream.

Indeed the relative difference will be even greater, because the loss of butter fat in the buttermilk is almost invariably greater than the loss of butter fat in skimmilk, because thin cream gives a larger amount of buttermilk than does cream testing between 30 and 45 per cent of butter fat.

Take for example milk testing 3.5 per cent and five lots of cream testing 20, 25, 30, 35 and 40 per cent, respectively. How will the loss compare?

It will take: 2,857 pounds milk testing 3.5 per cent to equal 100 pounds butter fat; 500 pounds cream testing 20 per cent to equal 100 pounds butter fat; 400 pounds cream testing 25 per cent to equal 100 pounds butter fat; 333.33 pounds cream testing 30 per cent to equal 100 pounds butter fat; 284.64 pounds cream testing 35 per cent to equal 100 pounds butter fat; 250 pounds cream testing 40 per cent to equal 100 pounds buter fat.

Under normal conditions 85 per cent of the whole milk is skimmilk and ten per cent is buttermilk.

If the average per cent fat in the skimmilk is .1 per cent and in the buttermilk .3 per cent, then the total fat loss in 3.5 per cent milk delivered will be 3.28 pounds, leaving 96.72 pounds of butter fat. Again quoting Professors Farrington and Woll's "Testing Milk and Its Products," 22nd edition, page 192: "Certain mechanical losses are unavoidable in the creamery, as in all other factory operations, viz., milk and cream remaining in vats and separators, butter sticking to walls of churns, etc. These losses have been found to average three per cent of the total fat in the milk handled under normal conditions and under good management." This will leave only 93.72 pounds of butter fat available for butter. Taking the legal standard 80 per cent butter fat in butter, the largest amount of butter that can be manufactured from this would be 117.15 pounds, or an overrun of 17.15 per cent.

C. D. Hayworth of Modesto reports the recently completed Register of Merit test of the four year old Jersey cow Goldie of Rico Vegas, bred and owned in Mr. Hayworth's herd. For the year she made 574 pounds of fat and, like other cows of Stanislaus Jersey breeders, was fed and milked twice daily while on test. She has made an excellent record for a heifer with second calf. Goldie is sired by Lorna's Altama Interest, sire of nine young cows in Register of Merit.

One million acres of waste forest land in the United States is today producing nothing of value. This area, greater than the combined forest areas of Germany, France, Belgium, Holland, Spain, Portugal, Denmark and Switzerland, could be made into splendid productive forests.

Guernsey Females

Our herd reduction sale still continues and there is a lot of fine Imported and A. R. cows with high production records and show ring honors left to be sold. We are also offering the choicest lot of young stock ever in one herd in the West. A number of bulls of all ages from the above sired by King of Hollow-Hill and Effie's King.

Also 30 head of females 15/16 Guernsey that will make wonderful family cows.

All T. B. tested and guaranteed breeders.

Everything Priced Reasonably.

54 Registered Guernsey Cows, Heifers and Bulls

THE COWS—Are mostly imported, representing some of the richest breeding of the breed, and including daughters of Governor of the Chene, Raymond of the Preel XIII, Robert's Secret, and other sires of most fashionable pedigree.

THE HEIFERS—A very large percentage of the female offering is made up of heifers ranging in age from calves up to bred heifers, many out of imported dams and by such sires as Itchen Daisy May King of Langwater, Imp. Ricardo of Edgemoor, Auricle's Cherub of Edgemoor, and other sires of most desirable breeding. These heifers present a most excellent opportunity to secure foundation females of excellent breeding.

THE BULLS—Never before has the public been offered an opportunity like this, in California, for the purchase of registered Guernsey bulls, and breeders and dairymen alike should find selections to meet their requirements here. The bulls range in age from calves up to service age, and include several sons of Itchen Daisy May King of Langwater, whose splendid breeding and individuality commanded the then world's record price for a bull of the breed, $8,000.00 when he came to head the Revada herd.

Every animal is positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer, except as announced in the sale ring.

REVADA HERD was established some years ago by Mr. B. E. Nixon, who spared neither trouble nor expense in securing the foundation animals. Both the ranch and herd are now owned by Mission Land & Cattle Co., who have other plans in mind for the ranch and are making an absolute dispersal of the Guernsey herd in this sale.

REVADA RANCH is located nine miles north of Napa, California. Sale headquarters will be at Palace Hotel, Napa, from which point arrangements will be made for transportation on morning of sale for those who come in by train. SALE BEGINS PROMPTLY AT 10 A. M.

A FEW GRADE GUERNSEYS WILL SELL THE SAME DAY

Catalog of sale free on request to management.

FARM INVENTORY INDEX TO FINANCIAL PROGRESS

What is the net worth of your farm business Is it more or less than one would imagine from a casual inspection of your farm? Do you know for sure whether you are going or coming in financial standing?

These are important questions to the farmer and questions that are not so easily answered as would at first appear. Farming is an intricate business and one in which returns from investment are sometimes long delayed, so that progress can not be accurately measured by the amount of money taken in in a given time. Sometimes cash income may be almost wholly attributable to reduction in other assets, so that in reality the result is like taking money from one pocket and putting it in another.

The farm inventory, or property list, offers the only practicable way of answering these questions. Once the farmer has made a complete list of all his assets and liabilities and has balanced them he knows just what his net worth is, and when he has made such a list annually he knows each year whether he has gone forward or back and just how much has been the increase or decrease in the net worth of his business.

The United States department of agriculture has just issued Farmers' Bulletin 1182, entitled "Farm Inventories," in which are given detailed instructions for making an inventory of farm property and revising such a list from year to year. By using the simple system described in this bulletin any farmer can determine exactly his financial status and lay the foundation for a permanent system of accounting. Without the farm inventory as a basis no system of accounting that might be chosen would be of any great use to the farmer.

THE COST OF SUCCESS

The road to success is no rougher, or harder, or more painful than the road to failure, but there is a difference. We voluntarily choose to bear the pains of success, while the pains of failure are thrust upon us.

The pains of success are mental and physical, as are those of failure.

The boy or girl who aspires to success in school pays a daily penalty in the act of resisting the impulses to enjoy the pleasures of the moment; in forcing the brain to exercise when it is crying to quit; in doing daily mental tasks which are just as tiring as any physical labor.

The man who succeeds pays his penalty too.

He must save when he would like to spend.

He must work when he would like to loaf.

He must be up and doing when he would like to sleep.

He must take kicks and not kick back.

He must assume responsibilities when he dislikes to add to his burden.

He must be patient when his nature is to be impatient.

He must bring his appetite to reason when it calls to be unreasonable.

All of us know men who want to succeed, but we know they cannot because they will not pay the daily penalty.

It is, of course, as certain as the rising of the sun that they will pay the penalties of failure; they cannot avoid them, although they think they can.

The penalties of success are suffered for the most part in early years. —David Gibson in Tractor Farming.

TREATMENT FOR SCALY BARK

Treatment for trees affected with psorosis or scaly bark and gummosis has been outlined at the University of California college of agriculture following results obtained from experiments at the citrus experiment station.

Scrape the bark over and surrounding the diseased areas, giving particular attention to the advancing edges of the diseased lesion, and apply Bordeaux paste or other suitable fungicide. Badly affected limbs may be pruned out when practicable.

Discovery that the lemon brown rot fungus was responsible for the most severe types of citrus gummosis and was able to enter the bark under conditions of excessive moisture in the soil has led to simple treatment in preventing one of the most destructive diseases of citrus trees, according to Professor Fawcett.

Dry and well aerated soil immediately at the base of the tree is the simple remedy for the disease, it is stated.

AVOID ALKALINE WATERS IN SPRAYING

Avoid alkaline or hard waters in spraying orchards with acid lead arsenate. Instances are not infrequent of severe burning in apple, pear or prune orchards where this type of lead arsenate is used. Foggy or showery weather at the time of spray may also cause a similar burning. Under these conditions it is better to use the basic form of arsenate of lead.

SUGAR BEETS IN AFRICA

A recent issue of the Semaphore Algerien states that the government general of Algeria has acquired a large quantity of sugar beet seed from France, intending to encourage the cultivation of sugar beets.

Concrete Roads and Safety First

You're safe on concrete—whether the surface is wet or dry, whether you are running in "high" or "low," uphill or down, on the straight-away or around a curve—the even, gritty surface of the Concrete pavement makes you sure of car control.

You can depend on the Concrete Road—no other type gives so sure a grip for your tires, with so little tractive resistance. That's just ***one*** reason why you see Concrete Roads everywhere. It's not a sudden impulse. It's the crystallization of public opinion formed over a long period of time.

We have a booklet which tells about many other good features of Concrete Roads and how they pay for themselves. Simply ask our nearest office to send you a copy.

Market Your Grain in Egg Cases

Grain prices are low—egg prices are high. The great item of cost in egg production is feed—so the more *cheap grain* you turn into *high-priced eggs*, the bigger your profits.

You have the feed and the hens. Now work this profitable combination to the limit. Give your birds a varied ration—feed it freely—get eggs NOW—beat the grain market—cash in on the high-level egg market. And you'll be doubly sure of a big egg "harvest" by mixing

Pratts Poultry Regulator

with the feed. This great poultry tonic and conditioner quickly puts hens in laying condition and offsets the strain of heavy laying so they keep on shelling out the eggs. It supplies many needed things lacking in the winter feed—keeps the egg-making machinery working steadily and effectively. It enables you to "market your grain in egg cases," to your great advantage.

Expert poultrymen who make a specialty of this hen business and study it carefully find Pratts Poultry Regulator a big help. That's why they're spending their money for it. You'll find every dollar paid for Pratts Poultry Regulator giving big returns in increased egg production.

"Your Money Back if YOU Are Not Satisfied"

The Way to Begin

By Jean A. Koethen

HERE is a letter of the sort we always expect to receive about this time. I had hoped to answer it before it came, but lack of space prevented:

"Can you tell me where I can get information about how to build chicken coops, and what are the best kind of chickens for a novice? I expect to try the chicken business this spring and hope you can tell me the best way to go at it and where I can get the best books on poultry raising."

If this inquirer read in the Cultivator of December 11 the account of R. C. Gibson's work with poultry, he has already found out one good way to go at it. Mr. Gibson first read everything he could get his hands on, not periodicals merely, for they are necessarily fragmentary in their treatment, but the best scientific books he could buy. He did not delay beginning, however, till he had finished his reading, for precept and practice must go hand in hand. At the proper season he began raising chicks which he purchased from reliable breeders — White Leghorns, which are proving popular and satisfactory in large commercial plants. That year he raised 225 pullets, which means that he bought at least 700 chicks, for it takes three baby chicks to make one full grown pullet, and in the fall he began trapnesting those pullets to find the ones that were worth while as foundation stock.

Now, I am not counselling this inquirer to do just what Mr. Gibson did. Mr. Gibson knew something about the chicken business before he started his plant. This writer says he is a novice, and I do not know just what that means. If it means that he has never raised chickens at all, he will find his work cut out for him if he raises 100 pullets the first season. If he has never cared for a good sized hatch in a brooder I am not sure that he will want to try this first year. Twenty good big R. I. Reds or Buff Orpington hens will raise his flock for him and do a better job than he can. Let him set two hens at a time on 15 eggs each. If they come off with ten chicks apiece—and they ought to do better—he can buy 20 chicks more and let each hen have her quota of 20. Sitting only once in a season his 20 hens will thus care for 400 chicks, and most of them will sit twice. This is more trouble than raising 500 chicks at one time under one big hover, but both losses and cost of equipment are less, and when his hens have finished their work as mothers they can be sold for about what they cost.

If he prefers artificial brooding he will need to build his brooder house before his chicks are to be delivered. If he elects hens for brooders he will need an A-coop or a clean, rain tight box for each one, with a portable wire run to attach to the front of it. He might, if he prefers, build his brooder house and let the hens use it this first spring. He can divide it into runs with two foot wire, but he will also have to provide some means of egress for each separate brood.

He will have to have a place ready for the chicks when the hen leaves them, and his simplest course will be to take them at once to the laying house. When the cockerels are broiler size they go to market and this leaves room for the pullets.

Plans for brooder and laying houses are found in the Cultivator book, "Poultry for Profit," or may be had free from the poultry division of our own college of agriculture at Berkeley if they are not out of print. The laying house recommended by the poultry division is unnecessarily complex for a beginner. A simple shed roof house, with open front to the south or east, 6 to 7 feet high in front and 5 to 5½ feet at the back, 16 feet deep and 20 feet long, is sufficient, but he should not attempt to build till he has visited other poultrymen and studied their houses. Nearly every one has his own pet plan, and most of them are good, though some are more expensive than others. On page 498 of the Cultivator of October 9 is an article describing several types of laying house, but it is hardly wise to build an elaborate house till one is sure he will stay with the game. Certain houses seem fitted to certain localities, and for this reason it is safest to look around and see what your neighbors are doing.

Two books which should be in every poultryman's library are Harry R. Lewis' Progressive Poultry Husbandry, published by Lippincott's, and Professor Dryden's new book on Poultry Breeding and Management. I do not remember the publisher, but it will be found in the public library of almost any good sized town. One of the best things a novice can do is to take the correspondence course in poultry husbandry which is offered by the poultry division at Berkeley. You can begin at any time. I think the fee is $5, but it may be free, as it was formerly. You can find out by writing to College of Agriculture, Berkeley. Then you should, of course, join the poultry association in your own neighborhood. One learns a great deal by attending the meetings of these associations and hearing what other poultrymen have to say, and there isn't one of them who won't be glad to help you over a hard place if you ask him. Poultrymen are a cordial, friendly lot, and always glad to give others the benefit of their experience.

Poultry Queries

Conducted by J. A. Koethen

Sudden Deaths

We are anxious to know what is the cause of our pullets' dying. Frequently we find a nice, healthy looking pullet dead in the morning. It is first in one pen, then in another. It must be something in the feed, and yet we can't find out what it is. They have good laying mash before them all the time, greens at noon, grain at night, equal parts wheat, milo, oats and barley.—Subscriber, Long Beach.

It is impossible to explain these sudden deaths without a post mortem, and not always with one. Sometimes there are symptoms which might have been noticed had the caretaker been watching, a darkened comb, rough plumage, lassitude, lack of appetite. In other cases there is nothing external, but an enlarged liver or fatty condition round the heart is revealed on opening the carcass. More often than not a too concentrated diet, with lack of exercise and green feed, is the underlying cause of such deaths. In absence of more certain knowledge it can certainly do no harm for you to make the mash more bulky by adding an equal amount of bran, to feed twice as much green feed as you are now giving, and to feed the grain in such a way that your hens will have to work for it.

Enlarged Liver

We are losing some of our hens and would be thankful for information as to cause and cure. Some of them mope around a day or two and drop dead on the roost at night; others hang on for several weeks, eating fairly well but gradually growing lighter and weaker. I find those that die immedaitely have a liver enlarged to five or six times its natural size.—S. T. R., Lodi.

The reply to Long Beach subscriber above will probably meet your need as well as hers. That enlarged liver shows that your hens are getting too little green feed and too little exercise. The cure is more exercise, more green feed and a lighter ration generally. Feed less grain and add bran to the mash. Bicarbonate of soda in the drinking water is a corrective in these cases. Allow 1 to 2 grains per day for each bird. Dandelion leaves are particularly good for liver trouble, and the sliced roots of the plants may be steeped in water and mixed with the morning mash as a tonic. Be sure that your hens are not overcrowded. If you can give them a little range it will be a help.

Danger From Sprays

I have a large number of birds running in an orange grove which is

about to be sprayed with a solution of lime and sulphur, Triumph and glue. Is there anything in this that could possibly poison them? The poultry department of the Cultivator receives my first attention when the magazine comes, and I receive many helpful hints from it. — Subscriber, Strathmore.

There is nothing in lime, sulphur or glue that can harm the hens, at least in such an amount as they could get from a spray. What the preparation you call "Triumph" contains I do not know. The label should tell. If it does not, ask the manufacturer. Anything poisonous to human beings is poisonous to chickens. Arsenic and copper are the poisons most generally used in such sprays. If they are carefully used there is not much danger, but it would be well to find out exactly what the spray does contain and see that none is thrown on the ground or left standing in vessels where the birds can get at it.

California Farm Bureau Egg Laying Contest

By J. E. Dougherty

Nowhere in the country, we believe, can there be found a more comfortable, commodious, carefully designed, up-to-date and health and comfort promoting poultry laying house than the house especially designed and built for this contest. It is a full monitor type of house extending north and south. It is practically 300 feet long, 26 feet wide, with 6 feet side walls and with a 6 foot alleyway down the center and pens on each side. The pens are 10 feet by 16 feet in size and each pen contains 3 entries of 12 hens each so that the floor space per hen is 4½ square feet. These 36 hens are provided with 18 trapnests. In addition to a liberal supply of windows in the full monitor top and in the east and west walls, the whole interior of the house is whitewashed so that every part is exceptionally well lighted. The ventilation system is of special design and keeps the air pure and free from odors during the dampest weather. At the south end of the contest building are the office, exhibition hall and rest room, feed room and egg room. At the other end are the hospital and sand and straw storage.

Since November 1 the electric lights have been turned on at 4:30 a. m. and off at daylight. In the morning the birds are fed equal parts of cracked corn, wheat, milo and barley in a deep straw litter and a dry mash consisting of 240 pounds mill run, 180 pounds brown middlings, 180 pounds ground oats, 100 pounds soybean meal, 60 pounds fishscrap, 60 pounds meatscrap, 30 pounds charcoal and 4 pounds fine salt, is always before the fowls in self feeding hoppers. The first feed of finely chopped greens is fed in green feed hoppers soon after breakfast and the fowls are given all the greens they will eat during the day. At noon as much moist mash is fed as the birds will eat during the day. At noon as much moist mash is fed as the birds will clean up in 15 minutes, using the dry mash formula given above. At 3 p. m. as much sprouted oats with root sprouts one-fourth inch long is fed in troughs as the birds will consume in 15 minutes and at about 4:30 p. m. the night feeding is given of the same scratch grain mixture as is fed in the morning.

Pen Records for November

All birds are S. C. White Leghorns except six pens noted.

W. A. Ford, Umatilla, Oregon, 188 eggs; Geo. Gray, Santa Cruz, 179; D. B. Walls, Petaluma, 75; Alex. Steward, Santa Cruz, 113 2/3; Ed. Crewdson, Santa Cruz, 127 2/3; Bellows Bros., Lakeside, 119 2/3; D. B. Walls, Petaluma, 45; W. J. Neef, Santa Cruz, 179; La Rita Poultry Farm, Santa Cruz, 181; S. L. Gibson, Santa Cruz, 121 1/3; J. A. Hanson, Corvallis, Oregon, 197 1/3; Sea Breeze Farm, Capitola, 76 1/3; H. Beernick, Lyndon, Washington, 91; Ed. Buttler, Berkeley, 59; Boehm & Noel, Haywards, 21; Santa Barbara Poultry Ranch, 131 2/3; W. Wood, Santa Cruz, 143 2/3; H. Struve, Watsonville, 140 2/3; E. Credson, Santa Cruz, 156 2/3; C. E. Hyde, Santa Cruz, 142 2/3; Oregon Agricultural College, 60 2/3; P. Lehrbach, Los Angeles, S. C. R. I. Whites, 13; Mrs. H. C. Kleinsmith, Hoff, Oregon, S. C. Barred Rocks, 120; Oregon Agricultural College, S. C. Barred Rocks, 22; S. L. Gibson, Santa Cruz, Brown Leghorns, 72; S. L. Gibson, Santa Cruz, S. C. Brown Leghorns, 79; S. L. Gibson, Santa Cruz, S. C. White Leghorns, 159; Hampton & Loucks, Van Nuys, 76; Geo. G. Parker, Santa Cruz, 134; S. L. Gibson, Santa Cruz, 187; N. C. Westerfield, Modesto, 104 2/3; Hollywood Farm, Hollywood, Washington, 220 2/3; Sea Breeze Farm, Capitola, 84 2/3; Enterprise Poultry Ranch, Chino, 54 1/3; D. B. Walls, Petaluma, 52 1/3; Ed. Crewdson, Santa Cruz, 59 1/3; Fuller & McCallister, Inglewood, 14; Geo. Wood, Santa Cruz, 73; N. S. Kaime, Santa Barbara, 73; E. H. Schlink, Ramona, 15 1-3; La Rita Poultry Farm, Santa Cruz, 151 1/3; C. K. Hale, Santa Cruz, 161 1/3; C. N. Bolfing, Gilroy, 56 1/3; E. L. Spacher, Santa Cruz, 214 1/3; Chas. Lehman, Santa Cruz, 123 1/3; G. C. Brenneke, Santa Cruz, 103 2/3; W. J. Neef, Santa Cruz, 192 2/3; R. J. Kentor, Santa Cruz, 179 2/3; W. Wood, Santa Cruz, 203; Forster Bros., Berkeley, 110; Geo. Wood, Santa Cruz, 191; W. H. Marshall, Santa Cruz, 172 1/3; A. M. Webb, Santa Cruz, 99 1/3; J. S. Conrado, Santa Cruz, 180 1-3.

Fractions caused by dividing floor eggs equally between three entries in each pen.

Highest Individual Hens

Hollywood Farm, 25, 24, 24, 25 eggs; E. L. Spacher, 24 eggs, 25; Charles Lehmann, 24 eggs; W. J. Neef, 24 eggs. In addition 13 others laid 23 eggs, 21 laid 22 eggs, 33 laid 21 eggs and 46 laid 20 eggs each during November. 121 hens out of a total of 648 entered in the contest, or approximately 19 per cent of the flock, laid 20 eggs or better during this month.

In closing this report the attention of poultry breeders is called to the fact that the next contest will begin October 1, 1921, and not November 1. Lay your plans now for the production of that pen of wonder layers that is going to help in making the 1921-22 California farm bureau egg laying contest even better than the present one, for "Progress" is the watchword of the poultry industry and egg laying contests have become the milestones on the road of steadily increasing egg production.

WHY GET EXCITED

"Some tornado that was we had around here last night. Do any damage to your new barn?"

"Dunno. Hain't found the durn thing yet."—Cottonyarns.

UNTO ETERNITY

They were looking down into the depths of the Grand Canyon.

"Do you know," asked the guide, "that it took millions and millions of years for this great abyss to be carved out?"

"Well, well," ejaculated the traveler. "I never knew this was a government job!"

The National League of Commission Merchants will meet in St. Louis, January 12-14.

GERMOZONE

"the Best Remedy for Poultry and Pet Stock"

The old reliable, proven remedy for Roup, Colds, Canker, Swelled Head, Bowel Trouble, Snuffles, Wounds, Sores, Loss of Fur or Feathers, Skin Disease, Etc.

H. A. Kiewert, 5042 N. Long Ave., Chicago, Ill., says: "I had some of the worst kind of cases of roup in my chickens and I thought I would not save any but I have saved these birds, thanks to Germozone." H. A. Haines, Rosalia, Kas.: "If we had tried Germozone at first it would have saved us $1,000 worth of expensive experiments." Mrs. T. A. Morley, Gallen, Mich.: "Have used Germozone 17 years and could not get along without it." E. W. Thiel, Waukesha, Wis.: "I have used your Germozone for white diarrhoea in baby chicks and sure got wonderful results. I also use it right along on grown fowls."

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages, from Omaha. Poultry Book and Book on Diseases FREE.

Tomatoes: Local lugs, mostly 85@1.25 lug; best high as 1.50.
Turnips: Per doz., 25@35; sk., 1.10@1.35.

DECIDUOUS FRUITS

These are the actual prices obtained January 4, by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk.
Apples: Supplies liberal, movement slow, market steady. Californias: Bushel boxes Bellefleurs, fancy, 4 tier mostly 1.90@2.00; 4½ tier 1.65@1.75; Jonathans fancy, 2.75@3.25; Delicious fancy 3.25@3.50. Rome Beauty, fy., 2.50@3.25. Idahos and Utahs: Loose Jonathans and Winesaps mostly 6@7 per lb.; Ganos and Ben Davis mostly 5@5½ per lb. Oregon and Washingtons: Bushel boxes, extra fancy Jonathans and Spitzenburgs mostly 3.00@3.25.
Bananas: Lb., 10½@11.
Cranberries: Bbl., Late Howe, 21.00@22.00; Oregon, bx., 6.00.
Grapes: Emperor, Cornichon, 9@11; poorer low as 7, best high as 16.
Pears: Various varieties, 7@11.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.00@2.50; special packed brands, 2.75@3.50.
Lemons: Market dull, wide range in prices: Local stock: Packed, box, 1.25@2.00, few high as 2.75; loose, 1.00@1.25; lug mostly 40@50.
Oranges: Supplies heavy, market dull. Navels, special brands mostly 3.00@4.00 according to size and quality, grove run 85@1.50 loose. Tangerines, best, 9 lb.

HONEY

Movement slow: Carloads f. o. b. usual terms: Per lb. 5-gallon cans White Orange and White Sage, 16½@20; extra Light Amber Orange, and Sage, 19; Light Amber Orange, 18½; Light Amber Sage, 12@18½; Light Amber Alfalfa, 11@17. Beeswax: Sacked, in less than car lots 40@42 per lb. Prices given represent quotations; practically no sales being made. Wide range due to extremely unsettled market conditions; low prices are considered possible in near future.

NUTS

California Walnut Growers' Association announces prices on 1920 walnuts: No. 1, soft shell, 12½; No. 2, 18½; Budded, 25½; standard budded, 22½ per lb.

GRAIN AND FEEDS

Grain Exch. prices bid January 4:
Milo: Carlots, 1.82½@1.85; Eastern, bulk, 1.50@1.70.
Kafir: Eastern, 1.56¼@1.62½.
Corn: Bulk, Yellow, 1.85@1.90¼; sacked, 1.95.
Wheat: Mixed feed, Mont., 34.00.
Barley: 1.60.

HAY

Alfalfa Growers of California, report under date of January 5:
Demand continued during the week at the previous rate and was met with sufficient supplies. The present tendency in all lines of business, of buying only for immediate needs and of carrying as small stocks as possible, also extends to alfalfa, but in the case of alfalfa the situation is fortunately much better, supplies in the hands of dealers and users being already below normal, while the stocks still left in the hands of growers will all be needed before new hay becomes available. The position of milo is much less favorable. We have therefore so far this season not held out much, if any, hope to our milo growing members for an improvement in the situation.
There were 880 tons received on the tracks in Los Angeles the week ending January 1, 1921, with 270 tons held over as against 750 tons the week before.

Rabbit	41.00
No. 1 dairy	28.00
Standard alfalfa	24.00
Stock	20.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	20.00@24.00
Barley	18.00@22.00
Alfalfa	20.00@28.00
Barley straw	6.00@10.00

San Francisco Markets

Barley: New feed, 1.45@1.55; shipping, 1.75@1.85.
Shorts, 33@44.
Middlings: 52@55.

HAY

Alfalfa Growers of California under date of January 5:
Comparatively large arrivals of Nevada hay, in excess of the current rate of consumption, caused a temporary oversupply and corresponding shading of price.

No. 1 dairy	23.00
Standard alfalfa	20.00
Stock alfalfa	17.00

Under date of Jan. 3, A. W. Scott Co. says:
Receipts past week, 675 tons. In spite of the very light receipts the prices in San Francisco have in some grades still further declined and the influence of this market is felt throughout the state, quite a number of sales having been reported at $4 a ton lower than the ruling figures for the past few weeks. This is normally the dullest week in the year in the hay and feed trade and indications for the next few weeks are not particularly encouraging. Still further general weakness and decline in millfeeds and feedstuffs of all kinds weakens the feeling in the hay market. Better grades of hay seem to be weakened, although alfalfa has dropped off by reason of the heavy shipments coming in from Nevada at cut figures.
We quote today wholesale prices in carload lots as appear from dealers' transactions upon the hay market in San Francisco (for prices to consumers charge of cartage, commission and handling expenses must be added, according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5 wire bales	19.00@20.00
Tame Oat Hay, fair to choice	18.00@20.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	18.00@20.00
Stock Hay	10.00@14.00

Citrus Markets

Los Angeles, January 5, 1921.

Packing houses are starting up and regular season's shipments will be in full swing within the next two or three weeks. Such shipments as have been made have found a much better reception than last week. F. o. b. prices up to the present time are around the $3 point. Central and Northern California have practically finished on Navels.
The lemon situation is materially unchanged, with little hope of immediate betterment.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 1,356 cars; lemons, 757; total, 2,113. To same date last season: Oranges, 3,567; lemons, 600; total, 4,167. From Central California to date, this season: Oranges, 3,705; lemons, 34; total, 3,739. To same date last season: Oranges, 3,259; lemons, 120; total, 3,379. From Northern California to date this season: Oranges, 290; lemons, 3; total, 293. To same date last season: Oranges, 259; lemons, 20; total, 279.

PROTECT FORESTS

A demand is growing on the part of the wood using industries and the public at large for a national policy of forestry which will insure adequate future supplies of timber and other forest products. Figures gathered by the forest service this year showed the extent of the depletion of the nation's forests, and have served to focus attention on the fact that the country is short of growing forests and that something must be done at once. The acute shortage and skyrocketing prices of lumber and newsprint early in the year also contributed to the growth of the movement.
The forest service is advocating a program based on the conviction that the problem is national and not local, and must be handled as such. Nation wide protection from forest fire for all classes of forest land is the first and most essential step and it is the belief of Chief Forester Greeley that the police powers of the states offer the best means of enforcing reasonable requirements against forest destruction.
There are still large quantities of timber in the United States, but they are not in the right place. More than 60 per cent of what is left lies west of the Great Plains, far from the bulk of the country's population, agriculture and manufacture. The country is taking about 26 billion feet of wood from forests each year and is growing only six billion.
"We have used up our forests without growing new ones," says the report. "At the bottom of the whole problem is idle forest land. The United States contains 326 million acres of cut-over or denuded forest containing no saw timber; 81 million acres of this amount have been completely devastated by forest fires and methods of cutting which destroy or prevent new timber growth.
"The area of idle or largely idle land is being increased by from three to four million acres annually as the cutting and burning of forests continues." These facts, together with the steadily increasing distance between the average saw mill and the home builder "have had a vital bearing on the high cost of lumber, which during the year reached a prohibitive figure for many uses and checked the building of homes which is so urgently needed."

This year's export of grapes from Almeria, Spain, is about 300,000 bushels less than that of 1918, but about 50,000 bushels greater than that of 1919. Great Britain is the greatest purchaser, buying 851,000 barrels. The United States is second, purchasing 249,000 barrels. Third on the list is Norway with 60,000 barrels.

STORES OF PAINT IN SALTON SEA

Several years ago a number of men took up profitless mineral claims on Mullet Island, a tiny volcanic formation protruding above the saline waters of the Salton Sea of Southern California Gold and pumice were the minerals they were seeking, and little did they think that the waters which lapped against their rocky shores hid from their view a mineral deposit of another variety and practically incalculable value.

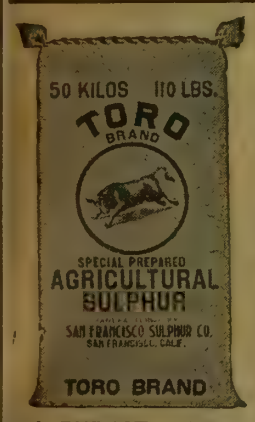
Last year the Salton Sea developed another of its characteristic temperamental streaks. Its surface level dropped 4½ feet, leaving Mullet Island surrounded by hundreds of acres of soft slimy mud. Presently the attention of the prospectors was attracted to the mudflats by a strong odor of sulphurous gas and noises which sounded like the fierce boiling of thousands of teakettles of colossal proportions.

They investigated by providing themselves with long wooden shoes resembling a hybrid ski and snowshoe with which they were able to walk about over the slimy mud without bogging At no great distance from the shore they found, uncovered by receding waters of the sea, numberless boiling hot springs, tiny geysers and mud volcanoes. From these flowed various colored saline waters, some bright red, others green, blue, and yellow, with all the intermediate shades of the rainbow. Great accumulations of the material were soon built up around each of the springs, and samples were soon in the hands of a chemist Analysis disclosed it to be mineral paint pigments; ocher, carmine, ultramarine and all the other colors essential in the manufacturing of paints.

The prospectors immediately began the construction of impounding reservoirs to segregate the waters from the springs of individual colors The boiling water is drained very slowly through these impounding beds, and the cooling causes the paint pigment to be precipitated to the bottom of the pools.

After several days of aeration, the water from each spring is diverted into another pool. Then, after drying in the sun for a few hours hundreds of pounds of pigment are spaded out of each pool. The pigment is first dug out into boxes, trundled onto the island in wheelbarrows and later sacked for shipment to the paint factories. It comes from the pools practically pure and requires little or no refining.

A crop of low grade salt is a profitable by-product of the newly developed pigment industry—John Edwin Hoag in Popular Mechanics.



SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards six times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Suphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 220 POUNDS PER ACRE of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR — or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6, 7 and 8.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for Price-list and Samples.

Book Review

PASTORAL AND AGRICULTURAL BOTANY

"Pastoral and Agricultural Botany," by John W. Harshberger, Ph. D., University of Pennsylvania, published by P. Blakiston's Son & Co., Philadelphia.

This book is not so botanical as it appears from its title for as one looks through the illustrations appear to be largely of livestock. There are, however, many illustrations and descriptions of poisonous plants. The illustrations of livestock have to do with the effects of these poisonous plants. The illustrations and the text, however, do not treat entirely of poisonous plants as many of the country's most valuable economically are given place. There are 18 chapters in the 300 pages touching upon stock killing plants, poisoning by plants, fungi and other spore bearing plants, gymnospermous, monocotyledonous, dicotyledons, loco and other poisonous plants, feeds and feeding, structure of grasses, description of important forage plants, cereals, leguminosae, root tubercles, weeds and weed control, agricultural seeds, seed selection and testing. "During and since the great world war there has been a growing demand for information on the injurious and useful plants of America. The injurious plants are represented by those belonging to the lower phyla, the thallophytes, which include the fungi destructive to farm crops, and the higher flowering plants, which are some of them also injurious. Particular attention is given to the flowering plants, with casual mention of the flowerless forms. The contents of the pages, which follow, epitomize the laboratory and research work of the writer connected with a course in botany given to the veterinary students of the University of Pennsylvania for the past 25 years."

The material presented is all of practical value, being the result of professional study combined with practical experience of stockmen, farmers, agricultural professors, botanists, etc. It points out the useful plants to cultivate and the dangerous plants to destroy, the effect of poisonous plants when eaten, active principles in the plant, susceptibility of various animals, remedies to employ, distribution of plants and destruction methods.

PORTO RICO NOTES

From the 1919 report of the Porto Rico experiment station, just received, we glean the following which may be of interest. Citrus scab is their most serious orange disease and is worst where leaf growth is greatest and in the shade. Some trouble is experienced with citrus thrips. Cover crops are receiving attention and the velvet bean is giving good results. Budwood selection is being practiced.

Hundreds of improved budded mangoes were sent out in the past few years, fruits are now becoming common and some are shipped to New York. The growing of avocados is steadily increasing and Guatemalan varieties are being introduced. As no refrigeration on ships is available, the native or soft shells cannot be exported. The rice and bean acreage is each year being extended but difficulty is experienced in getting corn varieties suited to the climate. Duncan and Triumph are the leading pomelos, the Duncan being the better, though Triumph is the earlier.

Clear Lake in Lake County now has more water than at its highest last year.

Much rice is still unharvested because of late rains and it is now asserted that some which was bound and shocked will remain in field until spring.

BUY THEM CHEAP

REGISTERED POLAND CHINA HOGS

Without a peer for prolificacy, size and easy feeding qualities. They will market your cheap grain, your skim milk and wastes at a handsome profit. Not since 1910 has the ratio of grain to pork been as favorable to the hog man as today. Declines have affected the price of pure breds more than the price of market hogs. Today you can market your hogs through the Farm Bureau auctions for more than through the Chicago stock yards. The price of pure bred Polands has declined so that today the first cost need not prevent any one from owning some. Buy them as cheap as you can at Fourth Public Sale, Fresno Fair Grounds.

Drill for the Extra Bushels

E-B Grain Drills Put the Seed Where It Will Grow

All of your seed planted right will give you the extra bushels at harvest time, which mean greater profits. E-B Grain Drills are built to put the seed where it belongs—*at the bottom of the furrow.*

With an E-B Drill you can do a thorough job in weedy or trashy fields and on rough or hilly ground, for the seed is planted evenly without skipping or clogging. The E-B Grain Feed—a combination of the fluted feed and the double-run or internal feed type—sows each kernel of grain whole. There is no waste from bunched or cracked seeds.

You can see this drill now on the floor of the E-B dealer in your vicinity. Be sure you find out about these points: (1) the Eccentric Spring Lift, (2) the Grain Feed, (3) the E-B Single-Disc Closed Delivery Opener and (4) E-B-Double-Disc Furrow Opener.

Get the good out of the good seed you plant by using an E-B Grain Drill—power or horse-drawn.

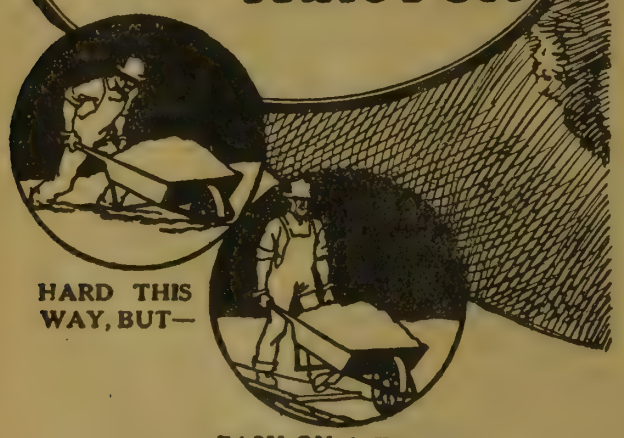
Cletrac
TANK-TYPE TRACTOR



HARD THIS WAY, BUT—

EASY ON A TRACK THE CLETRAC WAY

SPECIFICATIONS

Horsepower: 12 at drawbar, 20 at belt-pulley.
Length: 96 inches.
Width: 50 inches.
Height: 52 inches.
Weight: 3420 pounds.
Turning Circle: 12 feet.
Traction Surface: About 800 square inches.
Center to Center of Tracks: 38 inches.
Belt Pulley: Diameter 8 inches, face 6 inches.

"Stands Up" the World Over

CLETRAC carries power farming to the four corners of the earth. It is helping to modernize the farming customs of sixty-five countries. Its ground-gripping tracks, its heavy-duty motor and its sturdy, stand-the-gaff construction adapt it to climatic and soil conditions in all parts of the world.

In the far North, where the short, intense season makes speed the first consideration, Cletrac's "more work per day" ability has won prompt popularity among farmers.

And Cletracs are equally in demand in tropical countries where man and beast so quickly "succumb" under the burning southern sun.

But it is Cletrac's ability to stand up under constant use—to keep steadily on the go—that counts most in the far places where broken or worn parts may mean weeks of idleness. And, of course, that's just as big a factor in Cletrac's year-'round dependability here at home.

Wherever you are there is a Cletrac dealer near you. Ask him about Cletrac. Write us today for the booklet *"Selecting Your Tractor"*—it tells the whole story, how Cletrac does "more work per day, more days in the year."

Planning and Planting a Vineyard---Nursery Stock

By Fred K. Howard

AFTER the variety or varieties have been decided upon and the land put in shape for planting, the prospective grower has for consideration the very important question of nursery stock. Fortunately, the grape is as a rule easily propagated by cuttings, so the cost of securing good stock is comparatively small. It should be remembered, however, that the selection of good nursery stock for planting is as necessary to the permanent success of a vineyard as is the use of high grade or pure bred animals in the live-stock business. Demand and accept only the best from your nurseryman.

Even when the grower uses every precaution possible there are several things over which he has very little control which may mean the difference between success and failure, and at this time it may be well to consider some of these things as they relate to the use of rooted vines and the possibility of using cuttings planted directly into the vineyard.

In this issue of the Cultivator we will consider only a few of the important points relating to rooted vines, leaving until another issue the discussion of Phylloxera, a tiny root louse, which is indeed a very serious vineyard pest.

Rootings Versus Cuttings

Shall we use cuttings or rooted vines in planting? If we decide on the rooted vine, then we must be sure they are true to name, that they are free from disease and are not harboring any of the numerous insect pests, for who wants to start a new vineyard with a serious handicap of this sort? If we decide on the cuttings, is it best to plant them directly into the vineyard, or shall we grow them a year in the nursery row? Let us consider these matters a bit.

The cost of rooted vines is at the present time quite high when the cost of growing them is considered. These vines are grown largely as a side line or as an intercrop in the young vineyard or orchard, and the planter can have no assurance that they were produced from strong, vigorous, healthy parent vines or that they are even true to name. It has happened many times that a grower has planted rootings and cared for them until they were of bearing age, only to find that the stock had been so badly mixed that his vineyard was an eyesore. On the other hand, when rooted vines are planted the stand is usually good and the growth is uniform, if only good strong vines were used.

When cuttings are used and planted directly in the vineyard, unless the land is level and plenty of water is available at all times, the venture is almost sure to be a dismal failure. If, however, the cuttings are properly selected and the right kind of care is given them, it is very probable that it will be impossible to tell the difference in growth between cuttings and rooted vines at the end of the third growing season. This method of starting a vineyard is very popular among growers who have been particular with their leveling and preparation of the land. Perhaps a better method is to carefully select the cuttings and plant them in the nursery row for a year, right on the ranch. They can be easily cared for in this manner, and as approximately 50,000 rootings can be grown to the acre, very little space is used. The balance of the land can then be used for some other purpose which will bring in the usually much needed cash.

Leaving the question of selecting rooted vines for future discussion in the Cultivator, we will outline a few of the essentials which will contribute to the success of planting cuttings.

Selecting the Cuttings

One of the most serious objections to the use of cuttings in the vineyard is that they will not as a rule show a uniform growth, due to the fact that some of the wood used will have a greater supply of reserve plant food stored up and will therefore get a stronger start. This objection, however, may be partially overcome by careful selection of the cuttings.

Although many growers do not consider it worth while, and in fact a greater share of the cuttings made are taken where they are the most easily secured, there can be no question in the light of recent horticultural development that it pays to use cuttings only from strong, vigorous vines which have produced uniformly good crops over a period of years. Only the fruit or bearing wood should be used. Unhealthy vines should, of course, be avoided in all cases, as should vines which have been defoliated or injured by insect attack or which have suffered during the season from lack of water.

The cuttings should be made, if possible, within a month after the leaves have fallen. Be sure to avoid wood which has sustained possible frost injury. Select only the well ripened wood with medium distances between joints and ranging in size from one-third to two-thirds inch in diameter. The use of mallet cuttings, those on which a piece of the old wood is left at the base, should be avoided, as the old wood will in time decay and may spread root rot to the trunk and roots of the vine. Using only one cutting from a cane, and selecting that wood as near the base as is possible, is a practice that is to be recommended, although the cost of making such cuttings will be greater. The maturity or ripeness is indicated by the firmness of the wood: soft, pulpy cuttings should be avoided, although the wood should be moist enough that a little sap may be squeezed from a newly made cut. The pith should be light colored and the buds well formed

Testing for Starch

A test which will indicate the presence of sufficient reserve plant food can be made by applying a solution of iodine and alcohol to a freshly made slanting cut through the cutting. This solution is made as follows: One part (by weight) iodine, 100 parts (by weight) 75 per cent alcohol. If there is plenty of plant food in the cutting the entire cut surface will turn dark in three or four minutes. If not, only spots of dark will appear, and such cuttings should not be used.

Never use wood for cuttings that has been pruned off and left exposed to the sun and frosts for several days, if you expect to get the best results. Careful personal supervision of the making of cuttings, and particularly the selection of the best wood from good vines, is a paying investment, especially if the cuttings are to be planted in vineyard form. The penalty for carelessness is an uneven stand, and this never can be satisfactorily corrected.

Length of Cuttings

The length the cuttings should be made depends largely upon the type of soil in which they are to be grown. Roots will form only where the conditions of heat and moisture will permit, therefore a long cutting in wet, heavy soil is almost sure to fail, and a short cutting in light sandy soil will often dry out before it has a chance to start. In general cuttings from 16 to 18 inches in length will succeed best in light soils and from 12 to 14 inches in heavy soils. The length will of course vary somewhat, due to the difference in distance between joints. The cut at the base end should be made just below the joint, while that on the upper end may be made an inch or even more above the joint.

Care of Cuttings Before Planting

The cuttings should not be left in the field any longer than necessary after they are made, and in no case should they be left exposed over night. The cuttings should be loosely tied together in bundles and placed in a trench on some well drained place, preferably in the shade, and carefully covered with soil. The usual practice is to bury the cuttings butt end up. This may not be necessary; but at least every care should be given to prevent the leaves from starting before the roots do, as the reserve supply of plant food in the cutting may be easily used up in this manner before the roots are far enough advanced to replenish it. In covering with dirt be sure that it is well worked down around the cuttings to prevent too much drying out. Frequent examinations should be made to determine the exact conditions, as too much or too little moisture in the soil may mean failure.

The First Season's Growth

The success of this Thompson vineyard is due to good soil, plenty of water and intelligent care. The owner expects enough fruit next year to pay the cost of cultivation. Photo by Fred K. Howard.

STRAWBERRY ROOT WEEVIL SITUATION

A conference was held by the Oregon state board of horticulture in Portland, Oregon, December 17, to consider the strawberry root weevil situation, with particular reference to the action taken by California in issuing Quarantine Regulation No. 8.

It was arranged that a survey be made by the entomologists of the Oregon agricultural college to determine the areas infested by the three weevils, Otiorhynchus rugifrons, Otiorhynchus ovatus and Otiorhynchus sulcatus. The Oregon board of horticulture will quarantine those areas in Oregon found to be infested, prohibiting shipment of strawberry plants from infested to non-infested areas.

The writer attended the above meeting and agreed to recommend that the director of agriculture modify or amend, as the case may be, Quarantine Regulation No. 8 to conform to the findings of the Oregon authorities. At the same time the three species of weevil will be included in the quarantine instead of, as at present, the one weevil, rugifrons.

It will also be necessary to extend the quarantine regulation to apply to the state of Washington, in view of the following information contained in a communication from M. L. Dean, chief, division of horticulture, Olympia, Washington:

"We are about to promulgate a quarantine covering our entire state, forbidding the shipping of plants except from beds which have been carefully inspected and carrying with them a clean certificate. I believe it would be well for you to advise shippers to require certificates on plants coming from Washington, as a protection against possible infestation. We have the weevil in many sections of the state and have found it is difficult to control shippers who make a promiscuous business of gathering plants and disbursing them to the trade."

It would appear impracticable, as well as hazardous, to confine quarantine action to infested beds. Such action must be made to apply to well defined districts and, in many cases, to counties.

A meeting of persons interested in this matter will be called in San Francisco in the near future to consider immediate and equitable quarantine action. The date will be announced within the next week.—Lee A. Strong.

Agricultural News Notes of the Pacific Coast

Northern California

Ukiah, Mendocino County, has shipped 1,500 bales of hops.

California is the biggest pear producing state in the Union.

Petaluma is making carload shipments of eggs to New York.

The Sacramento Valley is shipping 9,000 sacks of beans to Havana.

Ranchers about Susanville are pleased with the heavy rains and snowfalls.

The Knightsen irrigation district in Contra Costa County plans to hold a bond election in the near future.

Eldorado-Amador Livestock Association is aiding in reducing indebtedness of the Cattlemen's Association.

Eldorado County irrigators are endeavoring to organize an irrigation district which will probably include Placerville.

The state water commission reports applications for appropriation of water to irrigate 10,000,000 acres during the past two years.

Heavy rains caused a landslide on the state highway between Valdor and Helena, in Trinity County, blocking the roads for five weeks.

Members of the Live Oak farm center of Sutter County are planning to slaughter 50 hogs and 20 sheep and offer the meat for public sale.

A large tract of land near Rio Vista has been purchased by San Francisco capitalists and will be planted to walnuts and used in diversified farming.

Ground has been broken for the erection of the Sacramento Valley Meat Canning and Provision Company's plant in the city of Sacramento.

Yolo County fruit producers are signing contracts for next season's production. Papers announce "high prices are the rule" but no figures are given.

Secretary Wilson of the Agricultural Legislative Committee has been explaining to farmers organizations the work of the committee in Sacramento.

Butte County rice growers are calling attention to the fact that the 1913 crop of rice was not harvested until March and yet it was a most successful season.

Reports on file at the office of the Pacific Rice Growers Association show that of a crop estimated approximately at 4,000,000 bags, only 1,500,000 have so far been harvested.

Glenn County farm bureau centers will hold meetings during January at Willows, 17; Capay, 19; Plaza, 21; Elk Creek, 24; Grapevine, 26; Larkin, 28; directors meeting, 22.

The farm bureau of Sonoma County has organized a department of viticulture. An annual membership drive is now on in which it is hoped to increase the membership to 1,500.

The annual report of the California Cattlemen at its meeting in San Francisco brought out the fact that the present membership totals 2,707. T. H. Ramsay of Red Bluff was chosen president.

Reclamation districts of the Sacramento Valley have appointed a committee to appear before the railroad commission on January 17, when it is expected that new rates for electricity will be fixed.

Central California

Tulare County farm bureau is campaigning for a large increase in membership.

Kings County farm bureau cow testing association has a membership of 1,143 cows.

Prune and apricot growers of Los Gatos, Santa Clara County, are signing up the new contract.

Due to the holidays, many of the fat hog auctions were called off during the past two weeks.

Chester H. Rowell has been appointed by Governor Stephens a member of the state railroad commission.

Tulare County is conducting a squirrel cleanup campaign. Carbon bisulphide is the principal ammunition.

The annual meeting of the California Grape Growers Exchange was held on Tuesday of this week in San Francisco.

The California State Automobile Association has erected over 7,000 new road signs in central and northern California.

Santa Cruz County farm bureau meetings: Mountain, January 17,; Aptos, 21; Happy Valley, 28; directors meeting, 21.

Kern County farm bureau meetings will be held at Mountain View, January 17; Pond, 19; Inyo-Kern, 20; Rosedale, 21.

Farm bureaus of the valley are generally endorsing bulk grain handling and many elevators will be built before next harvest.

President Walker of the state farm bureau federation attended the recent annual meeting of the Stanislaus County bureau last week.

It is expected that the 12 directors of the Central California Milk Producers will resign this week and an entirely new board be elected.

Some Santa Cruz County strawberry fields which have been seriously injured by rising alkali are improved by the heavy rains of this reason.

Directors of Tulare County water district No. 1 recently met at the Alpaugh Water Company's office and elected officers for the coming year.

Kings County farm bureau has organized and filed articles of incorporation of the Kings County farm bureau exchange, a marketing organization.

California Associated Raisin Company and the Peach and Fig Growers are both contemplating a building program which will expend over a million dollars.

Lindsay has installed a water pressure gauge in the city clerk's office so that the municipal water supply shall not be allowed to fall below an established minimum.

One of the features which is attracting much interest from farmers and seedmen is the pure seed bill which has been introduced into the legislature by Assemblyman Cummins.

Fresno County farm bureau meetings will be held at Selma, January 15; Kingsburg, 18; Reedley, 19; Sanger and Fowler, 20; Bowles, 21; San Joaquin, 25; directors meeting at Fresno, January 26, and centers at Parlier, 27; Bullard, 28. Several of the centers have held fig pruning demonstrations in charge of I. J. Condit.

Southern California

Garden Grove walnut packing house has been closed for the season.

Packing houses in nearly all Navel sections are now running full handed.

The Yucaipa Valley produced 7,710,050 pounds of deciduous fruits in 1920.

The third annual institute of the walnut growers is being held at Whittier this week.

The Fordney emergency tariff bill, new before congress, provides a 1¼ cents per box tariff on lemons.

Members of the Tustin and Garden Grove pig clubs of Orange County recently took auto trip to Diamond Bar hog ranch.

Poultrymen of the San Dimas, Los Angeles County, section, are holding meetings, contemplating the formation of a poultrymen's association.

At a meeting of San Diego dairymen to consider new rules for cow testing a new slogan was adopted: "We don't ask profit on inefficient cows."

Sugar beet growers of Southern California have an organization committee at work which it is hoped will succeed in giving satisfactory return to the grower.

Palo Verde Valley ranchers of Riverside County have placed orders for more than 250,000 rooted grape cuttings for spring planting, mostly of Thompson and Malaga.

Manager Greene of the Dairy Council has been visiting various Southern California points during the past week and holding sessions with milk producers and distributors.

Fruit grower's organizations in all southern counties have held meetings of late and adopted a lower wage scale for all classes of workers than the one prevailing last year.

A representative of orange shippers in South Africa, now visiting local plants, says his country ships oranges to England in 30 days, arriving in splendid condition after the ride of 9,000 miles.

George McFee, Orange County sealer of weights and measures, estimates that the county's farmers saved more than $11,000 in 1920 through having barnyard manure analyzed before purchasing.

Dairymen of Imperial Valley have been holding meetings, listening to addresses by Dean Van Norman and others and endeavoring to put the dairy business of that county on a more profitable basis.

D. D. Sharp, horticultural commissioner of Riverside County, is urging peach and apricot growers to spray trees now and again in spring before buds swell, first with Bordeaux and later with lime-sulphur.

The Golden Orange Groves, Inc., met at Covina last week and authorized purchase of a spraying outfit, also a "fire fighter" trailer from the county for $400, and appointed a committee to investigate cost of cooperative fumigation.

The Edison Company of Los Angeles contemplates the most gigantic power development on the Colorado River, which will not only develop hydroelectric power in excess of any similar project, but store sufficient water to irrigate 3,000,000 additional acres.

The Coast and General

Hawaiian Islands Arbor Day is November 19.

Hood River, Oregon, still has 400,000 boxes of apples to ship.

The Cuban pineapple crop will be 100,000 crates greater than that of 1919.

The University of Missouri is working for a new building of the college of agriculture.

California's canned fruit and vegetable output aggregates an annual value of $108,096,875.

Florida's shipments of grapefruit for this season totals about 4,000 cars; of oranges about 6,600 cars.

Florida citrus shippers are again opening packing houses which were closed during the holiday season.

The president of the Washington Potato Growers Association, recently elected, is George Cannon of Buckeye, Washington.

A wage cut of 25 per cent has been made in nearly all the lumber mills of the Northwest. 60,000 workmen are affected.

Market centers of the East are reporting scarcity of truck farm supplies largely because of high transportation costs.

Dairymen of Montana recently convened at Great Falls and discussed cooperative marketing.

Montana farmers are digging pit silos in preparation for storing more of next summer's crops.

The coffee crop of the republic of Salvador will run around 300,000 bags, a serious reduction over former years crops.

Sonora, Mexico, is planning utilization of the waters of the Sonora River so as to bring thousands of acres under intensive cultivation.

Oregon truck growers are standardizing and reducing size of containers, hoping hereafter to ship higher quality to arrive in better condition.

One serious pest of the prune in Oregon is the prune leaf spot. The experiment station is recommending its control with weak Bordeaux.

Small fruit growers of the Northwest are making every effort to secure tariff on currants and other small fruits from Mediterranean sections.

The eighteenth annual corn show of the Missouri Corn Growers Association is being held at the college of agriculture at Columbia. It will close January 21.

Yakima, Washington, shipped to Europe by refrigerator steamers, by way of the Panama Canal, 61 cars of Washington apples. Most of the apples went to London.

Conferences of six state associations met in Spokane last week. They included the potato growers, horticulturists, beekeepers, wheat farmers and Farmers Union.

Sugar beet growers of Utah are concerned over a root rot affecting many fields. The sugar companies have taken steps to eradicate or at least bring under control.

Hawaiian Islands quarantine and vaccinate against rabies all dogs which come to the islands from countries where rabies exists. They are required to remain in quarantine 40 days.

Problems of the Peach and Fig Growers

By Frank Wilson Before Fruit Growers at Fresno

OUR present and future problems certainly offer us at this time a fertile field for discussion. The past is behind us; in the present are the living issues; the future is always a problem.

I shall not attempt to deal with matters affecting our organization through the prosecution brought against the California Associated Raisin Company by the department of justice. The merits of this case have recently been argued before Judge Bledsoe in the federal court. National interest has been aroused by the prosecution of this case. The result is being awaited with much interest by both friend and foe of the cooperative movement.

As you are doubtless aware, a merger is now being effected between the California Peach Growers, Inc., and the California Fig Growers. This being the last year of operations under our peach contract, it became necessary to go before the growers for a renewal before the contract expired. In view of the deplorable condition of the fig market, an active sales organization seemed necessary; the Fig Association, up to this time, acting only in an advisory capacity, had not attempted the marketing of the product. After several conferences between prominent fig growers and our board of directors, a merger of the two interests was decided upon. Contracts have now been signed covering over 75 per cent of the total peach and fig acreages of the state.

With the peach interests our difficulties have been largely solved. Our "Practically Peeled" peach, packed under the "Blue Ribbon Brand," has grown in popularity, and widespread distribution has been secured. About 65 per cent of our sales for the present season have been under this brand, a high percentage being sold in 11 ounce, two pound and five pound cartons. In a comparatively short time we believe our entire offerings will be sold under the "Blue Ribbon Brand."

But the consolidation of the peach and fig interests brought many new problems. No food product offers greater opportunities for exploitation than the California fig. Few have received less attention. True, some of our most prominent fig packers have maintained a high standard of pack and their brands are widely and favorably known. Much of the product, however, packed and shipped as Choice California figs (not mentioning the cheaper grades) have been of inferior stock and have had a very depressing effect on the market. No special effort has been made to popularize this wholesome fruit. It is, perhaps, asking too much of the packer to expect him to expend large sums of money in national advertising or the carrying on of extensive experiments in the production of new uses of the fig, etc. In this, as in our other lines of food production, it devolves upon the producer to carry this burden. In so doing he must of necessity undertake the manufacturing and marketing of the crop, a brand must be established which stands for merit, and the quality of this brand must be maintained. Whether in the fresh, canned, or dried form, our offerings must be clean, wholesome and appetizing.

With the heavy new planting of figs now coming into bearing, the tonnage will in a short time be greatly increased. Provision must be made for the handling of this added tonnage; new and more enticing uses for the fig must be worked out; a national advertising campaign must be inaugurated. Along these lines I would say we are now having plans drawn for a modern, up to date packing and storage plant capable of turning out from eight to ten cars of finished product per day. Special attention is being given to economy in operations, sanitation, durability, etc. We hope this building will be completed and ready for occupancy before the coming delivery season.

Regarding our experimental work: For the past several weeks we have been carrying on extensive experiments in the production of new dishes and new uses of the fig, such as fig bread, fig pies, cakes, etc., figs canned in different degrees of syrup, fig bars, fig paste, etc. We hope, before the coming season, to have something good to offer the housewife, something which will be a ready seller and increase materially the consumptive demand for figs. We already have our plans perfected for a national advertising campaign.

Realizing that the fig industry is one requiring careful study, and to a degree expert knowledge, our management thought it necessary to employ the services of an expert in fig culture. Professor Condit, formerly of the University of California department of agriculture and more recently associated with J. C. Forkner as a specialist in fig culture, is now on our staff in connection with our standardization department. His duty is, among other things, to serve the grower, working with him in his cultural problems to reduce to a minimum the defective fruit common in our fig crop.

It is known that much of our plantings of White Adriatic and Calimyrna figs have been made where soil and climatic conditions are unfavorable. The result is a high percentage of smuts, sours, and defective fruit. These plantings should be at once top grafted to such varieties as the California Black Mission, the Kadota and others less susceptible to these defects.

Because of the extensive planting in recent years of the Calimyrna fig, which requires artificial pollenization, and in view of the scarcity of Caprifigs carrying the fig wasp used in this caprifying process, and the consequent high prices asked, we have decided to plant an extensive acreage to proven sorts of Caprifigs for distribution to the growers. We hope in a few years to be in a position to furnish these figs in necessary quantities and at reasonable prices.

These are some of the problems which we are encountering in connection with the growing and manufacturing departments of our business. I feel that all are in course of satisfactory solution. The big problem confronting us today is not so much with the growing and manufacturing—for here we get earnest cooperation—but rather with a certain branch of our marketing agency, which I regret to say in many cases has shown no sympathy with our work and leaves very much to be desired from a merchandising standpoint. I refer to the wholesale grocerymen and their attitude toward our grower organizations, as voiced in their trade journals, public utterances, and in many other ways. This condition is wholly undesirable and should not continue. Are the new and old systems of marketing so fundamentally different that we cannot function in a friendly manner? I am inclined to believe an application of a little personal equation might prove mutually beneficial. Certainly, to have an efficient marketing agency we must entertain more friendly relations toward each other. Let us hope these seeming differences may be speedily overcome, that we may enjoy a similar degree of cooperation from our marketing agents as we have in other departments of our business.

The fundamental principles of our organization are sound and enduring. While differences exist in types of organization, the underlying principles are the same. The degree of success we obtain is measured by the ability we display in the management of our affairs. In our operations mistakes will occur; we are not infallible. Let us benefit by these mistakes, making them the stepping stones to greater success.

For the past few years the people of this country have been experiencing prosperity almost unheard of, and we have been carried along in the flood of high prices and reckless extravagances—were in the clutch of conditions not our making and which we were powerless to change. I believe the period of adjustment is at hand.

The pendulum is swinging backward. "Conservatism" should be our watchword, our craft should be piloted into more placid waters until the breakers have passed. We should adopt a conservative policy, yet one tinctured with optimism. Our dealing must be on the level, giving a square deal to all, then we need have no fear for the future.

California Prune and Apricot Growers Association

WITH the ending of the season 1920-21 California Prune and Apricot Growers, Inc., will end its existence. There will be no effort to renew the contract, so the matter of forming a new association is up to the growers. We may say the matter of perpetuation or destruction of the industry is up to the growers.

Every grower who has been in the business for the past dozen years recalls the situation which prevailed when there was no organization. He also knows that the success of the past dozen years has been because of cooperation. Those who realize this to the fullest are awake to the necessities of the case and beginning this early are laying the foundation for a new California Prune and Apricot Growers Association. This shall differ from the old company in that it will be a non-stock, non-profit organization. The membership agreement is so long that we hesitate to give it entire, but it is of such vital interest that we believe it will be read by believers in cooperation, whether growers of prunes, of apricots or of other fruits.

* * *

Membership Agreement

The undersigned propose to organize a non-profit cooperative association, without capital stock, under the laws of the state of California, for the purpose of encouraging and fostering the business of producing and marketing prunes and apricots cooperatively; for reducing speculation; for stabilizing markets; for cooperatively and collectively handling the problems of prune and apricot growers; and for other pertinent purposes.

We, the undersigned grower or growers, in consideration of the premises and of our mutual undertakings and of the agreement of each and every other party hereto, do hereby agree as follows, each for himself and, collectively, for the express benefit of the association to be organized:

1. (a) Wherever the word "association" is used herein, it means the California Prune and Apricot Growers Association, a new, non-profit, cooperative association to be organized under the terms hereof.

(b) Wherever the term "old association" is used, it means the California Prune and Apricot Growers, Inc., an existing corporation under which prunes and apricots are being handled and marketed cooperatively.

(c) Wherever the term "warehousing corporation" is used herein, it means the Growers Packing and Warehousing Association, Inc., a corporation organized for the express purpose of packing, processing and physically handling prunes and apricots marketed by the old association.

(d) Wherever the term "grower" is used, it means a person or persons, firm or corporation engaged directly or indirectly, wholly or partly, in the production of prunes and apricots.

2 (a) We will become members of the California Prune and Apricot Growers Association, a non-profit, cooperative association to be organized under the laws of the state of California.

(b) The association will confine itself to the problems of packing and marketing prunes, apricots and apricot pits, and their by-products only, and for its members only.

(c) The association will have suitable articles of incorporation and suitable by-laws, stating the purposes and powers of the association; the rights and duties of members; the duties of directors and officers; the manner of forfeiture or transfer of membership; withdrawal or expulsion from membership; the value of property interests upon withdrawal or otherwise; and any other pertinent and important

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EDITORIALETTES

A bit of sugar and plenty of cream is all that is needed to make the cover illustration very appetizing. California is a great producer of small fruits, and by "small fruits" we are not referring to the size of the fruit in this particular illustration. A suggestion we would offer is that we grow more of this type of fruit; another, that we do not grow more until white American producers can be assured of disposal of a crop at fair prices. The growing of small fruits has proven exceptionally attractive to the Japanese and has practically resulted in their entire control of the business.

* * *

It's been nippy cold for a few nights. Citrus growers lighted the heaters, and while the newspapers announce "Not as bad as feared," it has been cool enough to cause considerable concern. As yet, however, no serious injury has occurred; 27 degrees is about the minimum reported from any citrus section.

* * *

The state legislature is sweating blood in its endeavor to provide money needed for conducting the state administration during the next biennium. It seems to be necessary to raise about $14,000,000 in excess of the amount raised during the preceding two years. It has been suggested that the money be raised by going back to the ad valorem tax. This suggestion has caused such serious opposition, however, that it is now thought about 30 per cent additional tax will be put upon the corporations, which means that ultimately it will come back to the consumer and producer of the state.

* * *

It is to be hoped the state legislature will eliminate the "indeterminate sentence law." It is believed by many to be a breeder of crime; in any case it adds no dignity to the law when the criminal understands that such measures give added chance for escape from just punishment. The administration of state laws is altogether too lax and the people will look with little favor on the effort to prevent the repeal of this law.

Harding has requested a simple and economical inauguration. There has been a lot of expensive folderol at many former inaugurations. It gives opportunity for pomp and display, but just at present the American people are not in a mood to enjoy paying for a big bunch of fiddlers to add merriment to the "elite" of Washington. Anyhow, why is an inaugural "ball"?

* * *

This matter of taxation is desperately perplexing and always recurring, but there is one thing we believe should be done, and that is that the people should take away from themselves their own vote upon taxation measures. The voter is unable to go to the adding machine and total the amount which various measures placed upon the ballot will add to the state's expenses, hence his vote is cast merely upon the impulse, or rather because of the appeal of an interested party, when it becomes easier to promise to vote for a measure than to argue with the enthusiast, especially where the enthusiast is working for an increase in salary. But the voting was done and millions have been added, and now we must raise the money. But this cannot always continue and the state remain solvent.

PRUNE AND APRICOT GROWERS

The California Prune and Apricot Growers, Inc., is about to be reorganized. It will be changed from a stock to a non-stock, non-profit, association. The contracts now in force between members and the corporation will expire with the handling of the 1921 prune and apricot crop.

There are now 11,000 grower members of the association. Unless practically 100 per cent of this membership signs the new contract the association will terminate and two great industries of the state be jeopardized. Perhaps this early in the new year it would be fairer and truer to speak from the optimistic side and say that if 100 per cent of the present membership does sign the new contract the success of the two great industries will be assured. This hopeful view is the only one to take of it, for with as intelligent a class as are the prune and apricot growers cooperation appeals as the only way of securing success to the growers.

We quote at length, on another page of this issue of the Cultivator, from the new contract. There is nothing in it that will work an injustice to any member; there is much in it of prosperity. We hope the contract will receive 100 per cent signature, and that without undue effort on the part of the management.

CALIFORNIA'S CROP REPORT

IN THE issue of California Cultivator of November 6 there was given a table of California crop production for the years 1918, 1919 and a very accurate estimate of the 1920 production. Those figures were made possible because of the affiliation of the bureau of crop estimates, United States department of agriculture, and the agricultural statistical service of the state department. Since the issuance of the early November report and estimate the two departments have been busy verifying and correcting and likewise gathering more complete data as to 1920 production. This data is received just as we are going to press so we can only give a hint of the value of the report, which will be quoted from more liberally in the next issue.

California's crop production in 1920 failed to measure up to the record year of 1919, and the terrific slump in prices toward the end of the season caused decided decrease in valuation of the crops compared with those of the preceding year. In fact, this lowering of price caused the abandonment of some fields which were never harvested. This is particularly true of rice and cotton. The total acreage of all field crops harvested during the year was 5,641,700. The preceding year's acreage totalled 5,739,440. The total tonnage of field crops was 8,437,000. The farm value to the grower in 1920 was $240,071,000 compared with $301,781,000 in 1919. In fruits the total production for 1920 was 2,530,000 tons which was valued to the grower at $236,955,000, or an average of about $94 per ton. The 1919 production was approximately 2,696,000 tons which was valued at $233,910,000. The grand total value of all products of the soil in California for the present year was $493,026,000, while their value in 1919 was $551,891,000.

Of all the field crops wheat showed the most marked decline in production. Compared with 1919 production that of 1920 was only 55.7 per cent. Beans came next, showing only 57 per cent. Cotton, on the other hand, showed great increase in production, 144.4 per cent compared with 1919. This was the greatest increase of any California product. Its price, however, was 18 cents as compared with 43 the preceding year. This severe decline resulted in a $12,000,000 crop as compared with a $21,000,000 crop in 1919.

Table showing more exactly production of both field crops and fruits next week.

AT SACRAMENTO

By R. P. Royce

Farmers have vital interest in the proceedings in the legislative halls at Sacramento. Mr. Royce is permanently located at the capital and will give each week notes of interest to Cultivator readers. The first installment arrives too late to use entire, but here are a few of the notes contained in the first report.

The first week of the legislative session is over and while little transpired that is of interest to the agricultural interests of this state, a casual observer could not escape the impression that when the mill starts grinding away in earnest, agriculture for the first time will be in a sufficiently strong position to see that measures affecting the welfare of that basic industry will be accorded the attention and consideration deserved.

This new order of affairs is due, first of all, to the fact that the agricultural legislative committee is on the job and because of the strength represented by the committee and its determined and conservative attitude it has gained the respect of the entire personnel of the legislature. Again, there seems to be a widespread feeling on the part of the members that the time has come when everything possible must be done to strengthen agriculture as an industry.

For several months the agricultural legislative committee has been investigating the general needs of agriculture and weeks before the session opened a rather definite program had been mapped out. As matters stand now, it is doubtful if any important agricultural measure that lacks the endorsement of the committee will stand much chance of passing, and on the other hand it is more than likely that the most of the features that have the backing of the committee will become laws. The committee proposes to aid in getting bills out of committee; to arrange hearings before the proper committees; to follow the various measures through the many necessary steps and to see that bills passed will not fail by veto.

Economy seems to be the most popular keynote at the beginning of the session, but it remains to be seen whether or not we will hear much of economy later.

Reapportionment will be one of the big problems of the present session and it is certain that Southern California will gain several new assemblymen and senators.

Assemblyman West of Sacramento has introduced a concurrent resolution asking for a complete investigation of the present status of the college of agriculture and the university farm school. The general opinion heard around the legislature is to the effect that the time has come when California agriculture must be provided with a college of agriculture that is in keeping with the industry of the state. Many members have expressed the opinion that the college of agriculture should be divorced from the University of California.

The agricultural committee of the senate is made up of the following senators: Rigdon, chairman; Arbuckle, Carr, F. M. Duncan, Jones, Nelson, Purkitt, Rush and Slater.

Senator Inman of Sacramento and Senator Purkitt of Willows each have a bill making gambling in futures in foodstuffs a felony. The bills are aimed at the different exchanges.

Long of Contra Costa County and Colburn of San Diego have bills relating to the destruction and storage of foods. The Long bill will make it a felony to willfully destroy food fit for human consumption. The Colburn bill declares it a felony to hold food in cold storage for such long periods as to cause it to spoil.

Threaded Rubber Insulation saves your pocketbook

THREAD-RUBBER INSULATION
STORAGE BATTERY
Willard

This trade-mark tells you that the plates in your battery are *insulated*—not merely *separated*. Willard Threaded Rubber Batteries are selected by the best brains in the automobile business as standard equipment for 156 makes of cars and trucks, and for export only on 7 others.

Willard Threaded Rubber Insulation removes the one big bugaboo that haunts every owner of a wood separator battery—the knowledge that long before his battery is worn out he will have to go to the expense and trouble of having new separators put in.

Threaded Rubber Insulation saves your pocketbook because it doesn't carbonize, puncture, warp or crack—because it does stay on the job, outlasting the plates.

More miles of uninterrupted service per dollar.

You can buy the Willard Threaded Rubber Battery of any of the dealers in your territory listed below. They all give authorized Willard service:

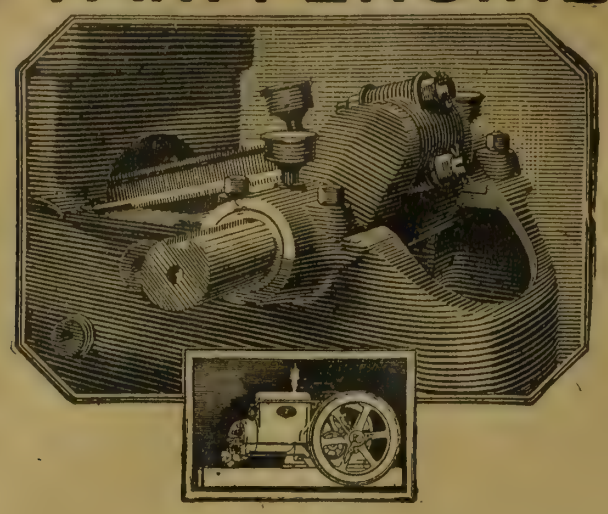
FAIRBANKS-MORSE "Z" FARM ENGINES



The "Z" Lives a Long and Useful Life

The "Z" Engine is built for service and long life. It has case hardened parts, steel forgings, large crankshaft, die-cast, removable bearings. "Z" parts are accurately made by precise machine work. Every part is individually inspected before being assembled into the engine.

The methods used in manufacturing "Z" Engines are the same methods used in building automobile engines—never before considered necessary or possible for farm engines.

Other "Z" features are: Runs on kerosene as well as gasoline; Bosch magneto; more than rated power; parts interchangeable; clean-cut design.

Let your nearby dealer show you these features that have been so appreciated in over a quarter-million "Z" engines bought to date by farmers.

TEAGUE TREES

Ask the man who has planted them and he will tell you that Teague Trees are unequaled in growth and productiveness.

They are the best that can be produced.

If you intend planting CITRUS TREES it will pay you to come and see our stock and let us figure on your requirements while we still have a good assortment to select from, as the supply of good trees is limited.

Avocados, Feijoas and other Tropical fruit trees in all of the recommended varieties.

Send for our new descriptive price list and tell us what you intend to plant.

When Writing Advertisers Mention California Cultivator

CALIFORNIA PRUNE AND APRICOT GROWERS ASSOCIATION

(Continued from Page 69.)

points, all as determined by the organization committee hereafter provided.

3. The association may include in its membership any prune or apricot grower, or the landlord or tenant, or lessor or lessee, of orchards on which prunes or apricots are grown, provided the landlord or lessor receives all or part of his rental in prunes or apricots.

4. The affairs of the association shall be controlled by a board of 15 directors, and the office and principal place of business of the association shall be at San Jose, California. Business offices or branches may be established anywhere throughout the world.

5. (a) The members, through the voting board hereafter provided, shall elect annually 14 directors from among members growing prunes or apricots, maintaining at all times a fair and equitable representation of the prune and apricot producing districts included in the membership.

(b) One director may be a person nominated in writing by the governor of the state of California; and when elected he shall have full authority as a director, representing primarily the interests of the general public in the conduct of the association.

No person shall be elected as such director unless the name has first been approved by a majority of the voting board.

(c) The board shall appoint an executive committee of five directors to conduct the detailed affairs of the association, subject to the general control of the board of directors.

6. Every member of the association shall have one vote.

7. Every member of the association shall pay an entrance or membership fee of $10. The property interest of all members in the association shall be equal.

8. (a) The undersigned grower hereby appoints a voting board as his proxy and attorney, to vote in his name, place and stead for him and representing his interests and the joint interests of all other growers at all annual, regular, or special meetings of the members of the association, or otherwise, where a member may be called on to act in or for the association, with the same powers and rights as the grower himself would have if personally present, from the date of execution of this proxy, agreed as July 31, 1921, for a full period of seven years thereafter. The voting board shall consist of 39 members, representing the various districts as here set forth:

Two from District 1, including Butte, Shasta and Tehama Counties.

One from District 2, including Yuba and Sutter Counties.

One from District 3, including Colusa and Glenn Counties.

One from District 4, including Merced, Stanislaus, San Joaquin, Sacramento, Placer, Amador and Eldorado Counties.

Two from District 5, including Yolo and Solano Counties.

Two from District 6, including Napa County.

Five from District 7, including Sonoma, Mendocino and Lake Counties.

Sixteen from District 8, including Contra Costa, Alameda, Santa Clara and San Mateo Counties.

Two from District 9, including San Benito, Monterey and Santa Cruz Counties.

Two from District 10, including San Luis Obispo, Santa Barbara, Ventura and Los Angeles Counties.

Two from District 11, including Orange, Riverside, San Diego and San Bernardino Counties.

Three from district 12, including Kern, Tulare, Kings, Fresno and Madera Counties.

Counties not named here, but which now or hereafter may have any membership producing prunes or apricots, shall be included in the nearest or most convenient district, as the board of directors may decide.

(b) The members of the voting board shall be selected by ballot by the members in the respective districts. The organization committee shall provide for primary elections to choose nominees from each district in double the number of the places to be filled. The election shall be held in each respective district by mail to elect the members of the voting board from such district. The organization committee shall provide for such primary and final elections to take place July 31, 1921, and the names of members so elected shall be certified by said organization committee and shall be deemed for all purposes to have been specified in this agreement as a voting board prior to the date of execution hereof.

(c) This voting board, so elected, shall select the directors for the first year and each year thereafter.

(d) No person may serve as a director and as a member of the voting board at the same time.

(e) The voting board shall determine all questions by majority vote.

(f) The voting board shall meet whenever it may deem it necessary; elect its own chairman and secretary and conduct its own method and manner of meeting; fill vacancies by election of other members as hereafter provided; expel any member of the voting board who, in the judgment of two-thirds of the total board, may not represent the best interests of the growers as a whole, in the conclusive judgment of the voting board; and give the greatest possible care to the selection of proper directors to represent the interests of the growers and to recommendations for the guidance of the board in the conduct of the business of the association.

(g) All expenses of the voting board, including such compensation as it may determine for its members performing regular duties for the board, or otherwise, shall be paid by the association as part of its general expenses.

(h) On written demand or vote of 16 of the voting board any particular problem or problems of the association shall be referred to the full membership of the association. In such event the proxy and power of attorney shall be temporarily suspended and the entire membership shall be requested to vote thereon. The voting board shall thereupon vote as a unit as a majority of the association members so voting shall determine.

(i) Twenty-five per cent of the membership in any district may call an election in that district to demand that resignation of all or any members of the voting board from such district, and the members of the voting board shall act as the election may indicate resignation or otherwise.

(j) In the event of the withdrawal, resignation or expulsion of any member of the voting board, or in the event that any such member ceases to be a grower, or in the event of any vacancy, the members in the district where such vacancy may occur shall hold a district election to choose his successor for the balance of the term.

(k) In all elections and ballots where the members vote directly, voting by mail shall be provided, and in the instance of elections, primary and final ballots shall be provided as above set forth.

9. The association shall create a membership fund out of the entrance or membership fees of $10 per member.

This fund must be retained in cash or in specified assets of the association representing an aggregate value equal to $10 for each member of the association.

10. (a) The association shall be organized by an organization committee, consisting of the board of directors and the board of trustees of the old association.

The organization committee shall begin an immediate campaign to secure signatures hereto, and shall continue the campaign to and through April 30, 1921.

(b) If by April 30, 1921, signatures of growers covering 75 per cent of the prune acreage of California shall be secured for this agreement, this agreement shall be binding upon all of the subscribers in all of its terms as to prunes.

(c) If by April 30, 1921, signatures of growers covering 75 per cent of the apricot acreage and 75 per cent of the prune acreage of California shall be secured for this agreement, this agreement shall be binding upon all of the subscribers in all of its terms as to apricots.

(d) If by April 30, 1921, signatures of growers of 75 per cent of the prune acreage or the apricot acreage of the state, respectively, shall not have

been secured, then the organization committee shall notify every subscriber at his address noted below and shall consider as cancelled the agreement signed by him in reference to only that fruit, either prunes or apricots, for which the minimum acreage has not been secured; or, if the minimum acreage of prunes is not secured, in reference to both.

(e) For all matters of acreage, or signatures; and for all statements of fact in connection herewith, the written statement of the organization committee, signed by the chairman and secretary of the board of trustees of the old association, shall be absolutely conclusive, with or without notice to the subscriber.

11. (a) Each subscriber who is not now a member of the old association agrees to pay to the organization committee, upon execution of this agreement, the sum of $10 for the membership fee of such subscriber, to be placed in the membership fund of the association.

(b) If the signatures of growers covering the minimum acreage shall not have been obtained by April 30, 1921, the organization committee shall return to such subscribers, not now members of the old association, the said sum of $10 originally paid for the membership fee.

12. (a) We do hereby authorize the organization committee, as the representatives of all the subscribers, to take such steps as it may deem proper to secure subscribers hereto, and when the adequate number is secured, to take all steps necessary and advisable to organize the California Prune and Apricot Growers Association.

The organization committee shall cause the voting board to be elected at the earliest possible date, and the voting board shall choose the directors for the first year as incorporating directors and shall cause them to incorporate the association.

(b) The association, when organized, shall make every reasonable effort to secure signatures of additional growers to the standard agreements, to cover the largest possible acreage of this state.

13. The subscriber, as a present member of the old association, expressly authorizes and agrees:

(a) That he shall be credited with a payment of $10 towards his entrance or membership fee, on account of payments heretofore made to the old association.

(b) That he shall be credited in the advance fund, hereafter provided, for the full face value of, or beneficial interest in, capital stock of the old association held or owned by him on January 1, 1922, over and above aforesaid $10 per person.

(c) That he shall be credited in the advance fund with the face value of any and all deductions made prior to January 1, 1922, for the purchase of common stock or retirement of preferred stock of the Warehousing Corporation, calculated cumulatively.

(d) That he hereby assigns, sells and transfers over to the association all of his interest in the California Prune and Apricot Growers, Inc., and agrees to surrender to the association his trustees' certificate, together with all of his interest in the capital stock of the old association, or in any assets thereof, and his claims against the old association, as and to any deductions made for the purchase of stock of the Warehousing Corporation or otherwise.

(e) That he authorizes and instructs the board of trustees of the old association to vote for and arrange a transfer of all of the assets of the old association to the association, for the value thereof, and to credit to the old association as part payment therefor such proportion of the transfer price as may be represented by all of its member stockholders, subscribers hereto, in the aggregate; and to pay all non-signing members or stockholders of the old association in cash for their respective interests prior to January 1, 1923; and to take such additional or other steps in reference hereto as may be required by law.

(f) That he authorizes and directs the trustees and directors of the old association to close out the business of the California Prune and Apricot Growers, Inc., as soon as the present contracts expire, and to dissolve the said old association at the earliest possible day.

14. The association shall create and maintain an advance fund.

This advance fund shall be the aggregate of the amount of the issued capital stock of the old association, less $10 per person deducted as already provided, and the aggregate value of assets developed from all deductions made for the purchase of common stock or preferred stock of the Warehousing Corporation prior to January 1, 1922, and of all deductions thereafter made for the purchase and retirement of preferred capital stock of the Warehousing Corporation.

Series A certificates, bearing interest at the rate of seven per cent per annum, shall be issued for and on account of the respective interests therein of the subscribers, members of the old association. The certificates shall be delivered to the voting board, to be held for the benefit and account of such subscribers until redemption, but interest shall be paid annually to the beneficial owners.

The Series A certificates shall be retired, as the directors may elect, generally, at the annual estimated rate of one-seventh of individual holdings and the aggregate amount of the entire Series A certificate, in the conclusive discretion of the directors.

The Series A certificate shall be so retired by the payment in cash of the face value thereof, with accrued interest.

The interest on all certificates shall be paid annually to the owners thereof.

For any or all deductions made for the purpose of retiring the said Series A certificates, every grower shall be credited cumulatively, and Series B certificates shall be issued according to such deductions for and on his account to the voting board.

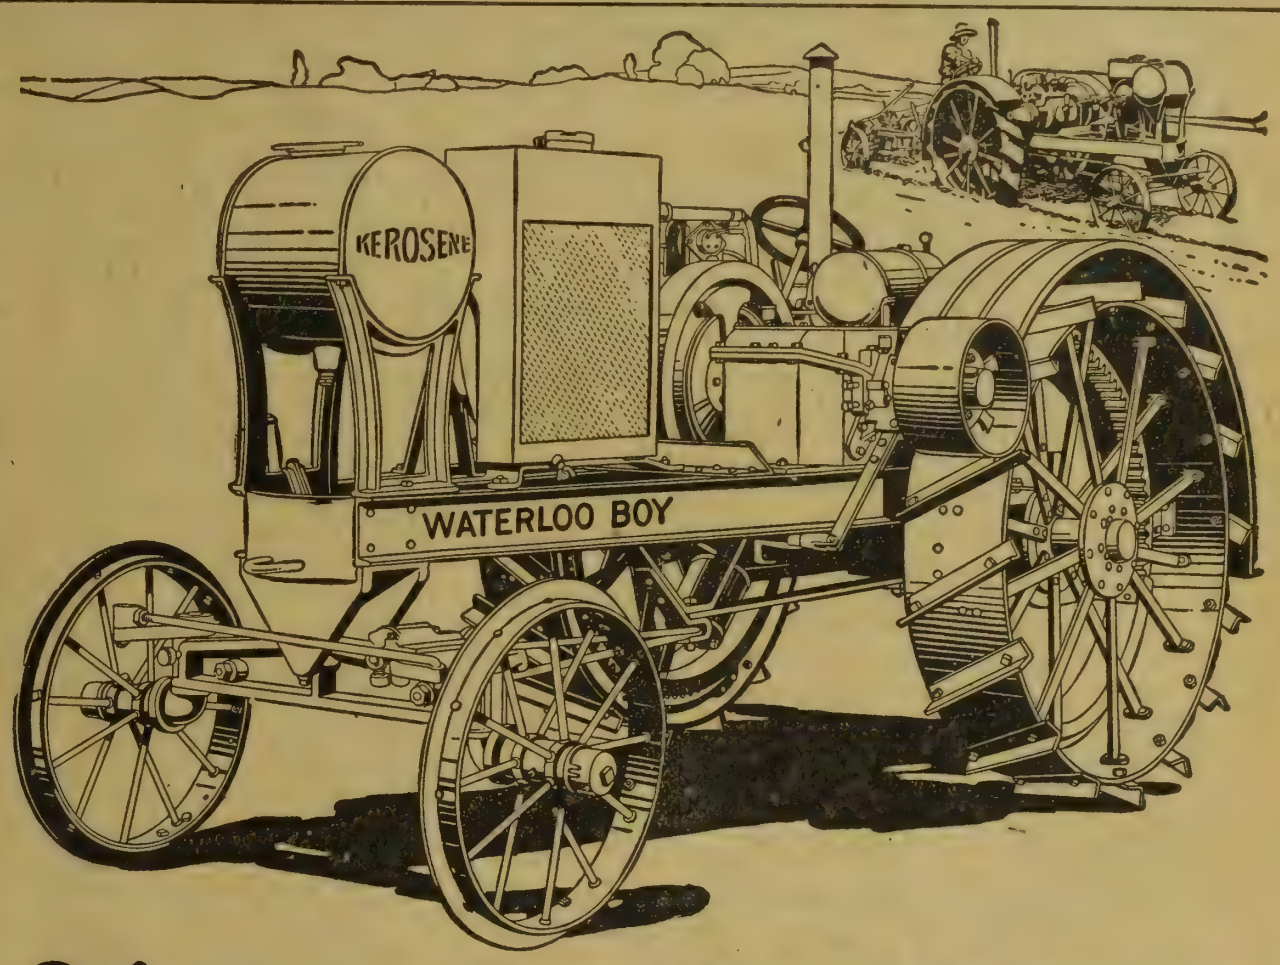
Said Series B certificates shall entitle each grower to seven per cent interest on the face value, and shall further entitle him to such proportion of the face value of the advance fund as each certificate bears to the total issued and unredeemed certificates.

The said advance fund must not be distributed except for payment of Certificates Series A, and replacement by deductions and issuance of Certificates Series B, as long as there are any outstanding liabilities of the association over and above the amount of the membership fund.

The said advance fund shall otherwise remain intact. If the members do not elect to continue cooperative marketing hereunder, at the end of the seven years period, the directors, with the consent of two-thirds of the voting board, shall sell the assets of the association and, after deducting and retaining the entire membership fund for distribution equally by membership, shall distribute the proceeds proportionately to the owners of the certificates then unredeemed.

15. All members of the old association not signing this agreement shall have the value of their respective interests in the deductions calculated as of January 1, 1922, and shall be paid in cash therefor on or before January 1, 1923, without interest.

16. (a) The subscriber agrees (1) execute, when requested by the association, a marketing agreement in terms substantially the same as those set forth in the agreement herewith



9 Acres a Day for 42 Days

IN the big things and the little things that make for tractor efficiency, you can count on the Waterloo Boy. When the owner of a Waterloo Boy starts out in the morning he knows his tractor will do his work the way he wants it done, finishing the day as strong as when it started. And he knows his tractor will keep on doing the same thing, day after day, week after week, always responsive in meeting the requirements of economical work.

WATERLOO BOY
KEROSENE TRACTOR

This confidence in Waterloo Boy ability has been brought about by real field performance. For instance:

A farmer living near St. Thomas, N. Dakota, owns four Waterloo Boys. His name is Ray Huffman. Last fall his Waterloo Boys plowed 1,520 acres in forty-two days—nine acres per day for each tractor. And he was plowing seven inches deep. That meant dependable service, the kind that counts most.

Mr. Huffman's four Waterloo Boys burned 2,470 gallons of kerosene in plowing his 1,520 acres, or an average of only 1.6 gallons per acre—a remarkable showing, but not unusual for a Waterloo Boy. This is the sort of economical power that appeals to farmers who want their work done well at small cost.

Ask your John Deere dealer to drive out a Waterloo Boy. Watch how it handles your own drawbar and belt work on your farm, under your conditions. Drive it yourself. Then you will know why Waterloo Boy owners are satisfied with their power investment. Write to John Deere, Moline, Ill., for a booklet, describing the Waterloo Boy. Also ask for Better Farm Implements, a 114-page book giving description, care and operation of the full line of John Deere tools. It's free. Ask for package WB-46

JOHN DEERE
JOHN DEERE MOLINE, ILL.

embodied, or (2) at the option of the association, to be bound by the terms of the following marketing agreement.

For such purpose signature to this association contract shall be deemed to all effects the same as signature to the said marketing agreement and as acceptance of each and every provision thereof and herein, as of the date of the exercise of such option by the association. Notice thereof shall be mailed to each subscriber at his address as noted below.

(b) The subscriber here applies for membership in the association when organized and expressly agrees that his signature to this association contract and to the marketing agreement, herewith embodied, and to this application for membership, shall be irrevocable, and that he so agrees, in order to induce other growers to sign this agreement for his benefit as well as their own general benefit and the public welfare.

Acceptance of this application for membership and of the marketing agreement shall be deemed conclusive upon the mailing of the notice by the association, and such mailing and notice shall be conclusively established by the affidavit of the secretary of the association.

* * *

As a part of the membership agreement the entire marketing agreement is used. This consists of 18 paragraphs or specific agreements and is made up of details as to fruit, methods of delivery, manner of pooling, making other disposal of fresh fruit, sale of orchards, mortgaging crops, breach of contract, and other conditions.

* * *

These provisions are subject to minor modifications or amendment by the organization committee, on the suggestion of the corporation commissioner, or otherwise, so as to carry out the general purposes hereof, or to conform to the provisions and privileges that may be embodied in any act providing for federal incorporation of cooperative associations enacted prior to July 31, 1921.

It is expressly agreed that this instrument is one of a series substantially identical in terms. All such instruments shall be deemed one contract for the purpose of binding the subscribers, to the same extent as if all of the subscribers had signed only one such contract.

* * *

Field Manager Dunlap, with Wm. G. Alexander and A. Kammerer, directors of the association, started on January 2 for a month's tour of prune and apricot growing counties of the state, where they will hold mass meetings to inform growers as to the new contract. Meetings will be held:

January 15, at Hollister, 2 p. m.; Morgan Hill, 8 p. m. 17, Hanford, 2 p. m.; Visalia, 7:30 p. m. 18, Kingsburg, 2 p. m. 19, Saratoga, Foothill Study Club House, 2 p. m.; Evergreen, School House, 8 p. m. 20, Sunnyvale, Stowell Hall, 2 p. m.; Willow Glen, school house, 8 p. m. 21, Oakley, Mercantile Hall, 2 p. m.; Walnut Creek, Judge Duncan's court, 7:30 p. m. 22, Watsonville, Auditorium, 2 p. m.; Oak Grove, school house, 8 p. m. 24, Redlands, Chamber of Commerce building, 10 a. m.; Banning, basement of Baptist Church, 2 p. m.; Hemet, basement of library, 7:30 p. m. 25, Nuevo, Community Hall, 9:30 a. m.; Elsinore, Fraternal Brotherhood Hall, 1:30 p. m.; Santa Ana, City Hall, 7:30 p. m. 26, Ontario, Chaffee High School, 2 p. m.; Van Nuys, high school, 7:30 p. m. 27, Moorpark, Community Church, 9:30 a. m.; Santa Paula, City Hall, 2 p. m.; Ventura, City Hall, 7:30 p. m. 29, Centerville, Anderson Hall, 8 p. m. 31, Hayward, Dania Hall, 8 p. m.

Raisin Crisis

The people of Central California face today a crisis.

By order of the department of justice of the United States, agreed to by stipulation of the attorneys for the California Associated Raisin Company, the contracts under which the cooperative organization of raisin growers is operating are outlawed, and this association must obtain new contracts if it is to continue to serve the people for the season of 1921 and following.

This cooperation is the one thing that must not fail. We cannot permit the association of California raisin growers, brought to a full usefulness after 20 years of struggle, to lapse because of incidental legal objections that have no bearing on the essential character of the association. We nave not gone through 20 years of communal battle against the forces of disorganization and of antagonistic marketing corporations, to be defeated as a community of raisin growers through one reversal.

We know that the union of raisin growers cannot be accomplished with any 60 per cent association. We should have a 100 per cent cooperative body. We have not been getting along any too well with a 90 per cent organization. The cooperative character of the association would virtually disappear with only a majority of the acreage of raisins held in one company. The old system of cutthroat prices, of jockeying the market, of gambling with other people's raisins, would be restored. The same dependence of the dried grape man on the uncertainties of the market would recur as we have now in the green fruit market.

It is for the raisin growers of California to say that these times shall not return. They must all say it, if the danger is to be met. We have been accused of coercing unwilling growers into our association. Let us now show the world that we all, as raisin growers, demand an opportunity and a right to enter an association.

We shall expect of the directors of the California Associated Raisin Company that they present to us, on February 1, a contract that shall meet the legal objections raised by the department of justice. But we shall demand that a new contract give us all—every man and every acre of us—a chance to cooperate for the preservation of our interests as raisin growers.—Fresno Republican.

NATIONAL ORANGE SHOW

The management of the Eleventh National Orange Show, to be held in San Bernardino, February 18 to 28, writes that it is planning to make this a show which will fully live up to its slogan of "California's Greatest Midwinter Event." It is planned to have more citrus fruits on display than ever before. Nature has smiled on the exposition and has aided in this, for Southern California has one of the largest orange and lemon crops in years. There is more fruit on the trees, therefore there will be more fruit in the show.

Among the communities and organizations which have already made application for feature displays are the following: Sacramento chamber of commerce, Fresno chamber of commerce, associated chambers of commerce of the San Gabriel Valley, Redlands chamber of commerce, Ontario chamber of commerce, Rialto chamber of commerce, Orange County, California Fruit Growers Exchange, Mutual Orange Distributors, Elephant Orchards, Pacific Electric and the Santa Fe.

Citrus Institute

The annual California Citrus Institute will be held during the Orange Show again this year, an interesting program with prominent speakers having been arranged. Among the topics to be discussed are: "Control of Insect Pests in Citrus Orchards," "Traction Power for Citrus Orchards," "Status of the Citrus Industry," and "Transportation of Citrus Fruits." Among the prominent speakers will be G. Harold Powell, head of the California Fruit Growers Exchange; J. A. Prizer, fumigation expert; H. S. Smith, scale control authority; Don Francisco, advertising manager for the California Fruit Growers Exchange; D. E. Huff and W. H. Fleet, grove cultivation experts.

The tractor you've waited for

5-TON Tractor

narrow
low-down
light-weight
versatile
dependable
long-lived

There's only one Caterpillar **Holt** builds it

You've formed your ideal of a tractor that will exactly meet your requirements—you who haven't needed as big or powerful a tractor as "Caterpillar" 45 or 75. You've wanted a smaller tractor, but not the *ordinary* small tractor. You've wanted liberal power, absolute dependability, low operating and upkeep costs—above all, you've wanted a long-lived tractor. You've wanted, in short, a small tractor of the quality of design and workmanship that can be found only in Holt products, and you'll find your ideal in the "Caterpillar" 5-ton Tractor.

Perhaps you realized this when you heard of 5-Ton's achievements in war and peace-time work on two continents. Perhaps you determined then to wait until this tractor was available for delivery in this territory.

But if you hayen't investigated the 5-Ton, if you aren't already familiar with its detailed points of superiority, investigate it without delay. For a time, at least, only a limited number of "Caterpillar" 5-Ton Tractors will be available for delivery here. You must act promptly to secure immediate or early delivery. Write, phone or call at the nearest Holt branch or agency.

Cooperation---Make It a Slogan

By M. A. Jumper

WHEN the manufacturer of an automobile, baby carriage, cream separator, or whatever it may be, has his article ready for sale, after figuring cost of producing, labor plus profit, it is put on the market at so much per—take it or leave it! If you cannot pay his price for the automobile you simply continue to travel along behind the old grey mare. The retailer who sells that article, sells it at a set price, making his commission, of course.

But how about the farmer? What would the manufacturer say if, after producing his article, a jaunty individual tripped up to him and exclaimed: "I am a buyer. I will pay you so much for a carload of your baby carriages. Rush out a carload, as the price is going down every minute." And suppose this manufacturer did as he was directed by this middleman and in a month saw his product on the market selling for almost twice what he received for it, what would happen? Baby carriages would become extinct! The manufacturer would have to go out of business.

How about the farmer? We might get along without baby carriages, but could we get along without the products of the farm? It is the farmer who produces the world's four big commodities, wheat, corn, cotton and wool. We must have these four things. Yet in no way is this great producer protected, or even encouraged, to try it again.

If the manufacturer does not get enough for his product he goes out of business. If the workingman does not get enough pay for his labor he strikes! Yet the farmer goes on year after year, worrying whether he can pay for his winter's coal or not, being the "goat" of Wall Street and the middleman. Possibly the human element in the farmer may some day assert itself, and he may go out of business—or strike! What then about you and me?

It behoves the country to sit up and take notice. It behoves the farmer to cooperate. Cooperation is the only feasible means of bringing the farmer into his own. Of course the government might take a hand and set a price each year on cotton, wool, wheat and corn. The government might even abolish stock gambling in foodstuffs—but in the meantime cooperation is the thing. We have proof substantial of what cooperation will do for the farmer in the Raisin Growers Association of California.

In California in every agricultural community is seen the beginning of cooperation in the home farm bureau. A fine thing, it should be encouraged more than it is. We are too apt to criticize the head of the farm bureau, possibly, to others. That is not cooperation. If you do not like the way he is running the thing go and tell him so: that is your privilege if you belong to the association, and you should if you are a farmer. If he is making mistakes, go tell him so and with your cooperation try to rectify those mistakes. No one is perfect!

The wheat growers, corn growers, those who raise cotton and wool, all are forming associations or have formed them. What they need is the farmer's cooperation. Stick together! Don't be scared out by a convincing middleman who tells you the prices are dropping every minute. That's his line of talk; talk is his stock in trade.

If the cotton growers will stick together and hold their cotton they will get a fair price for it. Why should they not? They planted their cotton, raised it under the high prices. They paid the high price for having it picked. Not only the farmer but the public in general will suffer for all the cotton left in the fields unpicked. Possibly next spring there will be a cry that cotton goods is high because the farmer would not pick his cotton. Possibly the verdict of the public would be "Mean farmer."

The tire manufacturer who buys long staple does not want to lose. Of course! He is human! Well then, let the farmer show he is human too! Show the world that the modern farmer is a business man. Show the world that the bewhiskered individual so long cartooned is the chrysalis from which has come this modern business man who has a production to sell at so much per, "Take it or leave it." That can be done with cooperation, for as the raisin growers take care of their members in a crisis, so could the wheat growers, cotton growers, corn growers, or producers of wool.

The Pocket Gopher

By E. L. Koethen

The extreme prevalence of the gopher at the present time causes it to be a peculiarly timely subject for discussion. We have never seen them so plentiful before as they are now. Many reasons have been suggested to explain this, but we think that the suggestion that it is because of the lack of drenching rains for several years is the most plausible reason given.

Our farm bureau recently announced that a demonstration of gopher fighting would be held at a nearby orchard. As we drove to the place we wondered what "that young fellow would be able to tell an old gopher hunter about gophers." We knew some of the things he told, namely, that the animal was solitary in its habits during the most of the year and that at the mating season they work in pairs. We knew that they throw up the mounds at a distance of from a foot to 18 inches from the main runs so that the main runs may be located by observing the location of the mounds; that they have two sets of runs, one at a shallow depth and the other some inches deeper; that they carry food and cache it in chambers, mainly in the lower runs. We knew that poison was the most effective method of getting the majority of the beasts, to be followed by trapping in order to make a cleanup. But there were some things that we did not know, some things that are new enough in their discovery to warrant them being given here.

In the first place we were told that in making the mounds the animal pushes the soil out in a fan shaped mound and that the point of the fan indicates the location of the run. As poison should be placed in the main run this is important. It saves much work to know that the run can be found easily. The operator uses a pointed steel rod with a step attached to the side, which enables him to push it down with the foot in probing for the run. His method is to find the run in this way and place poison in the runway by dropping it in through the hole made with the probe.

The location of the runway is determined with certainty, as the probe drops readily into the open space after the surface has been punctured; then it is wiggled sufficiently to leave a hole open when it is removed. This will be large eneough to drop the poisoned bait in.

The bait is prepared in this way: Saccharine is used to disguise the bitter taste of the strychnine, powdered strychnine being employed. For bait such material as carrot, sweet potato, apple and parsnip are used. In order to make a piece of bait too large for the gopher to put into his pocket to carry to his lair, it is cut into pieces from one inch to an inch and a half long, and rather small in width and breadth, say not over a quarter of an inch. This is done that the bait will fall readily into the hole to the runway. The powdered poison is sprinkled over the bait and mixed well so as to make a complete covering. It is now ready for use.

The orifices are readily made and the placing of the poison is so quickly done that a large tract can be gone over very quickly. In a few days the

territory is gone over again, and wherever new mounds are made the poison is reset. This is repeated until nearly all the vermin are eradicated. After that traps may be resorted to in order to secure the wise ones that will not take the bait.

RECLAMATION WORK ACCOMPLISHED LAST YEAR

A summation of the work of the U. S. reclamation service to the beginning of the fiscal year July 1, 1920, shows it has dug 12,663 miles of canals and ditches, and excavated 95 tunnels with an aggregate length of more than 27 miles. Dams of masonry, earth, crib and rockfill have been erected with a total volume of 13,827,295 cubic yards. The excavations of rock and earth amount to 179,000,000 cubic yards. The government has used 3,015,000 barrels of cement. The available reservoir capacity is 9,441,910 acre feet. The service has built 7,293 bridges with a total length of over 32 miles. Its culverts number 9,400 and are over 61 miles long. There are now in operation more than 512 miles of pipe line and 129 miles of flumes. The service has built 986 miles of roads, much of it in what was before inaccessible mountain regions, 83 miles of railroad, 3,146 miles of telephone lines, 650 miles of power transmission lines, and 1,450 buildings, such as offices, residences, power plants, pumping stations, barns, storehouses, etc. The power developed amounts to approximately 60,000 horsepower.

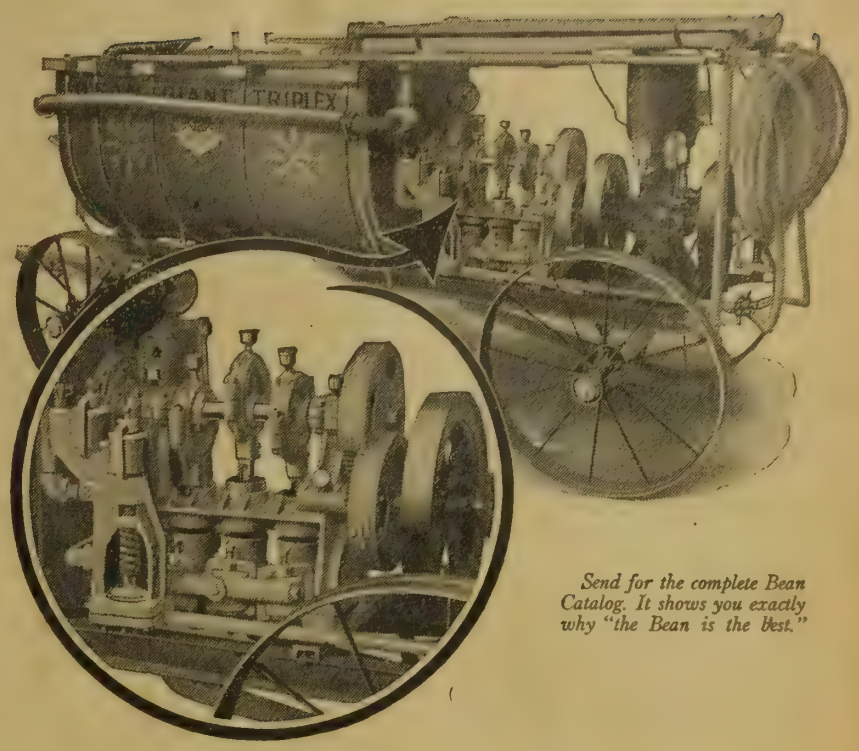
The net construction cost of the reclamation projects to the end of the fiscal year 1919 was a little less than $125,000,000.

The projects now under way or completed embrace approximately 3,300,000 acres of irrigable land and will ultimately provide about 60,000 farms of from ten to 160 acres each. During the year 1919 water was available from government ditches for about 1,636,000 acres on 39,000 farms, of which about 1,200,000 acres were irrigated; in addition water was supplied under contract for about 1,000,000 acres outside the government projects. The value of the crops grown in 1919 on lands served either in whole or in part from the works of the service amounted to $150,000,000, about $89,000,000 of which represents the value of crops grown on the 1,113,469 acres of cropped land on the projects proper, from which definite crop statistics are secured, or about $80 per acre, and the balance an estimated amount from approximately 1,000,000 acres of land served with water under the Warren Act from the works of the service.

BEET GROWERS ORGANIZING

The beet growers of California, more especially those of the southern part of the state, under direction of State Market Director Daniels and Farm Adviser Wahlberg of Orange County, are taking steps to form an association. An organization committee composed of the following named well known beet growers of Los Angeles and Orange Counties has been named: D. H. Goodwin, W. A. Draper, C. J. Smith, W. D. Johnston, Mr. Koch, J. A. Knapp, Earl Gardner, M. Chuml, J. W. Martin, J. W. Seay, Geo. C. Buehn, C. L. McComber, Sam Geizler, R. B. Marshbank, H. B. Woodrough. Mr. Goodwin was named chairman and Mr. Knapp secretary.

The university farm is exhibiting field crops in the state exposition building, Exposition Park, Los Angeles. Each specimen consists of a sheaf and a sample of thrashed grain, accompanied by a placard giving its history, soil and climatic adaptation, culture, yield records at Davis, and utilization. The collection includes the following varieties: White Durra, Select milo, Hybrid feterita, feterita, Spur feterita, Brown durra, White milo, Brown Kaoliang, Red kafir, Black Hulled White kafir, White kafir, Red Amber, Orange sorghum, Honey sorghum, Early Amber, Dwarf broom corn, Standard broom corn, Brackets Black Hulled Kaoliang, Shallu, Sudan grass, Harding grass, San Diego grass, Club wheat, Baart wheat, Sonora wheat, Bunyip wheat, Turkey Red wheat, Defiance wheat, White Australian wheat, Hard Federation wheat, barley, Red oats and Burt oats.



Send for the complete Bean Catalog. It shows you exactly why "the Bean is the best."

The Heart of the Sprayer is the Pump!

Your sprayer is just as good as the pump that's on it—*and no better*! Every drop of liquid that goes onto the trees is taken from the tank and delivered to the nozzles at tremendous pressure—*by the pump.*

There are 36 years of experience built into every Bean Spray Pump. Bean Porcelain-lined Cylinders, the Bean Pressure Regulator, Bean Threadless Ball Valves, Bean Eccentrics, Bean Cup-shaped Plungers [which require no stuffing boxes]—these and the many other Bean advantages are not the result of a day! They represent the work of years!

Here and there you will see a Bean feature copied, but in no other sprayer will you find *all* of these superiorities built into a single pump—for most of the vital improvements are patented and protected against infringements.

Send for the New Bean Catalog

It illustrates and describes the entire Bean line from the Bean Magic Hand Pump and the Bean Simplicity, the new one-man power outfit, to the powerful Super-Giant, the outfit for large orchards, where great capacity and very heavy pressure is required.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tree Toads

I would appreciate it very much if you will tell me how to get rid of small frogs that make a good deal of noise at night and keep us awake. They have only come during the past year and each month are getting worse. I caught quite a number last summer in large fly traps the same as we catch flies. There is a good deal of shade and moisture around the house, which I do not want to take away, as we want shade in summer and flowers, and both trees and flowers require irrigation.—Subscriber, Anaheim.

We imagine these small frogs are tree toads, little fellows not much more than an inch and a half in length, with small, almost transparent membrane, or sac, underneath the chin with which they are able to produce a "song" which some people enjoy and others detest. Personally, we rather like the woodsy effect and find that a goldfish pond in the garden attracts them. This, however, was not acceptable to some of the neighbors, so, knowing other neighbors farther away were anxious for a supply, a little electric flashlight made it possible to gather in a good big collection in one evening, all of which were duly delivered to the neighbor who wanted to stock up. One will soon learn so that he may quietly visit their haunt, and if a quick, deft movement of the hand is made soon after the light is flashed into their eyes they may be picked up, canned and delivered to some other admirer, or, if preferred, at some far away stream or water hole. Some do not like the feeling of the "critters" to the hand and others fear that there is danger of warts, but there has never yet been an authenticated case of warts from handling them, and the feel is all in getting used to it. Also, bear in mind that the ordinary garden toad, one of the most beneficial adjuncts of the garden, does not make this noise, so in gathering up the toads be sure and leave the large or garden toad. He has a neighborly little croak, but never the song which the tree toad or the little fellow who is only about an inch or an inch and a half long has.

Tubercular Meat

Is meat fit for human consumption after the animal has been pronounced tubercular by a county inspector? A county physician claims there is no danger in eating the meat. I have read that such meat was of a pinkish color and was dangerous, as the disease could be contracted by eating the meat.—Subscriber.

Meat from tubercular animals may or may not be fit for human food. If pronounced safe by inspector or physician it probably is all right. As a rule tubercular animals are affected only as to lungs or the vital organs. There are cases, however, where the tubercles are all through the muscular tissue. In such case the meat is only fit for fertilizer. The pinkish color is not necessarily indicative of tubercular meat.

Slugs or Snails

We are bothered with slugs and would like to know of some way to get rid of them other than getting up at night and putting salt or chloride of lime on them.—Subscriber, Anaheim.

Surrounding plants with a ring of air slacked lime and liberal use of this lime about them is practically the only control of this pest other than the night work and gathering them up and destroying. Where they are numerous a bellows may be used to blow the lime dust over them. Your salt method is all right once you catch your pest and sprinkle it over him, but poking into a pan with stick is quicker. Where they are present in large fields freshly ground lime is scattered over the field at the rate of 25 to 30 bushels per acre. Instead of lime some use tobacco dust, nitrate of soda, blue vitriol in a three or four per cent solution, and kainit. One advantage of this blue vitriol solution is that sticks or branches which are covered with it cause the death of the snails as readily as if sprayed over the body. Even a small cord steeped in the blue vitriol solution and laid around the plants is a most effective guard from the pests. Common gypsum freely scattered about is likewise a good remedy. As Bordeaux mixture is composed in part of copper sulphate, or blue vitriol, liberal spraying with that has proven helpful. One gardener has recommended common insect powder mixed with soft soap and warm water, thoroughly stirred and sprinkled about places frequented by the slugs.

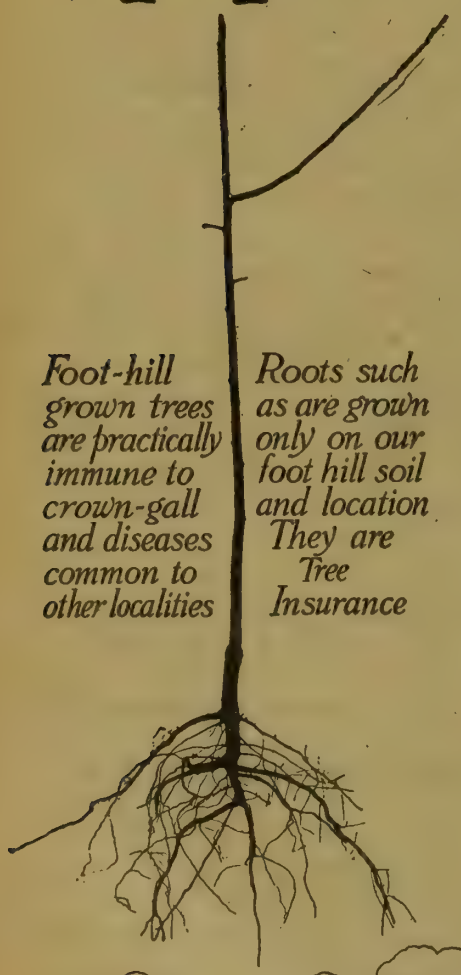
Persimmons

Would like to know about persimmons. What kind of soil do they require? How much irrigation? The best variety to plant? Would they be profitable to plant in Orange County?—Subscriber, Orange.

Persimmons are successfully grown in all sorts of soils in the southern end of the state, but it is believed they do better in light soils of good drainage. The more popular variety locally seems to be Hachiya, as it is the largest. Hyakume and Tamopan are both good. The heaviest crop of medium sized fruits the writer has seen were on two trees of Costata in a private garden at Ontario, San Bernardino County. Dai Dai Mara, Yemon and Tane Nashi are standard commercial varieties. A few of the Gailey are generally planted in orchards for pollinating the others, for larger crops result with all varieties where Gailey is present. We cannot advise you as to persimmons proving profitable, but the outlook is very good.

Your golden opportunity

THE SILVA-BERGTHOLDT CO. CALIFORNIA FRUITS NEWCASTLE, CAL. TRADE MARK REGISTERED



Foot-hill grown trees are practically immune to crown-gall and diseases common to other localities

Roots such as are grown only on our foot hill soil and location They are Tree Insurance

Commercial Horticulture is paying the California grower threefold more in wealth each year than was produced in any one year by the pioneers of '49 during the palmiest days of gold mining.

Your investment in planting a commercial orchard today, insures your income for the future.

A vast acreage of fertile lands are now employed in unprofitable farming of grain, hay, livestock, beans, etc., that can be more profitably employed in Commercial Horticulture.

Now Is the Time to Plant

Prunes, Pears, Plums, Clingstone Peaches Freestone Peaches, Apples, Cherries, Apricots, Almonds, Walnuts, Grapes, Olives

All are foothill grown trees, with a reputation for making good that no others can equal.

Trees are 85 per cent sold out. Submit today a list of your tree wants, for prices, while our assortment is still complete.

Changing Contract

Husband and wife hold property deeded to them as joint tenants. Can the words "with right of survivorship" be written in in the presence of notary or by going to the trust company who executed the deed and made the deed valid?—Subscriber, Bonsall.

If an alteration is made with the consent of all parties, it merely makes a new contract. A deed is a contract just as all other agreements between parties are. However, if the deed has been recorded the copy in the recorder's office is prima facie evidence of the contents of the deed and the change made in the deed after recording would doubtless require explanation, which might be difficult to make. If a change is desired to be made in the deed, the only safe method is to

execute an entirely new deed and have such new deed recorded. It is quite probable that the words desired to be written in are unnecessary, but it is well to have them inserted.

Boy Not Adopted

Husband and wife have no children. They took a boy from a state home, raised him without adoption, but under contract with the home. They desire the boy and his heirs to have the ranch upon their death. What is the best way to convey the property so as to avoid probate? Can it be done by giving a deed or escrow or in some other manner. Would such deed make it possible for the owners to dispose of the land if they desired to sell?—Subscriber, Turlock.

It is true there are many ways of avoiding the probate, but they are fraught with considerable danger of subsequent litigation. It is far more expensive and troublesome than are the laws of the probate courts which have been established out of the wisdom and experience of the ages. A deed can be executed and the parties owning the property deliver to a third party to hold until the death of the grantors. Such deed and any interest in property conveyed would be avoided by any transfer of the property. The question invariably comes up as to whether there was a legal delivery, and as to terms of the contract under which the third party holds. As the boy is apparently a legal heir, the next of kin of the husband and wife would have the right to take administration upon the estate in case there was no will. Such administrator would have the right to the possession of the personal property and funds in bank, thus being possessed of the funds needed for litigating with the boy. The best and safest method in such a case is to legally adopt the child; make a will in his favor for the property which is desired to give to him, and appoint him, if he is of legal age, as the executor of the estate.

Leaving Property to Wife

A couple have several children, only one of whom is a minor. It is desired to leave all property to the wife if she survives. If a will is made must something be left to the children in order to make the will valid? Is it possible to arrange the estate in such a way that the wife can have the property without probate proceedings or other expense?—Subscriber, Lodi.

It is not necessary in the will to leave anything to the children, but they should be named therein and a distinct statement made that nothing is left to them. Otherwise, the law will presume that the testator in making his will had overlooked the children and the child overlooked would be entitled to such portion of the estate as he would have received in case there had been no will. It makes no difference in this respect whether the child is a minor or not. There are methods by which administration is avoided. They are exceedingly dangerous for a person to take without the consultation or advice of an attorney who is fully conversant with the facts in each case and it is not advisable in case of any complications to undertake such steps in any event.

Paying for Fence

I am fencing my five acres with a five foot fence. My neighbor has his fenced with a two foot fence, except a line fence which is fenced only one-half way and that in very bad condition. Can he be made to pay for half of the new fence?—Subscriber, Roscoe.

It would doubtless be true that he could be required to pay one-half of the cost of constructing a new fence.

FAIR WARNING

"Nigger," warned one, "don't mess with me, 'kase when yo' do, yo' shuah is flirtin' wid de hearse."

"Don't pesticate me, nigger," replied the other, shaking his fist. "Don't fo'ce me to press dis upon you, 'kase if I does I'll hit yo' so hard I'll separate yo' from amazin' grace to a floatin' opportunity."

"If yo' mess wid me, nigger," cried the first, showing the whites of his eyes, "I'll jes' make one pass and dere'll be a man pattin' yo' in de face wid a spade to morrow."

Built to an ideal and not to a price

The great quality limitation of the average pump is its price. Before the first casting is made its life usefulness is pre-determined by *price*.

Byron Jackson has become synonymous with quality because it has been the policy of this Company through the years to reverse this procedure.

Every pump, whether special or standard, is built to the ideals of quality, efficiency, dependability and economy. Then, and only then, is price computed.

MY SON A MAN

He has grown into my world; he is a man,
My son, an equal of the men I know,
The women with whom I talk and laugh and plan.
How shall I make him now my friend? They say,
These other mothers, that their sons outgrow them
And are amazed because they do not know them,
But find their son a stranger—or a foe.

The boy in him will always for the sake
Of Motherhood revere me; but to make
The man in him acknowledge me and give
Me glimpses of the way he means to live
And why—his dreams, his hopes, ambitions, creed—
How can I make him know me not a mother
Alone, but comrade, friend, like any other?
I must win the friendship of this man anew.

Patiently tactful, wait, as mothers do,
Not smother him with what he does not need;
Not burden him with my anxiety,
My worry for him; but have faith that he
Can order his life well apart from me
Then, equals, we may strive to understand
Life's puzzles, not a part, but hand in hand.

—Mary Carolyn Davies.

HOW DICK SHOOK DOWN THE JAIL

"Why, of course, my dear boy! What else could be done? If the front has sunk down, it stands to reason that it must be raised in order to get the whole building level."

"And the cost of all this " asked Steve, who until this moment had not uttered a word.

"Five thousand dollars at least, according to Corrigan's estimate, and of course the old building isn't worth spending that much money on. Shucks!" he aded after some moments of thought. "I suppose in some ways it would be better to tear the old hulk down tomorrow, before somebody is hurt. Yet I hate to see it go, for it was in that building I started in business."

"Col. Smiley," said Dick earnestly, rising to his feet, "if—if—you'll trust me so far as to give me the chance, I will straighten the old jail for you as well as Corrigan could straighten it, and it won't cost you anything like five thousand dollars."

Col. Smiley stared in astonishment at his young visitor, and even Steve, who had had some inkling of the scheme, gazed open-mouthed at his friend.

"Impossible—impossible!" the colonel said, with a tolerant smile. "I admire your courage, Dick, but of course a young boy like you could not accomplish what a trained expert cannot accomplish. Besides, even if you had hit upon a new method for raising a building, you haven't the capital. Why, when I was interviewing Mr. Corrigan—it was at the time he was moving the university building—I was amazed at the great number of beams, blocks, jackscrews and engines he had on the work. I asked him their value, and he said, 'Forty thousand dollars,' as if he were talking about forty cents. No, no; you couldn't do it."

"Col. Smiley," said Dick, "you gave a talk at school last winter about the main ideas of great inventors and about the value of thinking in an original way."

The colonel smiled. He enjoyed his lectures as much as his audiences did —sometimes more. He was well pleased that Dick should have remembered this one.

"You told us about Hargreaves, the inventor of the spinning jenny," Dick went on. "You said, I remember, that his family spun so much thread with the new machine—with the spindles vertical—that his neighbors declared him to be in league with the Devil and threatened to tear his home down. The idea was too radical for them."

"But what has all that to do with straightening the old jail?" asked the colonel, puzzled.

"Your idea and Mr. Corrigan's is that the only way to straighten the old jail is to raise the lower side. I'm going to be as radical as Hargreaves. I propose to lower the high side. I'm certain that it will work. I shall use weight to lower the building, and that weight will be in the building itself."

"Bless my heart!" the old gentleman exclaimed. "I never thought of that!"

"Neither did I," remarked Steve.

Col. Smiley ruminated deeply for a while; he seemed to have forgotten the presence of the two boys who sat before him. Presently he turned to Dick.

"But the building might crack in doing it that way, and the old rattletrap would tumble to the ground."

Dick smiled. "Didn't you say only a few moments ago, colonel, that it might be better to tear the old hulk down tomorrow, before somebody is hurt?"

The colonel laughed. "What a boy you are for calling up a person's words to him. Nevertheless, my purpose was to prevent anyone's being hurt, and I don't propose to let you go into any foolhardy experiment that might result in your being buried beneath tons of bricks."

"But if I give you my word of honor that no possible harm could come to me or to any helper, would you let me try? I don't promise, though, that the building will not be injured or even ruined."

"How do you propose to go about all this?"

"I'd rather not tell you, sir, if you don't mind. Come and look at the work as it goes along. How much time have you before the question of the new factory must be settled?"

"Two months, I figure."

"Before the end of those two months, colonel, your building will be straightened up."

"Or,," suggested the colonel, smiling.

"Or," added Dick, "you'll find the old jail sleeping in its own ruins."

"Good enough!" exclaimed the colonel heartily. "Go ahead, Dick. If you accomplish your task, Ill give you twenty-five shares of the Silverthorn factory stock and pay you five hundred dollars in money. And I wish you luck, my boy."

Early the next morning — it was Saturday—the boys set off for the old jail. Steve did not question his friend; for he knew from past experience that until Dick was ready to reveal his plans it was useless to press him to do so. When they reached the building, Dick unwrapped the bundle that he had carried and disclosed several wide-mouthed fruit jars. Four inches deep in each was a whitish sediment and on top of that a little water.

"These are the samples of earth you took out of the borings yesterday," he remarked.

"Yes, and I don't know yet what you wanted those few gobs of dirt for."

"If I hadn't found out what I did about those 'gobs of dirt,' I couldn't have offered to straighten the building." Dick thrust his hand into one of the jars, lifted out almost all of the white deposit and put it on the floor. "Now, Steve," he said, "double up your fist and press as hard as you can on this little mound of white mud. I want you to see how hard a cake you can make by pressing on it."

Steve pressed down upon it with his fist. "It won't cake," he said disgustedly. "The mud just squashes out between my fingers. What kind of game is this?"

"Just this kind of game," Dick replied. "We are going to make use of the squashing-out process. We're going to make mud of the ground on the high sides of this building, and the weight of the house is going to squash out the mud until the whole building stands erect—just as it stood a hundred years ago."

"Say, Dick!" cried Steve, "I'll have to hand it to you. I never imagined you had anything like that in your head."

After making some further preparations, the boys went home, bolted their breakfasts and, stopping only long enough to get their garden spades and to sharpen the edges on a grindstone, returned to the jail. Besides the spades, they brought a spirit level and a long straight-edge.

"Now, Steve, listen," said Dick." "We're going to dig a trench three feet wide all round the edges of this basement except along the front wall, which has sunk the deepest."

"How deep do we make this trench?"

"Exactly as deep as the lower edge

of the lowest course of bricks in each of the three sides. The bottom of our trench will run uphill as it goes toward the back wall, and you'll find the foot of the back wall about eight and four-sevenths inches higher than the foot of the front wall. This building is just like a box that's tilted up at the rear end."

"How do you know that the back wall is eight and four-sevenths inches too high? You can't tell until you dig down and find out, I'm thinking."

Dick gave a comical sigh. "And yet they say that in this great country education is as free as air."

"I'll punch your head," replied Steve, with a grin. "Straightening old buildings is a subject I don't happen to have studied in school."

"Well, you can begin now. The front of the building—or box — is twenty-eight feet tall and overhangs six inches. Now, the side walls are forty feet long. It's perfectly plain that, as twenty-eight feet are to six inches, so are forty feet to X, or the answer. That answer is eight and four-sevenths inches."

"Simple enough," remarked Steve. "And we are going to let in water to a trench that runs downhill, in the hope that it will set the old jail on her feet. Maybe it will, and maybe it won't."

"No, we're going to make another trench for the water; and then we shall see the rear wall go down a little more than eight and a half inches and bring the side walls down proportionately along their entire length. Steve, it's as easy as eating."

The boys worked hard all that Saturday, and by dusk had finished their trench. To find the bottom course of bricks they had to go down eighteen and a half inches near the front wall, showing that, if Dick's figures were correct, the walls had originally been built ten inches below the level of the basement. The trench along the rear wall was almost exactly ten inches deep.

On Monday evening Steve came over to Dick's house, and the boys laid their plans for their work during that week. Flush with the side and rear walls of the building, they were to dig, in the floor of their three-foot-wide trench, another trench. The objects of this king trench, as Dick called it, were three: first, to expose the exact depth of earth to which they wished the three walls to settle; second, to form a gutter to hold the water that was to turn the earth under the wall into mud; third, to give that mud some place to go after it had "squashed" out.

Along the back wall the king trench was to be eight and four-sevenths inches deep — the exact number of inches that this part of the structure needed to be lowered. It was to be eighteen inches wide and as level from end to end as the boys could possibly make it.

"Why make it so wide?" asked Steve.

"Because we must have room to work braces and bits," Dick replied. "You see, we'll bore one inch holes every six inches along the outside of the king trench. The holes will give the water a better chance to turn the earth under the brick walls into mud."

The king trenches along the side walls were to be, of course, eight and four-sevenths inches deep also, where they left the rear trench; but since the bottoms of all the king trenches were to be level, those at the side

TEN DOLLARS WILL SAVE A CHILD

SIX days each week, three million five hundred thousand children suffering from intense hunger, bitter cold and disease, gather around the 17,000 asylums, hospitals, clinics and public kitchens maintained by the European Relief Council in Eastern and Central Europe to receive what in many cases is the only food they ever get.

These children are given one meal a day, six days a week. The feeding does not take place on Sunday as six days constitutes a "feeding week" and life can be sustained on that basis.

The children get hungry on Sunday but they do not eat on Sunday, and unless the necessary money is secured to continue the present child feeding program they will not eat on Monday, or Tuesday or any other day of the week, but will be left to die of starvation.

To give the 3,500,000 children a ration which is balanced to make up the fat and starch content which their bodies require, it is necessary to furnish them every week about 82 tons of cocoa, 232 tons of sugar, 770 tons of condensed milk, 1,716 tons of flour, 537 tons of beans, 420 tons of rice and 187 tons of lard. Every week for 34 weeks these amounts of food must go to these children or they die. The total cost, for the 34 weeks of feeding, during which period 134,096 tons of plain food will be distributed, will be $23,000,000 and an additional $10,000,000 will be required for medical service.

For the purpose of providing funds for the relief of the 3,500,000 starving and diseased children and to administer the relief economically, the European Relief Council, consisting of the American Relief Administration, American Red Cross, American Friends' Service Committee, Jewish Joint Distribution Committee, Federal Council of the Churches of Christ in America, Knights of Columbus, Y. M. C. A. and the Y. W. C. A. was recently organized in New York and comprises the largest cooperative benevolent organization ever attempted in the United States. Herbert Hoover is chairman and Franklin K. Lane is treasurer of the council.

One American dollar will keep life in one of the starving children for a period of 30 days for the entire dollar is spent in the purchase of food, as the European countries receiving the benefits of this relief furnish free labor, free transportation, and all the other things that usually cost money.

In the feeding of these children there is no waste and no food falls into hands from which it was not intended as no food can be carried away. Each hungry child is furnished with a tin cup and a spoon and once a day they come to the feeding station, receive their food, eat it on the premises and then go away with a half filled stomach and wait for the next day. Only the most needy cases receive help for after a child has been fed for a short time and gains sufficient strength to enable it to live a little longer its place must be taken by another child whose necessities are even greater.

If these children were to suddenly appear on our own streets and country roads, bare-footed, bare-headed, skin blue with cold showing everywhere through scanty rags, eyes big with famine, cheeks sunken, hands and arms but skin and bone, we would run to pick them up and clothe and feed and comfort them.

Well, they are not on our streets, not in our own country and we cannot personally minister to them, but the European Relief Council, directed by Mr. Hoover, can minister to them if we but furnish the means, and so the eight great benevolent organizations have united in an appeal to America for funds to save nothing less than a whole generation of children, who, unless we come to their rescue must inevitably perish of cold and hunger.

Thirty three million dollars is the amount required. There will be no "drive" to raise that sum. It will just be a nation-wide collection. Every dollar contributed means the saving of one child's life for 30 days. Every $10 means the saving of one child's life through the winter and until the next European harvest.

Don't wait to be solicited, but send your contribution to Franklin K. Lane, Treasurer European Relief Council, 42 Broadway, New York City.

GHIRARDELLI'S

Ground Chocolate

On raw mornings

Somehow, Ghirardelli's never tastes so good, so warming, so comforting, as on raw mornings when you're up just a bit ahead of the sun, with lots of chores to be done. Then it is that you're doubly grateful for a strong cup of this delicious food-drink. It nourishes and sustains!

NEVADA HEREFORD RANCH

We always carry a large herd of high-class Herefords and at the present time we are offering:

A splendid lot of young cows with Harris Standard 2nd calves at foot, and many of them rebred.

A nice selection of young cows and heifers bred to our herd bulls.

A choice collection of open heifers.

A lot of good rugged range bulls. These are the real money making kind, and they are priced to make money for the buyers. We will sell them in car lots or in lots to suit buyers.

We also have some choice young bulls of herd-header caliber that we will sell well worth the money.

We invite your inspection.

John H. Cazier & Sons Co.

Otis Cordell, Herdsman **Wells, Nevada**

Our ranch is on the main line of both the S. P. and W. P. railroads and only a twenty minutes drive from Wells.

SIERRA VISTA HEREFORDS

One of the largest herds in the West. Built on a Repeater and Fairfax foundation. At present we have to offer 24 choice yearling bulls ready for service.

Sierra Vista Vineyard Co. Minturn — Madera County — Cal. On Highway 16 Miles South of Merced

walls would grow shallower and shallower as they approached the front of the house, until, in fact, they had no depth at all and merged with the three-foot-wide trench that they had first dug.

"Oh, I see!" said Steve, when Dick had outlined the plan. "On the two sides we shall see a wedge-shaped exposure of earth with the thick end of the wedge at the back, where we want the side walls to sink most, while the point of the wedge will be at the front, where we want the walls to sink the least. Am I right, Dick?"

"Entirely," said Dick.

By the following Saturday the boys were ready to turn in the water from the old canning house tank. Col. Smiley, who had been watching the preparations, seemed even more sanguine over the outcome than the boys were. Dick swung his plumb line over the cornice of the roof and attached it so that they could see on the ruler below how much the building was righting itself from day to day. Then they turned in the water.

On Monday they found that the earth had absorbed all the water in the trench. When the boys reached the old jail after school they found Col. Smiley already there; he looked disappointed. He had been watching the plumb bob all day Sunday and all of Monday, and it had not budged by the thickness of a hair. Steve was heartbroken.

"Say, Dick," he said as they turned in a fresh supply of water, "suppose the whole scheme comes to nothing?"

"Steve," replied Dick, "if that front wall was fifty years in going down, we can wait fifty days for the others to settle."

On Wednesday the wall was straighter by one-sixteenth of an inch. The next day the plumb bob showed them an eighth of an inch gain. Saturday night the boys found that the building was a quarter of an inch straighter.

"Dick, she's moving some," said the colonel as he met the boys on Monday evening on Main Street. At that moment a succession of unearthly shrieks came from the lane that led to the old jail.

"What in the world has broken loose?" cried the Colonel.

The screams grew louder, and added to them were the sounds of running feet. A moment later Col. Smiley and the two chums were surrounded by a dozen of the most abjectly frightened village boys they had ever seen.

"What's the matter?" demanded the Colonel. "Have you been seeing ghosts?"

"Yassir—yassir!" cried five or six at once. "We've been down by the old jail. It's ha'nted. We heard the awfulest groanin' and hollerin' in there. They was men's voices a-groanin' and women's voices a-screamin' and—"

"Hooray!" shouted Dick. "The old jail is on her feet. I was sure she'd come round. The sounds were the noises of the joists and other timbers settling themselves into their old places. Come on, let's get lanterns and find what the plumb bob has to say."

It was an anxious trio that ten minutes later bent over the rule and plumb. They found that the building had so far righted itself that it was only half an inch out of the perpendicular.

"If the house hasn't cracked," cried Dick, "it will go the rest of the way in no time! Now we must get the water out and fill the trench in order to take up the extra moisture. The job is done."

The next day showed no flaw in any wall.

One week later workmen were transforming the old jail into a modern factory. On that day Dick and Steve called at Col. Smiley's office.

"It was a fine job, boys," he said. "Mr. Chief Engineer, here are $500 for you in money and 25 shares of factory stock."

"Here's a hundred dollar bill for you, Mr. Assistant," said Dick to Steve. "And, Col. Smiley, I'd be obliged if you'd take this $50 and make out a stock certificate for five more shares in the name of Stephen Harris."

"Ha! Going to give Steve five shares, are you? Well, I'll make out the certificate for ten shares. I want to give Steve five on my own account. Say, boys, what do you say about your growing up with this good old town? We need you right here."

TIME TO REPLENISH THE LINEN CLOSET

The long talked of reduction in the price of living has actually appeared in one spot, at least. Sheets and pillow cases and towels and domestics generally are cheaper.

The housewife who has been cherishing her threadbare household linen through the days of sky high prices and watching store windows and advertisements for some hopeful signs, heaves a sigh of relief and replenishes her supply—likewise her self respect. For the housewife may wear shabby coats and hats and shoes with the uplifted spirit of a martyr for high principle, but when her sheets get down to "a threadbare three" she feels downright shiftless "poor trash"—she can't help it. And happily, domestics now seem to be lower than other textiles in comparison, though all are hopefully coming into reach.

Table linens and blankets are also showing the same tendency, as well as linoleums and other household supplies. It will pay to keep watch of announcements of retailers and furbish up the house.

AVOCADO RECIPES

Secretary McNally of the California Avocado Association announces that the association has issued an attractive little booklet, giving a number of recipes for serving avocados in various ways, with a preface explaining when an avocado is in proper condition for use. The booklet is cut in the shape of an avocado. Copies will be distributed free to members and sold to others at ten cents to cover cost.

HINTS FROM HOUSEKEEPERS

Cheese Custard Pie

Here is a cheese custard pie recipe which some of the housewives may like to read:

One small onion cut fine, 1 cup grated California cheese, 2 eggs beaten, pinch salt, ¼ cup sugar, 1 teaspoon corn starch, 2 cups cream and milk mixed, nutmeg flavor. Mix well. Bake in bottom crust.—Mrs. Joe Scheiber, Lincoln.

NECESSARY

Don't get the notion in your head
That you can be a shirk.
The world won't give you meat and bread
Unless you give it work.

"The Home of Fine Linens"

For forty-two years Coulter's has been known as the Home of Fine Linens.

We sell only brands we can recommend for high quality and durability; yet we price them so fairly that they cost little, if any, more than inferior sorts.

January Sales of Fine Linens

are now in progress; reductions of twenty-five per cent. are not uncommon.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

February 3, James J. Jeffries, Burbank.
February 5, W. A. Thompson, Hynes.

Shorthorns

February 22, California Shorthorn Breeders Association, University Farm, Davis.

Hampshires

February 8, Ortega-Underhill Ranch, Santa Barbara.

Poland Chinas

February 15, Bassett, Ross & Crawshaw, Hanford.

February 26, Kings County Poland China Breeders Association, Hanford.

Berkshires

February 1, Italian Vineyard Company, Guasti.

Durocs

February 16, Diamond Bar Ranch, Spadra.
February 17, Falfadale Farm, Perris.
January 24, Glenn County Duroc-Jersey Swine Breeders Association, Glenn.

Percheron Horses

February 17, M. Bassett, Hanford.

Hollow Hill Farm has sold a grade Guernsey heifer, sired by King of Hollow Hill, to B. F. Bowen of Riverside for $500. This is a record price for grade Guernseys. The same man also bought three other grade females and a pure bred bull. B. H. Fish of Santa Barbara bought four females and a pure bred bull. B. M. Lederer of Chino took six females and a bull and Walter Young of Artesia bought six yearling heifers and a bull. The demand for Guernseys is very brisk and Hollow Hill expects to close deals for a number of the top pure breds in a few days.

Laurel Prince V, a Berkshire boar raised and developed by the Italian Vineyard and sold to the Ashlane Farms at Pleasant Grove, Utah, certainly burned up the Northwest show circuit last fall, being grand champion at Lewiston, Idaho, Spokane and at the International in Portland. The Northwest states are particularly strong in Berkshires and it speaks very well for a California product to make such a showing there.

The Eagle Ranch at Atascadero, which is owned by F. F. Peabody of Arrow Collar fame, has just received a three year old Angus bull, Proud Eric of Aberlour, who has been a blue ribbon winner in the Highland and Aberdeen agricultural shows in Scotland. Mr. Peabody, who has a small herd of Angus which he purchased from the Brook Hollow Farm at Hollister, bought the young bull while on a trip to Scotland last summer.

J. Courtland Scott of Scottwood Farm has sold to Belle F. Miller of La Crescenta his well known pure bred Nubian buck, Scottwood Redcliff, whose sire is Holly Lodge Shingle, one of the imported Nubian bucks in the country. Redcliff's dam is Wigmore Pansy, one of the does imported at the same time. She is still at Scottwood Farm.

Chas. Anderson of Burbank, whose sale of Holsteins last spring was a record breaker, has decided to renew his Holstein affiliation. He has purchased 67 females from 29 federal accredited herds in the Middle West and will soon be milking cows galore as all are either dry cows or springing youngsters.

T. H. Brice, manager of the California Milk Producers Association, has started a pure bred Holstein farm in conjunction with Mr. McGee of Whittier. They have purchased ten fine pure bred cows, including Maybelle Pontiac 2nd, a 640 pound three year old, and Belpil, a 23 pound cow, from Burr Farm.

Mollie Creamelle, a Burr Farm Holstein, has just finished a 23 month record of 33,107.2 pounds of milk and 1,397.6 pounds butter. She dropped twins to start with, at the end of the first year dropped another calf and at the end of the 23 months dropped twins again, making five calves in all. The calves are all sired by Sir Veeman Korndyke Pontiac, the senior herd sire of the Burr Farm. One of the bull calves is in service in the herd of J. M. Mayo at Compton.

J. I. Cazier of the Nevada Hereford Ranch, Wells, Nevada, reports the sale of the ten months old bull, Bright Anxiety, to E. A. Noyes and Sons, Sutter. This youngster was bred by Mousel Brothers of Nebraska. He was sired by a son of Bright Stanway and is out of a granddaughter of Beau Brummel. His dam, Bright Duchess 48th, now owned by Messrs. Cazier, is the dam of the $8,000 cow, Bright Duchess 77th. The price has not been made public but it is understood to be in the four figure division. The Caziers had a show herd at the Ogden Livestock Show the first week in January.

Russell Richardson, secretary of the Finnell Stock Farms Company, Galt, announces that his firm has received the Hereford bull, Cardinal, recently purchased from a Kansas breeder. This bull, now ten years old, is a son of Domino.

Plans for the annual spring sale of Hereford cattle will be perfected at a meeting of the Pacific Coast Hereford Breeders Association this week. The sale will be held at the university farm, Davis, February 23. It is expected that a special effort will be made to assemble an offering that will appeal strongly to range operators.

C. L. Hughes, manager of the California Breeders Sales and Pedigree Company, Sacramento, is now in the Northwest for the purpose of selecting entries for the annual Guaranty Sale to be held at Sacramento in March. Hughes states that the committee in charge of the arrangements has proceeded far enough in its work to assure that the 1921 offering will be up to the high standard of former sales and that some very high production will be represented.

One of the most remarkable Holstein records ever made in this state was recently established when Josh L. Wilson, a 15 year old boy of Lomand Park, succeeded in giving the 16 year old cow, Candida of Sleepy Hollow, a seven day record of 23.30 pounds of butter from 604.3 pounds of milk. This young breeder succeeded in getting his charge up to 91 pounds of milk on her best day. Of even greater interest is the fact that this record is a world's record for a cow of that age.

The Berkshire sales to be held the first week in February, Italian Vineyard Company, Guasti, February 1, and A. B. Humphrey, Escalon, February 3, are attracting wide attention, and a number of Eastern breeders have signified their intention of attending both events. L. E. Frost, publisher of the Berkshire World; E. J. Barker, director of the American Berkshire Association, and Chas. M. Talmadge of Salem, Oregon, are among those expected.

Mrs. Ruth Hardy, manager of the Anchorage herd of Berkshires, Orland, has sold five gilts to a pig club at Overton, Nevada. Mrs. Hardy states that Nevada ranchers are manifesting considerable interest in Berkshires and that Anchorage Farm has shipped 19 pigs to that state during the past two weeks.

The American Hereford Journal reports that during the year just closed a total of 15,432 Herefords were sold at public auction for $6,425,855, an average price per head of $416; 2,989 bulls averaged $474 and 12,443 females averaged $403. In 1919 19,095 Herefords averaged $491.

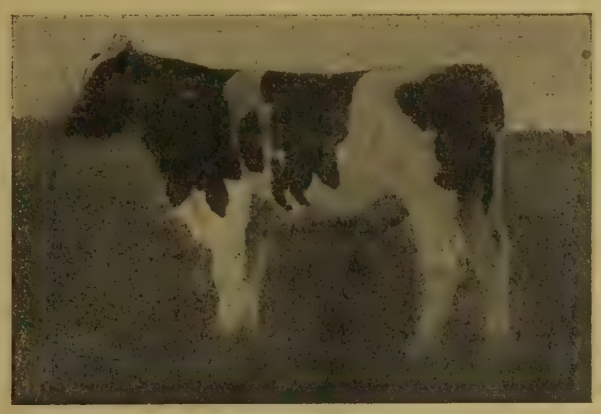
The top price paid on the Chicago market during 1920 for steers was $18.50, that top being recorded for 46 yearling range bred Herefords.

In 1920, 121 auction sales of Jersey cattle were held in which 5,533 animals were sold for $1,958,428, an average of $353.95.

The Chamber of Commerce of Kansas City, Missouri, has offered prizes aggregating $2,000 in the "Missouri Better Bull Campaign" under control and supervision of the agricultural extension service of the Missouri college of agriculture. The first prize is $1,000, the second $500, the third $300 and the fourth $200. Awards will be made on the basis of scrub bulls replaced by registered bulls. A scrub bull is replaced when the scrub is castrated or sold out of the county and a registered bull purchased. A scrub bull is defined as one not registered or eligible to registry. Any county which, at any time during the year, completed its work with 100 per cent pure bred bulls will be entitled to the first prize. If more than one county shows 100 per cent registered bulls they will be entitled to first, second, third and fourth prizes respectively, in the order in which the work was completed. Not less than 20 counties must compete before prize money is available and all entries must be made by January 31, 1921.

Consider the Future

The man who starts now to achieve success needs to consider more carefully than ever the foundation and methods of his venture, and nowhere does this apply more forcibly than in the breeding of registered Holsteins.



PRINCE AAGGIE MEAD

We regard this as one of the outstanding bulls that we have yet been able to breed, combining as he does extraordinary type with breeding in which we have the utmost confidence.

His sire, KING AAGGIE MEAD, is a full brother to Aaggie Acme of Riverside 2nd, whose record of 1,331.78 lbs. butter in one year is the world's strictly official record. She is also the dam of Miss Aaggie Acme Burke, whose record of 24,338.8 lbs. milk in one year as a first calf junior 2 year old is a world's record in class, and her record of 1,034.44 lbs. butter in the same lactation period is third highest in class. She is now again on test and in her first 7 days has over 31 lbs. butter to her credit. This heifer in turn is the dam of the $41,000.00 bull King Korndyke Pontiac Acme.

His dam, MISS VALLEY MEAD DE KOL WALKER, with three world's records to her credit as a heifer, and with 1,113.57 lbs. butter in 342 days as a junior 3 year old, is one of the great females it has been our good fortune to breed and develop. Her dam, De Kol of Valley Mead 2nd, with 906 lbs. butter in one year as a 3 year old, and 1,011.71 lbs. in one year as a 4 year old, world's record for two years production at age when made, is a daughter of the great foundation cow, De Kol of Valley Mead. Miss Valley Mead De Kol Walker is also the dam of Sir Aaggie De Kol Mead, now in active service in our herd, and of King Korndyke Pontiac 20th, the $12,000.00 bull that sired the $41,000.00 bull King Korndyke Pontiac Acme.

We declined to sell PRINCE AAGGIE MEAD outright, as we wish to give him a great deal of service in our own herd, but we have sold a half interest in him to a breeder who has assembled one of the highest class herds of females in California.

FRED HARTSOOK

LANKERSHIM CAL.

A hit-or-miss selection of foundation breeding Holsteins has foredoomed many a breeder to failure right at the beginning, in spite of diligent effort to develop and breed from such a foundation afterward.

Few men have the time or means to poineer unknown families in breeding Holsteins, and such a course is admittedly poor business when the opportunity is afforded to secure animals from families of known production and worth.

We have developed a number of families within our herd whose production is proved, and whose ability to transmit production is also proved. With these families the stage of pioneering is long past, and their present offering can with reasonable certainty be depended upon to carry on the tremendous production records already established.

From these proven families we are able to offer a choice selection of bulls, from high class sires to head registered herds, to first class bulls to head grade dairy herds.

Our prices have always been considered most reasonable for the quality of bulls offered, and we invite you to put your herd bull question up to us. We may have just the bull you need to head your herd.

A. W. Morris & Sons Corporation

Woodland, California

54 REGISTERED GUERNSEYS 54

Absolute Dispersal **At Public Auction**

Revada Ranch, Yountville, Cal.
Thursday, January 20, 1921

Imported Cows!
Bred and Open Heifers!
Bulls of Service Age!

HEIFERS comprise a large percentage of the offering, ranging from bred heifers down to calves, mostly out of imported dams, and by such bulls as Itchen Daisy May King of Langwater, Imp. Ricardo of Edgemoor, Auricle's Cherub of Edgemoor, and other sires of rich breeding.

COWS of splendid breeding, most of them imported, and including daughters of such sires as Governor of the Chene, Raymond of the Preel XIII, Robert's Secret, and others of corresponding merit.

BULLS in wide selection and considerable numbers (affording an opportunity unparalleled in California to secure bulls of this breed at your own price at public auction. Dairymen and breeders alike will find individuals to interest them in this offering.

Every animal positively guaranteed to be a breeder every animal tuberculin tested and sold subject to retest by the buyer, except as announced in sale ring.

REVADA RANCH is nine mies north of Napa, Calif. Headquarters of sale will be Palace Hotel, Napa, from which point arrangements for transportation will be made morning of sale for buyers coming in by train. SALE STARTS PROMPTLY AT 10:00 A. M.

When Writing Advertisers Mention California Cultivator

They Die Hard

By A. L. Spellmeyer

CATS have nine lives. I have known of a grizzly bear taking 11 well placed 30-30's around the heart and going 12 miles. Old Peg-leg, whose career was terminated by Officer Johnson at the Wild Bill place in northern Arizona, lived two hours with a bullet placed directly between the eyes. We are told that in the ages past many of the great beasts and great lizards held on to life in muscular offensive long after their vital organs had been destroyed or paralyzed.

Menaced by instability which has made farming and livestock growing the sport of gamblers, due to uncertain markets for products, those who have bled white essential production, injured the value of the bulk of land of this country, and forced great loss upon the nation, die hard. They are not agreeing to better conditions without a struggle.

We note the propaganda to show that any protection of the farmer is "class legislation." Many claim they don't like the tariff proposed recently to help the lemon men, farmers and cattle raisers. They are for tariff, but not the kind that helps the backbone of the country.

We are catching the brunt of the last struggle against the certainty of shortage. It won't last much longer, but it shows power.

The cattlemen of California formed an active medium to ship surplus cattle out of the state. Within a few weeks they are receiving cattle from outside of the state for local killing. Is this a threat or is it due to the fact that the market is supposedly better here than in Kansas City, that Kansas and Texas cattle should come here, with the known shortage of supply and numbers on feed in the Middle West?

Beef, carcass beef, is being marketed by the refrigerator cars through the adjacent districts of near by states at prices to equal six cents live beef. While steers are bringing ten to 11 in California, delivered packers, the cheap carcass meat is being sold in Arizona and elsewhere at an equivalent price dressed after paying the freights. We presume refrigerator cars must pay freight. It makes those fellows sit up who are feeding beef or raising feeders to ship to Los Angeles, on the ten to eleven cent market, to find that an Eastern packer can buy meat in Kansas City, kill it and pay the freight and sell it less dressed than Western packers pay live weight, or about the same.

Is it a market development, or is it a hammer to force prices down, to force more loss upon cattle raisers? What can be the sense of depressing livestock further unless there is the intention to actively own the cattle and ranges as well as the marketing facilities?

In December when it looked as if the war corporation measure and the tariff measure would pass in a rush by a great majority, I wrote that it looked as if insiders did not think it would pass. Opposition has developed. Relief needed at once for farmers and livestock growing is delayed. The market is the best indication of what will be done, as the producers seem but pawns in a game thoroughly controlled by those overlords of marketing and finance. Great is their power. The eagle soars to heights, but the eagle returns to earth. The higher the place the greater the fall. It may be safe to do anything else but it is not safe to keep on injuring the source of food production. A growing proportion of the people and of the politicians are commencing to understand what blows at farming and livestock mean in the end at all business. Now the cry is that a temporary tariff will mean reprisal by other nations who will consider such tariff an embargo. Is this nation so weak that it can loan its billions and be afraid of what some other country thinks when it merely regulates its internal affairs to protect vital production? That refrain sounds a lot like the tune we heard when Mexico killed our citizens and just before we humbled the German eagle. They tell us the war corporation measure will merely benefit the harvester trust and the steel folks, etc., and not the farmers. It must depend upon the way it's worked. If the intention is to benefit farmers, and our employed servants do their duty, the farmers will get the money; if our servants in public office misappropriate and disregard the object of the loaned money, the farmers won't get it.

It is the same old policy of dividing up opposition. Get those fighting split up and they are easy to beat.

Another class that is slow to see what is coming and accept the inevitable is the retailer of food, principally the butcher. Forty-five cent steak and 60 cent T-bones are still sold in the markets. Although carcass meat is being sold at 12 to 20 cents, the retailer hangs on to the high price with tenacity. The old cow steak is sold at the same price that would be profiteering profit for the finest steer beef. These retailers must be primordial in their greed, as they certainly die hard in accepting a pre-war adjustment which has long ago forced the source producing the supply of food they handle far below cost of its production.

They all tell us that the Los Angeles cattle market is at present the highest market in this United States, with its seven to eight cent cows and its ten to 11 cent steers. We know that the men selling these animals are losing money at the price. Many a fed cow sold in Los Angeles will not bring the producer of that cow $20 when he pays his fattening bills. Now the federal trade commission investigation shows that a cow costs over $75 to produce.

The Los Angeles market has not dropped to the depths of other markets because our packer loan folks haven't got to a great control of finance, with many loan sources, but do a fairly competitive business in these parts. Then the crux and secret of it all is that independents are killing the bulk of the Los Angeles meat supply. The line packers have been losing proportion of kill for a year or two here. One independent here kills more than the largest line man. It is said he prefers a half carcass daily customer to a 20 carcass customer. It takes 40 times the effort of competitors to cut his volume that 20 carcasses.

The outlook for grass is good in California. Except in the southern end of the state there has been ample rain and fine weather. In the southern end there has been fine weather but more rain is needed. The northern end should have some April beef and much May beef.

Men who contract any beef to killers at less than ten cents are foolish. Don't let the threat of these incoming shipments from Kansas and Texas and this cheap carcass beef discourage. It can't last. All these plays were formerly deep mystery. The practices proven by investigation and now of common knowledge to most people as to domination and control of livestock, finance, marketing and price were thought a few years ago too unworthy and criminal for any decent men to be guilty of.

Now these people manipulating meat and food finance and marketing are up against just what an individual would be in fighting a federal lawsuit earnestly conducted. They are bound to lose, as millions of producers and tens of millions of informed men and a hundred million consumers realize the menace to the country when its farmers cannot secure a living profit. Our grain is unsold, our markets clogged with meat, and the world across the water starving—help implored for millions of dying children and we have no money as we cannot sell our food.

Surely we could supply the food from our surplus to these starving peoples and take some security therefor. They would live and we would have prices on a living basis. In the face of all this apparent beef surplus right now we are menaced by certain cattle shortage in national supply. We are only clogging our markets with our principal, our breeding stock,

which must produce our future supply. Our cattle business in this nation and much of our farming business is virtually in a receivership. It could not pay up today on values as they are, and with its expense it has no hope of profit unless conditions change. And while this all is going on the world is starving and every paper we take up shows appeals for money from foreign sources for aid to save human life. Every paper shows advertised l nds of other nations, bearing high interest rates.

Our banks and great houses of finance take these bonds and sell them at handsome profits but will not take our products and supply the starving countries that we are told need so much help.

There isn't any farmer or livestock man around who would refuse to take part cash and part interest bearing bonds of good character for his products on a fair price basis.

California has the best cattle market so far and whatever the cause of it, we can be thankful for that much. California also has green grass, rain and a fine season apparently ahead at a time when other parts of this country are just getting into winter and just commencing to have their snow and blizzards and cold weather which will tie them up.

When the inventory is taken after the liquidation and chaos of the last year in cattle we are going to realize what a great loss we have suffered in our breeding stock, and we are going to wake up. When we find that less barley and less grain is being planted and less farming done we will wake up. Because we have a surplus on hand now it won't continue unless we keep on producing, and the tendency is to cut that.

Dairy Farm Crops

By Ernest Braunton

THE "First Annual Dairy Course" under the auspices of the agricultural extension service of the University of California, the California Dairy Council and the dairy department of the Los Angeles County farm bureau held a three day meet at Downey and Van Nuys, January 3-6. At the latter place Prof. B. A. Madson of the agronomy division of the state university was introduced by Assistant Farm Adviser G. E. Gordon to a small but interested audience and spoke substantially as follows on the subject "Dairy Farm Crops":

"All agriculture is based on crops, and their amount and character are dependent upon fertility of the soil being maintained, rotation being the key to success. It is not possible to constantly maintain a single crop upon the same acreage for years except through excessive cost of fertilization, and even then the maximum will not be attained. Too little attention has been paid to systematic rotation so that a definite program for all crops, soils and conditions has not yet been determined in any state or country. In some parts irrigation is necessary to reasonably successful rotation. Throughout California the principal dairy farm crop is alfalfa and it is of greatest value for it fits into any system of rotation, in fact is generally the basic crop of such operations, so we will consider it in detail.

Alfalfa Culture

"It is a well known fact that in California alfalfa starts to decline in from four to seven years and rotation alone brings maximum results. In some other states, where winters are very cold, good crops are maintained without change for 15 years. Freezing of the soils tends to keep them open. With us they become compacted because of mild winters, and the plants do not become totally dormant. Weeds also gain ascendency during winter, for many of them make their best growth during the period when alfalfa is nearly at a standstill. They dry out the soil and crowd out the weaker alfalfa plants.

"One of the prime causes of failure or partial success lies in lack of preparation of the soil. A good mellow seed bed should be prepared and leveling and checking done so that water may be easily and uniformly applied. The best time to work the land, especially if it be of heavy texture, is late summer or early autumn. The soil is then lightest in weight and will not pack or puddle, an important consideration, for if packed it will be several years before this fault is overcome. Light soils may of course be worked at any time. In actual practice seed may be sown at any time except during hottest weather, but spring is generally best. It is then that crops start best and weeds may first be started and destroyed so that this menace is controlled or removed. Fall seeding requires more water, both for soil preparation and to start germination. Because of lack of uniform moisture more seed is also needed. For spring seeding 18 or 20 pounds per acre is sown, while for fall seeding 25 to 30 pounds should be used. Fall seeding also brings winter weeds for competition. The advantage of fall seeding, especially where winters are warm, is that an early start is made, for if top growth is slow, root growth is good and when favorable weather comes the growth is rapid.

Inoculation

"All legumes make best growth when inoculated. If soil is ideal, with plenty of organic matter present, bacterial action is not so essential for alfalfa but the crop is pulling on the soil for nitrogen when it should be getting it from the air. There are many cases of spontaneous inoculation but it is uncertain and therefore one should inoculate. The old method of removing soil and scattering it over the field is too expensive and too cumbersome. The best method is to take two or three pailfuls of soil from a well inoculated field, put it in a barrel of water, scatter this over the seed and sow as soon as convenient. Where soil is difficult to obtain the commercial cultures sold by dealers are best and are always good if fresh. The advantages are that you know what you are getting and the cultures are pure, without contents you do not want.

"In rotating crops your catch crops or all except alfalfa will be annuals. A seven year scheme is best, leaving alfalfa undisturbed for five years and other forage, hay or silage crops for the two other years. Thus, if we had a 70 acre ranch we would plow under ten acres of alfalfa each year and also sow ten acres to alfalfa, so we would at all times have 50 acres of producing alfalfa. Every fall, when alfalfa is turned under, replant at once for a winter crop. Barley is good and will ripen in early spring. Some sow barley or oats mixed with vetch and if put in early it will be good hay in May and will yield three or four tons an acre, or it may be used as silage for summer feeding.

Beets, Corn and Sorghum

"Others plant root crops such as stock beets or mangels in October or November; they mature in early spring and make good feed for summer. But root crops are costly at all stages, though they grow well in winter, producing heavily—25 to 40 tons an acre. One grower at Downey claims a crop of 60 tons, an unusual return. Harvest early for summer forage crop—in May. Irrigate and cultivate shallow. Indian corn is as good as anything for a summer crop. But if water is scarce and the section hot and dry, sorghums are better. But plant them early for they should be mature, the seed ripe before harvesting or they make poor silage. Some use Sudan grass, but unlike the sorghums this crop should be cut early—before heading out. Sudan is also a good summer pasture for it yields enormously of a light feed. On a two acre trial plat we turned in 30 sheep when grass was a foot high, yet we had to cut it for hay in two weeks. (The Fontana Land Company found that large numbers of young pigs feeding on it did not remove the necessity of regular cuttings for hay. E. B.) The sheep were then put back and fed upon it throughout the summer. There is no danger from prussic acid content except grass is frozen or of very stunted growth. There is no danger in Sudan if growing well. One may even grow kale or a catch crop. Alfalfa makes the finest pasture of all but pasturing is poor practice and maximum results cannot be obtained; therefore cut for hay."

IMPOSSIBLE

"From now on," sternly said Squire Ramsbottom, the well known jurist of Petunia, "I am going to conduct the business of this office strictly according to law and common sense."

"But looky here, Squire," returned Constable Sam T. Slackputter, "you can't run it in two different ways at once. You've either got to conduct it according to law or to common sense, one or t'other, but not both. It can't be did."—Kansas City Star.

A Better Way of Milking

LONG ago the De Laval Company realized there is no more reason for hand milking than for harvesting a grain crop by hand. But designing a milker was not simply a problem in mechanics. A successful mechanical milker must work in harmony with the delicate organism of a living cow.

After many years of thorough research and test, and after four years of commercial use, the De Laval Milker has proved itself to be a better way of milking.

Now the many De Laval users are practically unanimous in their agreement that it not only saves time and eliminates drudgery, but actually increases the flow of milk.

The De Laval will make your dairy business more profitable and pleasant. Write for full information.

DE LAVAL DAIRY SUPPLY COMPANY

HOW TO RAISE A CALF

By E. L. Koethen

A young calf is a good deal like a human baby; it must have clean food and of the right consistency, that is, it must have a balanced ration.

If the owner can afford to allow the calf to suck its mother, it will need no special care as to feeding, the only requirement being to see that tne mother is milked clean twice a day. But this is not usually the case. The milk is too valuable to allow the calf to get it all. In this case, it is best to take the calf away immediately after it is born. We allow it to suck once or twice, but the night after it is born the calf is spirited away in the dark and the cow does not notice its absence if it is carefully done, and though she may bawl some about it, she soon forgets, perhaps thinks it was only a bright dream about that calf. If there is plenty of skimmilk this is best. Be sure to see that it is clean and sweet. Scours can be produced very quickly by carelessness in this regard. In order to replace the cream that has been removed it is good practice to add a handful of good clean dried blood to each feeding. Strange as it may seem, we know of no better way to raise a calf, and never have any trouble with scours or other troubles. We have raised many calves in this way and with invariable success.

If the skimmilk is not available, other feeds must be resorted to, such as calf meals advertised by manufacturers, or it is feasible to make a meal mush for calf feed of your own mixing. The last calf we raised was raised on feed made from corn meal boiled in water and some skimmilk added, and a little blood. The calf did not get real fat on it, but is now a fine, vigorous heifer and has never had a setback.

As said at the start, cleanliness is the first requisite, and next, a balanced ration. A young calf will want some water to drink, especially if fed on mixed feeds. She will soon begin to eat hay and can be weaned in about two or three months.

JERSEY CLUB TO OFFER PRIZES FOR CALVES

Mario Fortini, owner of the Tintagel herd of prize winning Jerseys, was elected president of the Orland Jersey Cattle Club at the annual meeting of the organization last Tuesday afternoon in the Water Users' Hall. The cattle club, which has proven one of the strongest organizations in the project, enters the new season with every prospect of a successful year and a full program is being mapped out for the coming 12 months. The other officers elected were: Chas. A. Whitsett, vice president; Kirby Clark, secretary, and W. G. Gurnett, treasurer.

Kirby Clark and W. G. Gurnett were named a committee of two to consult and cooperate with Connty Club Leader Frasher in the formation of a calf club during the spring. The work of this club, which will be along the same lines as the pig clubs, will start the first of March. As an inducement to the members of the new organization, the Jersey Cattle Club has offered prizes asounting to $30 for the prize winners, the calves to be exhibited at the Glenn County fair next fall.

The resolution urging the renewal of the plan of loaning money on good cows by the bank was adopted. The next meeting of the club will be held at the H. W. Howard Ranch.

THE R. J. YATES POLAND CHINA SALE

The Poland China sale held by R. J. Yates, Orland, was held under very discouraging circumstances. Shortage of feed, credit and backing from the local banks all had a tendency to depress values. However, a few who either had feed or faith in the future were very good bidders and the total results were beter than many expected. The sows and gilts of breeding age sold at from $50 to $125 each, five head bringing $100 or better. Jack Cook, Fred Clark, W. E. Johnson, Kirby Clark and The Diamond Ranch Company, all of Orland, and Frank Harriger, Gridley, were the heaviest buyers. An average of nearly $60 per head was realized on the 37 head sold.

ORTEGA UNDERHILL SALE

The Ortega Underhill Ranch at Santa Barbara has chosen a fine lot of Hampshire sows and gilts for sale at the ranch on February 8. When Mr. Underhill embarked in the Hampshire business he acquired a foundation herd of 250 sows. These have been culled and culled until only 30 are left. These sows have produced the type of Hampshires Mr. Underhill believes to be right. He is retaining their pigs and offering the sows bred again to the great boars Exalted Ruler, Masterpiece and Chief Lookout. The litters they are carrying should be equally as good as the fine pigs they have dropped before this. There will also be a number of fine gilts bred along the lines Mr. Underhill has chosen as the ideal.

MILKING

There are at least four considerations to be observed in milking. They are cleanliness, thoroughness, gentleness, regularity.

As to cleanliness. This is a first requisite in order to produce sanitary milk. It is the practice of some dairymen to wash the cows with a hose and dry off with a rag just before milking. To us this seems harsh during cold weather. We prefer to use extreme care in keeping the stable clean so that the cows can not lie down in the dirt. Curry them before milking and wipe the udder and flanks with a damp rag so as to remove all loose dust and foreign material. The hands should not be wet while milking. It is the practice of some to wet the hands with milk and allow it to run down even into the milk pail. The hands should be dry. A narrow mouthed milking pail is best. Some dairymen make a practice of discarding the first two strokes from each teat in order to avoid any germs that may have accumulated at the orifice of the teat, also cover the mouth of the pail in order to prevent dust and other foreign matter from getting into the milk. Cheesecloth is used for this purpose.

The milking should be thorough, that is, no milk should be left in the teats. If this is not observed it will slowly dry the cow up. Some cows have a habit of withholding the milk so that it is necessary to have patience in order to get the last drop. It is said to be best to milk the teats empty at one stretch instead of switching off from one to another during milking.

Gentleness is always necessary in handling the cow for milk production. She should never be scolded loudly, never punched or beaten. If it becomes necessary to reprove her, do it by a slap with the palm of the hand. She knows the distinction between a slap and a caress. It is possible to be too strenuous in pinching or bruising the udder while milking. This has been known to produce serious disturbances. Be gentle in all possible ways with a milk cow.

The time of milking is of importance. The cow is a beast of habit and expects her feed and her milking regularly. The latter is of great importance. She likes feed out of the regular hours and in fact does well if she is fed small quantities whenever the feeder comes around, but the milking should be done at regular hours. Some cows carry so much milk that it is necessary to milk them three times a day, but it should be done regularly. Most cows do well with two milkings a day, and it is best to have these at equal intervals, rather than to milk at seven in the morning and five in the evening. It will be seen that this leaves an interval of ten hours in the day time and 14 hours at night, or a difference of four hours between the intervals. In the winter there is a great inducement to allow this irregularity, and where the cows are not fresh it may be permissable and the time lengthened as the day lengthens, but with a cow that is giving a large amount of milk it is hurtful.

WHO WILL OWN HIM?

King Segis Pontiac Jannek

KING SEGIS PONTIAC JANNEK will have a new owner on February 3, and he has every qualification to earn a fortune for the breeder or group of breeders fortunate enough to secure him.
His first daughters to freshen indicate that he is transmitting in a marked degree the production he inherits through his sire, whose dam was the first 37 lb. cow and the first to make over 1,200 lbs. butter in one year, and through his dam, one of the highest record daughters of Korndyke Queen De Kol's Prince.

As a sire of outstanding individuals he occupies a leading place among the present day sires of the breed, and he is only six years old. At the 1920 Los Angeles Livestock Show, in one of the strongest Holstein shows yet seen in California, his get won as follows:

SECOND JUNIOR YEARLING BULL
FIRST 2 YEAR OLD HEIFER
FIRST JUNIOR YEARLING HEIFER
SECOND JUNIOR BULL CALF
THIRD SENIOR YEARLING HEIFER
SECOND AND FOURTH SENIOR HEIFER CALVES
FIRST AND FIFTH JUNIOR HEIFER CALVES

GRAND CHAMPION FEMALE
SENIOR CHAMPION FEMALE
RESERVE JUNIOR CHAMPION FEMALE
FIRST IN BREEDER'S YOUNG HERD
FIRST IN CALF HERD
FIRST IN GET OF SIRE
FIRST IN PRODUCE OF DAM

If you can't afford the investment that this bull is unquestionably worth, form a company among your neighbors or associates, for this is one of the rarest opportunities to buy a real proven sire.

He will be one of the features in the complete dispersal of the

Lorraine: A Plea for the Family Goat

By Jean A. Koethen

SHE was six weeks old when she came to us, a dainty, lively little doe kid, and in the lonely days that followed, when she lifted up her voice and cried for the mother and sister she had left, it was my pleasant daily task, when other duties permitted, to cuddle her on my lap and feed her tender bits of green as well as the regular ration of barley porridge and dry barley. In this way a bond was cemented which has never been broken. Lorraine is ready to butt any other member of the family on the slightest infringement of her rights or disregard for her dignity, but her head is rarely lowered at "mother."

We had heard a good deal from our neighbors of the cheapness and excellence of goat's milk, and when the opportunity came to purchase the daughter of a long distance milker for $15, it seemed our duty, in the interests of economy, to make the plunge and find out if all we heard were true. "We can't lose," I told paterfamilias, "for any sort of milk goat is worth $50." To which he replied, manlike, "You will do as you please, of course, but I won't milk her." I had never milked anything in my life, but I felt sure I could do what so many other women were doing, and we bought the kid.

The first few months, as it was summer and there was no green feed, we bought bran and rolled barley for her. I was never able to keep account of her feed because we fed her and the chickens out of the same bag. When the vacant lots adjoining us were green again she was staked out, and while she always had her bran and barley when she was brought in at night, she ate but little of it. Shortly before she kidded, at the age of 15 months, I began feeding her dried beet pulp, and that has been part of her ration ever since.

On the advice of neighbors whose experience I respected, I at first gave her a wet mash of bran, barley and beet pulp at milking time, but she never ate it as readily as she ate the same feed dry, and there was so much left over at every meal that I finally gave up the moist mash entirely. During the summer we bought alfalfa for her, and now that she is staked out all day she still has dry alfalfa and beet pulp in her shed, beside the basin of bran, barley and beet pulp at milking time. At first I bought salt cake for her, but she did not care for it, and it is some time since she has been salted.

She came in a four quart milker, to our great delight, and is still, in her seventh month, giving two quarts. Her kid we sold for $25, which nearly paid for Lorraine and her keep up to the time she kidded.

I have often been asked, "What do you do with so much milk?" That is easy. When Lorraine came in, Little Sister was just recovering from diphtheria, and could not drink too much good fresh milk. A month later Big Sister came home from the hospital, where she is in training, for a long rest, and she too developed an appetite for goat's milk. The day she went back to the hospital an invalid neighbor called up to ask if we had milk to spare, and she is still taking a pint a day at 15 cents, which pays for Lorraine's feed, while the family has three pints absolutely free of expense.

There should be no more rivalry between goat and cow than between flivver and Cadillac. The goat is the poor man's cow. She eats the grass on parkways and vacant lots, which would otherwise be wasted. She eats lettuce leaves, pea bods, cucumber peel, even banana skins, if she is trained to it. She is particularly fond of branches of trees and can be put to good use in clearing brush land. Oak is her favorite delicacy and rosebush clippings her delight. Of course she cannot be turned loose in the garden or orchard, for there would soon be no garden or orchard left. She is better off with the barest shelter from rain or sun—no expensive house, just a shed suits her. Lorraine lived with the chickens for a year on the most amicable terms,, and it was only for the sake of keeping the hens out of the goat's feed that the two were finally separated. Thousands of families which could not possibly keep a cow and which find it hard to afford cow's milk are finding that the same outlay, with a little trouble thrown in, will provide two or three quarts of goat's milk.

The estimates given of the cost of keeping a goat are not always accurate. I doubt if any milk goat can be fed for five cents a day, or even ten, but if it costs 20, the family is getting its milk at ten cents a quart or less, which is cheap enough these days.

The little family goat requires no more defense or apology than the little family hen. They are two of a kind, and they are here to stay. Goat's milk is not cow's milk. The cream does not rise readily, and the family that requires thick cream for its coffee will be disappointed unless it is able to keep the milk for forty-eight hours or longer. But in place of cream you get milk that is just as palatable after it has been skimmed as before. The cream stays in the milk instead of rising. Because the cream or butterfat is so slow in separating, the goat is no competitor of the cow as a butter producer, though a good many families do make butter from goat's milk.

If the milk is kept in a warm place it will usually sour in 48 hours, and if fresh milk is put in the bottle which has held sour milk it sours in 24 hours. Goat's milk cottage cheese is said to be a very delicious product, but we are so fond of the fresh milk and so glad to have a little sour milk occasionally for pancakes and gingerbread that ours has never reached the cottage cheese stage.

Lorraine's vocabulary is limited, but she speaks a language that cannot be misunderstood. When she is staked in sight of the house and is comfortably chewing her cud or browsing, she greets me whenever I appear with a low call, more like the whinny of a horse than the bleat of a goat. That means "Hello, mother!" When she lacks something necessary to her comfort, such as water, feed or shade, and when milking time approaches, her call is gentle no longer, but becomes a well defined bawl. Then there is another call, which I call her complaining call. A goat, you know, is a fussy creature, and mischievous as well. That old story we used to tell the children about the goat that complained to her master of the boy who tended her in order to get him into trouble is well founded. When Lorraine is not perfectly satisfied, though she may have everything she needs, she greets me with a call not so loud as her hungry bawl nor so gentle as her friendly greeting, a sort of complaining whine, which means, "Don't you see how miserable and unhappy I am with nobody to do anything for me?"

Spoiled? I am afraid she is, but the goat is used to being one of the family. She has been that for 5,000 years in the Orient, and the family that keeps a goat and does not make a pet of her is missing the best part of it all. With the exception of the dog, I know of no domestic animal so intelligent. She does not quite laugh, but she has an obvious sense of humor. When Lorraine was a little thing she used sometimes to break her rope. Then we never could catch her. Round and round the oak tree she would go and up and down the yard, as long as we chased her. When we sat down and waited for her she came up to be caught. And she does the same thing now on the rare occasions when she gets out without her chain. She will dance and prance and pretend to run away to tease us, but always after a few minutes play puts up her head for the collar.

Then no other animal can match her in cleanliness. Hay that has fallen on the ground is lost, as far as she is concerned. Moist mash that has once been placed before her must never appear again. She won't look at it. Feed the hens have got at is not for her. Everything must be perfectly clean and fresh. A cow will

American Jersey Cattle Club, 324-HW, 23 St. New York

lie down in the filthiest place in the yard. Not so a goat. Her body must be as clean as her feed. I cannot help thinking the extraordinary hardiness of the goat and the purity of her milk are due in no small part to her dainty habits, and because of these habits the care of her becomes a very simple matter. Many a woman on the farm or in the suburban home who would never think of undertaking the care of a cow, or even of chickens, finds the care of a goat a pleasure. To be sure, somebody in the family must be there to milk her morning and night, and she ought to be milked at about the same hours every day. Fresh water and feed should always be within reach, and her yard must be cleaned occasionally, depending on the size of the yard and the hours she spends in it. That is all there is to the care of a goat after she is raised. A kid requires more attention, but that is another story.

GERMANY'S OUTCRY AGAINST RESTITUTION

Recently in the German press there has appeared an outcry against the delivery by Germany of the number of milk cows demanded by the Versailles treaty. "In the name of humanity" Germany protests against a measure which binds her to deliver 810,000 milk cows to the Allies, because she states this will deprive the women and children of Germany of six million litres of milk per annum.

The German press forgets to say anything, however, about the cattle taken from the Allies, and it omits to say that the milk equivalent now being demanded from Germany by the Allies is the equivalent of the milk which for five long years was lost to the children of France and Belgium.

The Germans took from France alone 845,000 head of cattle, of which 517,000 were milk cows. By the terms of the treaty she was ordered to restore, within three months of the ratification, some 90,000 milk cows; she actually handed over only 65,560.

The French government presented to the reparation commission, in conformity with paragraph 11-A of Apendix IV of the treaty, a demand for 510,000 head, including 400,000 cows and heifers, a figure well below the number of beasts taken from France by Germany.

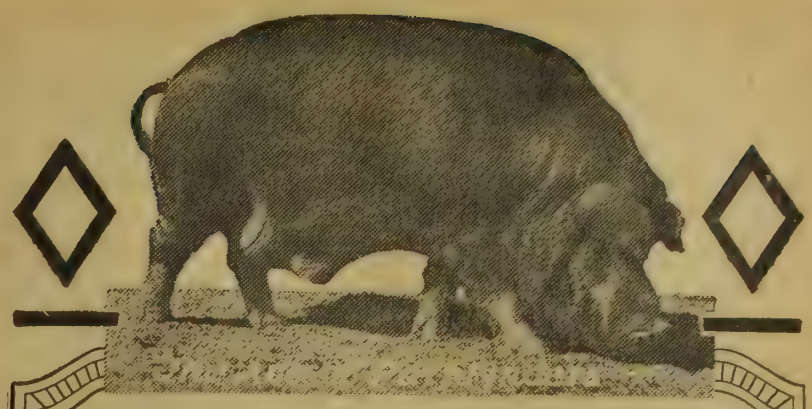
In all, the total of cattle claimed from Germany by the Allies, on the sole ground of restitution, is 890,000 head (including the 510,000 for France), and only a part of these are cows. Of this number, Germany still has to deliver 722,000 head. The question to be raised in the name of humanity is, therefore, "Is Germany going to retain these cattle or is she going to hand them over in place of those which she stole?"—From paper published by the Army of Occupation.

SHORTHORN SALE AT UNIVERSITY FARM

The cattleman looking for bulls will be able to supply his need at the fifth sale of Shorthorns to be held at the university farm, Davis, on Tuesday, February 22, 1921, during Stockmen's Week. So far over 50 bulls have been entered in that sale. Some heifers of outstanding quality, too, have been entered, and the embryo Shorthorn breeder will have an opportunity to secure a foundation for a herd. This sale is being held under the auspices of the California Shorthorn Breeders Association, which is an assurance of the quality of the animals entered. The usual guarantees as to breeding and freedom from disease will apply to all of the animals sold. Auctioneer Clyde Moore of Montana will conduct the sale. Mr. Moore has gained a splendid reputation for his work in the ring and it is his plan to remian in California.

HELPING PEOPLE OWN FARMS

Those interested in securing a greater number of small farm homes for California will find most valuable Circular 221 of the experiment station of California College of Agriculture, "How California is Helping People Own Farms and Rural Homes." It is by Dr. Elwood Mead and has illustrations and text mostly made possible by the state land settlements at Durham and Delhi.



ACE OF PATHFINDERS, head of the World's Grand Champion Duroc herd of 1919 and Grand Champion at Los Angeles, has sired more prize winners in 1920 than any boar on the Coast.

MAMMOTH SENSATION, JR., a giant Grand Champion boar that sires the extreme big type.

DIAMOND SENSATION, a typical son of the World's Grand Champion, Great Orion Sensation, and out of a Pathfinder dam.

Bred Sow Sale, Feb. 16

Thirty-five sows and gilts representing the best Duroc blood in America have been selected and are the best that Diamond Bar has to offer for sale.

We absolutely stand back of every sale. All sows and gilts are bred to these famous boars.

GEORGE W. BELL

A BUSINESS AUCTIONEER

When in need of high class auctioneering service I would be glad to have breeders and farmers correspond with me. I have had years of experience, know values and know pedigrees. I am selling for many of the leading breeders of California and am prepared to deliver the same results that have attracted this custom. Terms reasonable. Write, wire or phone.

GEO. W. BELL Tulare, California

SOIL TREATMENT AND FOOD SUPPLY

The future food supply of the United States in relation to population was the theme of the presidential address delivered before the American Society of Agronomy at Springfield, Massachusetts, October 18, by Dr. Frank S. Harris. He called attention to the well known fact that the increase in population tends to outrun food production, and discussed some of the measures available for increasing our food supply, namely: increase of our tillable area, through breaking up and bringing under cultivation all new and virgin lands; reclamation of arid lands by irrigation; reclamation of swamp lands, both fresh and salt water, by means of drainage; reclamation of alkali lands; increase of tillable area by bringing into tillage cutover lands and abandoned farm lands; increasing the acre production of crops on existing farm lands by means of better tillage, the better selection and adaptation of crops, and by better use of fertilizers, lime, and similar soil treatments.

Acre Yield Must Increase

There can be no question about the increase in demand for the products of the soil, and while the area of tillable land can be increased we must recognize the broad necessity of increasing production primarily by increasing the yields on existing area by better selection and adaptation of crops, and by improved soil treatment. This becomes necessary from another point of view, which was not touched upon by Dr. Harris, namely, the increased cost of labor and the equipment necessary to produce crops. It has been pointed out that 65 per cent of the cost of growing a crop is necessarily incurred whether any yield is secured or not. It goes into such fixed charges as interest on land, cost of plowing and fitting, cost of seed. The tendency is for increased yields produced by the use of fertilizers and lime to increase the profits out of all proportion to the cost, especially for the lighter application which produces the largest unit increase.

Lime and Fertilizer Decrease Cost of Production

Since so large a portion of the cultivated land of the country needs lime it is vital that this need be appreciated and the methods understood for its proper application in cooperation with fertilizer materials and good general soil management. It was said recently by a well known agronomist that all of the most prosperous farmers in his state used fertilizers and it may be said with equal truth for many sections of the country that the most prosperous and most progressive farmers also use agricultural lime. It should also be noted that the farmers on the poorer lands, even less than those on the better lands, cannot afford to dispense with the use of such materials as lime and fertilizers in reasonable quantities.

A FINANCIER

Jobson, driving along a lonely road one morning, managed in some way or other to ditch his car. Fortunately, a farmer hove in sight behind a pair of stout horses and Jobson appealed to him for help.

"Why, ya-as, I guess I kin help ye out, mister," said the farmer. "Let's see what it'll come to—one day's use of the team, $5—"

"One day?" retorted Jobson. "'Tisn't going to take a day to haul that machine out, is it?"

"Why, no," returned the farmer, "but arter I get the $5 I don't calc'late to do any more work till tomorrow."—Boston Transcript.

The enviable reputation built up by Dixon & Griswold during their career as jobbers of farm implements in Southern California is a prominent factor in the decision of W. L. Dixon and J. F. Griswold to re-enter the field under the old firm name. It has also caused an elaboration of the policy formerly pursued by this enterprising firm, into an expansion of territory covering the entire Southwest, particularly California and Arizona. Such well known and established lines as those put out by J. I. Case Plows Works Co., La Crosse Plow Co., Sandwich Manufacturing Co., The Bean Wagon Co., will form a nucleus about which will be built the most complete jobbing stock ever distributed in the Southwest.

The firm will resume business at a temporary location at 130 North Los Angeles Street, Los Angeles, until it is possible to obtain possession of a building recently purchased by them at 114-116 North Los Angeles Street.

Save Labor and Increase Your Crops

Planet Jr. implements do your seeding, cultivating, furrowing, hilling, etc., easier and in a fraction of the time required by old methods. They work accurately and thoroughly, placing the seed just where you want it, turning the soil in the way best suited to plant growth. Better crops result.

No. 25 Combined Seeder, Double and Single Wheel Hoe does everything that can be done by a wheel hoe and a seeder. Its all-around usefulness on a large garden or small farm is unequalled by any other implement.

Write today for our 72 page illustrated booklet, describing all Planet Jr. implements, their construction and use on the farm, or in the home garden.

Best for Every Farm Use

Red Seal Dry Batteries

Avoid ignition troubles by using Red Seal Dry Batteries. These batteries are in reality convenient storehouses from which electric current can be drawn at will. They furnish fat, hot sparks that spur your tractor or farm engine into action and **keep it running at par.** Recommended as the most efficient, satisfactory and economical medium of **ignition for all purposes.**

The Guarantee Protects YOU!

Under every condition, regardless of weather, and no matter how rough the going, these famous batteries will supply you with reliable farm power at least cost. Thousands of tractor owners will use no other! Absolutely best for tractors, farm engines, autos, door bells, hand lanterns, telephones, etc. Study the label! Insist on genuine Red Seal Dry Batteries.

ASK YOUR DEALER

Under our plan, every dealer's supply of "Red Seals" is always fresh. No chance for you to get run down stock. Ask for them by name.

When you buy Red Seal Dry Batteries, ask your dealer for FREE book, "How to Run the Gas Engine" our famous handbook for engine owners.

Adventuring With Chickens

By Jean A. Koethen

DEAR Dad:—Here it is two whole weeks since I wrote you a line. If you could only guess what busy weeks they have been and how I have slipped into bed night after night, figuratively if not literally, "with the chickens," almost too sleepy to say my prayers, you wouldn't think me neglectful. What is it about this California climate that makes us tenderfeet so sleepy, even when we are not working 14 hours a day?

Bob has gone to association meeting tonight with Mr. Sayers, our next door neighbor. We have found Mr. and Mrs. Sayers a wonderful help in getting things started. Hardly a day passes that they are not in with some suggestion, and we are humble enough to accept it all gratefully. They are not big chicken people, only keep a few hundred hens, "on the side" as they say, for Mr. Sayers works in an office in the city and has only Saturday afternoons and summer evenings for his poultry. Being sideliners, they have worked out every possible labor saving device, and their backyard plant is a wonder of neatness and economy.

And what do you suppose I have been doing today? You'd never guess. Mrs. Sayers put me up to it. She says you can hardly make a vine grow on a chicken fence after the chickens are inside, so the time to plant vines is now, before we have any chickens to eat them off. She gave me some honeysuckle roots, and I bought Cecil Bruner roses and Australian pea seeds. Planted now, before the rains come, they ought to be well started by the time my little chicks are old enough to eat the leaves off. Indeed, they will not be in much danger till a year from now. I wanted to plant morning glories or moonflowers, but Mrs. Sayers discouraged me. She says when once they get started you can never get rid of them. I have planted the honeysuckle along the fence that encloses the layers' runs. The house is to front south, and its westermost fence will catch a good deal of wind. As the honeysuckle makes such a thick growth it will make a good windbreak, and it ought to be well grown by next fall. Mrs. Sayers' hens are comfortable against their honeysuckle hedge in the windiest weather.

The roses are on the brooder yard fence nearest the house. They will not only be a windbreak but will hide whatever is best concealed. I must quote Mrs. Sayers again: "Why should our back yards be ugly when we have all nature to help beautify them?" Somewhere lately I read that her back yard is the truest index to a woman's character. Isn't that a thought to keep a woman on her mettle?

The Australian peas I have planted beside the fence which encloses what is to be the colony house yard. I feel a little doubtful about them. They have a reputation for not being easy to start. For fear they should disappoint me I have planted a pink tecoma vine right in the middle of the south side. If worst comes to worst, it will cover that fence by itself, Mrs. S. says.

We had not planned to build all our fences ahead of the houses, but the vine and tree consideration ruled. From now on is tree planting time, and the trees we plant for shade, like the vines which cover the fences, must get the start of the chickens. From all we can learn walnuts are proving the best trees for poultry runs. They grow slowly, to be sure, but in the end they give glorious shade during the summer and none at all in the winter, and the income is considerable. We are going to plant them 40 feet apart through our yards and put peaches between. By the time the nuts need all the room the peaches will have paid for themselves, and some more, and they will give us some shade next summer.

The need of shade and green feed seems to be acute in Southern California. Everybody plans for shade for his hens, just as everybody is thinking about greens. That is a thing that strikes one queerly, that in the fall, when the Kansas farmer is getting his crops in and thinking about the long rest he is going to have, the Californian is planting grain and vegetables and fixing up his winter garden.

We are going to plant barley in our runs and in every other place where we are not ready to plant something else. It will be fine for the chicks to run on, and if there is any we do not need for them we can put it away for scratching litter for the pullets next fall. Mr. Sayers already has barley up in several runs he is not using. He plants it early and then waters it with the hose. When it is six inches high he cuts it and runs it through a clover cutter for his layers. He says one secret of successful poultry culture is never to leave well fertilized soil idle. The barley uses up the accumulation of manure in the soil and turns it into feed. If it has been contaminated by worms or any intestinal disease the barley purifies it. When he has cut one crop of barley he waters again and another crop begins to grow from the same roots.

Speaking of barley reminds me of the trip we took the other day, Mr. and Mrs. Sayers and Bob and I, in our new flivver. We drove 50 miles and back just to visit a man who is said to have one of the most complete poultry plants anywhere around. This man, Mr. Warren, has two large yards for every house, one in front and one behind, with a door opening from the house into each. In the summer he plants Sudan grass in the rear yards and lets the hens run in the front yards. In the winter he plants barley in the front yards and keeps the hens in the rear yards. Now, I do not mean, as you might suppose, that he plants the barley, and as soon as it is grown turns the hens in on it. I thought that was what was meant by "double-yarding," but I know better now. As soon as the barley is well grown he begins to cut, cutting enough each day to make a feeding for all his hens when it is run through the clover cutter. As soon as he has cut clear across the yard he turns the water in on the roots, gives them a thorough irrigation, and starts them growing again. After three crops have been grown and cut he turns the hens in to eat up the roots.

"But surely it would be easier to turn the hens in and let them eat their green off the stem," I objected,

POULTRYMAN'S CALENDAR—JANUARY, STARTING THE HATCH

Whether he actually begins hatching or not, hatching is the subject that is uppermost in the poultryman's mind after New Year. If he does his own hatching he will see that his incubators are in order, thoroughly cleaned and disinfected, thermometers and thermostats in order, and everything ready to go by the middle of the month. If he wants February chicks, his eggs should be in the machine sometime between the middle and the end of January. If he buys his chicks ready hatched he has ordered them long ago, and half of them at least are to be delivered in February.

The farmer who depends on hens for his hatching is handicapped this month by lack of broodies. He may have to take a few dozen eggs to some hatchery which does custom hatching. If there is such a hatchery within reach the early pullets he gets by this means will be more than worth the trouble and expense involved. The backlotter who plans to purchase eggs should have them ordered before this. As a rule eggs can be ordered subject to call, that is, to be delivered when the hen is ready. Everybody should plan for some February chicks, and January is the time to set things in motion.

Our free book Chickens from shell to Market gives full particulars

Coulson Co. Petaluma Cal.

little silly that I am. Mr. Warren didn't even smile. "Yes, it would be easier, but the hens would only tramp down the barley. They wouldn't get much, and all our work would go for nothing. As it is, we get a lot of good green feed, and the hens, when they are finally turned in, get as much as they would if we let them in the first thing." Mr. Warren had Sudan grass half as tall as I am. He has a patch of alfalfa besides, but considers the Sudan and barley better propositions for utilizing the manure in the runs. Next summer I think we must try the Sudan. Now, as it isn't quite time for planting alfalfa, and as alfalfa is a permanent crop when it is planted, we must put our minds on barley.

Now, Dad, if you'll just be patient, I'll try to tell you everything we do. We shouldn't be here at all, in this land of much sun and little rain, if you hadn't given us a helping hand, and we are not forgetting how much we owe you. We want your Bessie's chickens to be the best ever, and when we get rich—oh, well, no use building castles yet.

As ever, with love to the folks,—Bessie.

Poultry Queries

Conducted by J. A. Koethen

Fryers or Broilers

We have been thinking of buying some baby chicks and raising them for market. What kind would you suggest as best suited for this purpose and how should they be fed? At what size can they be most profitably marketed?—R. E. D., Perris.

If you buy chickens be sure that they come from heavy, vigorous stock. There is great difference between chicks of different strains of the same breed, and you must have stock that will grow rapidly or there is nothing in it. They should be early, too, in order to bring the best prices. January chicks are more profitable than those hatched later, and fall hatched fryers are more profitable still. There is a little difference of opinion about the most profitable age for marketing, or rather, I should say, it depends on breed or strain and time of hatching. Leghorns are best sold as broilers from 1¼ to 1¾ pounds. The earlier the better for them. On the other hand, heavier birds, like Orpingtons and Reds, bring a better price if they are kept to over two pounds, provided they can be made to put on the additional weight quickly enough. I met a man last year who was doing well raising R. I. Reds to fryer size, but he brought them to two pounds in about ten weeks, and one has to have good stock to do that. This man fed his chicks mainly on coarse corn meal and beef scrap in separate hoppers. Others feed all chicks alike till they are six weeks old, then put the market cockerels on a moist mash of corn meal, middlings and grounds oats with about ten per cent beef scrap added, and enough cracked corn and milo to keep their digestion in order. R. I. Reds, Orpingtons, Barred or White Rocks and White Wyandottes are all good table birds. As I said in the beginning, weight and vigor are more important than breed.

Marketing Broilers

We have been reading your articles with much interest and all have been of great help to us. We are trying to raise broilers for market and think there must be some better way to sell them than just to the buyer who comes out here, who pays two cents below market price. We will have 50 or more broilers a week and would like to get in touch with some good place to market them. — M. P. F., Rivera.

The best way to dispose of broilers, when you can contract for a given number weekly, is to some big hotel or restaurant. Any of the larger hotels, I understand, or clubs, are good customers. The only way to do is to write to or see the steward or buyer at the various places. The Poultry Producers of Southern California is marketing Leghorn broilers for its members, but you cannot be a member unless you have a certain number

(Continued on Page 95.)

8,000 Miles GUARANTEED Without Punctures or Blowouts

WRITE TODAY FOR FREE BOOKLET Describing In Detail the Merits of the Dayton Airless Tire

Dayton Airless

They can't puncture—They can't blow out.

No pumping or patching or roadside repairs.

Ford, Maxwell and Chevrolet owners are getting 10,000, 15,000 and 20,000 miles of wear, in all kinds of service—on passenger cars and trucks—under all kinds of driving conditions.

Nothing can happen to Dayton Airless Tires but w-e-a-r. Nothing stops them until they are worn clear down to the last pier of rubber. Remember — without punctures or blow-outs.

Do you use 30 x 3, 30 x 3½, 31 x 4 tires? If you do, spend your money wisely — buy Dayton Airless. It's true economy.

The next time you drive around our way, STOP—AND LOOK THEM OVER.

Corn: Bulk, Yellow, 1.75@1.87½; White, 1.86¼.

Wheat: Mixed feed, Mont., 34.00.

Barley: 1.72½@1.78¾.

HAY

Alfalfa Growers of California, report under date of January 12:

The market for alfalfa hay developed a steadier tone during the week, after the decline caused by the heavy shipments from Nevada, mentioned in our previous letter; while prices did not change materially, they show a marked stiffening up at the end of the week. The most encouraging event of the week in the general situation was the passing over the President's veto of the war finance corporation measure.

There were 720 tons received on the January 8, 1921, with 100 tons held over as against 880 tons the week before.

Rabbit	41.00

HAY

Alfalfa Growers of California under date of January 12:

There were 595 tons received in San Francisco the week ending January 8.

No. 1 Dairy Alfalfa	22.00
Standard	20.00

Under date of January 10, A. W. Scott Co. says:

With various fluctuations the hay market rests today with prices generally from $4 to $5 per ton lower than those ruling a couple of weeks ago and early in December. Receipts continued to be light last week. Pasture conditions are ideal and the depression in the meat markets has so far reduced the demand among

Citrus Markets

Los Angeles, January 12, 1921.

The orange market is showing nothing spectacular, but is fairly well cleaned up and the shipments well received. F. o. b. prices are ranging around $3.00 and $3.25. Fruit is running heavily to small sizes, so much so as to prove embarrassing in some sections. It is now estimated that the Navel crop will total close to 25,000 cars, or about 25 per cent greater than last year.

The lemon market is slightly improved, but with long distance yet to travel before great satisfaction will be felt by the grower. Occasional f. o. b. sales have been made as high as $12.50. Only about 15,000 boxes of foreigns are on the docks or in sight.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 1,987 cars; lemons, 872; total, 2,859. To same date last season: Oranges, 4,143; lemons, 676; total, 4,819. From Central California to date, this season: Oranges, 3,808; lemons, 40; total, 3,848. To same date last season: Oranges, 3,328; lemons, 132; total, 3,460. From Northern California to date this season: Oranges, 293 lemons, 3; total, 296. To same date last season: Oranges, 260; lemons, 20; total, 280.

POULTRY QUERIES

(Continued from Page 93.)

of eggs to market every week, at least I think that is necessary, but you might write to 1560 Industrial Street and ask. There are also several big commission and wholesale markets that take broilers, but I doubt if you would get more than two cents under the market, and you would have the expense and trouble of shipping.

Ration for Breeding Turkeys

I have a flock of turkeys for breeding stock and will have rice to feed them on. What other grain or material should I feed them?—G. A. W., Corning.

Breeding turkeys will thrive on any mixture of grains. Corn, wheat, barley, milo, oats, in any combination, provided it is a mixture and not one grain alone. I do not know how large a part of the ration you can make rice. You can tell by experimenting a little. It would be best to use at least two other grains with it, say wheat and corn, or barley and corn. Oats are valuable for all breeding stock. If you have not the whole grain, try giving bulk rolled oats as often as you feel you can afford them. Rolled oats are expensive feed, but there is nothing better for fertility. Be sure they have plenty of green all the time. Range is almost essential for breeding stock.

Pepper Pills for Pale Hens

Mrs. Miles Standish of Twin Gaps sends the following prescription for ailing hens, which we are very glad to have:

"If Mrs. C. P. C. of Fillmore will give her ailing hens a red pepper (cayenne) pill I do not think she will have any more trouble. This is an old formula, but I have never seen it in print. When I discover a hen that acts droopy and listless, refuses to eat and often stands with the wings slightly drooping I just give her a red pepper pill and the next day she is as well as ever. Ducks and pigeons will respond to the same treatment. I take about as much red pepper (the kind that comes in small cans for table use) as will rest on the point of the small blade of a pocket knife, and work it into a bit of fresh bread, making a pill about the size of a pea, and put it down the hen's throat, a little to one side, so as not to choke her. I have never had to give a second pill, nor have I ever lost a bird affected with this ailment. A teaspoonful of cayenne pepper in a glass of warm milk will cure a cold over night in a human being. It is not as difficult to swallow as one might imagine, and I have never known it to fail."

Pork a Poison?

I have heard and have also read that pork is poison to chickens. Now I would like to know if pork crackling is harmful to feed.—Subscriber, Redlands.

As far as I know, no food that is wholesome for human beings is poisonous to chickens. There are some condiments which cannot properly be called foods, which cannot be eaten safely by either man or fowls except in very small quantities. Salt, for instance, while a little is generally used in the dry mash, is deadly poison to fowls if they are able to help themselves freely. I read recently of a lady who by mistake used salt in a cake in place of sugar. The cake was thrown to the hens and killed them. Another threw the rock salt used in making ice cream out on the hens range and lost most of the flock. I have never been rich enough to feed bacon to fowls, but I should not wonder if it contained salt enough to be injurious. Certainly there is nothing harmful in pork any more than in any other meat, and the only objection to pork crackling is that if used too freely it would make fat rather than eggs. For birds that are to be fattened it would be excellent.

NEVILLE ON GOPHERS

During the last weeks of last year the Los Angeles farm bureau gave many talks and demonstrations on gopher control, with the aid of Lorne S. Neville, in charge of rodent control for the county horticultural commission. These differed little from those previously written of in the Cultivator. One new point noted was the increased size of poisoned bait. It has been the practice to cut up carrots, sweet potatoes, etc., into cubes one-half inch square and about one inch long. It has been found that large gophers can store these in their cheek pouches and so carry them to the storehouses. Larger baits are eaten, therefore never make cubes less than an inch long and not more than one and a half inches.

The first wool sale of the season in New Zealand resulted in selling only 2,500 bales of fairly representative classes of wool. The highest price paid was 14d (28 cents), most of the wool selling around 12½ and 13d. Some poor stuff sold as low as 6½.

WEATHER REPORT

San Francisco, Cal., January 8, 1921.

Choice of Leading Water Producers

Millions upon millions of gallons of water are produced every day in the year by Layne & Bowler Pumps. It is interesting to note that the best known ranch and development companies and the most successful ranchers in every pumping district in California and Arizona are now operating these pumps. We here list just a few of the 6,000 or more Layne & Bowler pump owners:

	No. of Pumps
Sacramento Valley Colony Co., Hamilton City	86
Boston Land Co., Henrietta	34
Southwest Cotton Co., Avondale, Ariz.	32
R. P. Davie, Marinette, Ariz.	31
Tuscon Farms Co., Sahuarita, Ariz.	22
James Ranch, San Joaquin, Cal.	22
Bastanchury Ranch, Fullerton	15

The Feed that "shows up" in the flow

Milk, milk, milk—that's the test that tells! That's the only way you know what your cows are doing with the feed you give them. For the feed tells in the flow! It reflects your judgment and mirrors your management.

When you get to the bottom of the milk question you find that it simply trails down to this: you can't get *out* of cows what you don't put *into* them. And, under present conditions, you can't expect them to yield real milk-money unless you give them a grain feed. That's the clue and cue to your profit!

You may say alfalfa hay is the ideal roughage—and it is! But alfalfa alone is not enough. Because no one feed contains the exact proportion of protein and carbohydrates that every cow in your herd needs to make her a profit-producer. But—

Mix alfalfa and SUREMILK *together*—and you have a really balanced ration. You get the right amount of protein. You get the right amount of carbohydrates. You get the right amount of bulk or roughage.

SUREMILK is a highly concentrated grain feed. It is rich in carbohydrates—containing nearly 64%. It is very low in moisture, ash, fibre and protein—for alfalfa hay or other roughage will supply these more cheaply.

If you want to see how SUREMILK will increase the flow of your herd and decrease the cost of milk-production, send for the new edition of our booklet, "Converting Feed into Money." Simply cut out the coupon and mail today—it's free!

Vol. LVI — January 22, 1921 — No. 4

Summary of Crop Production for 1920

THE king of all crops grown in the United States, at least as determined by farm value, is corn. The farm value of the crop produced in 1920, according to the final report of the bureau of crop estimates, is $2,189,721,000. That is the valuation placed on 3,232,367,000 bushels. It is a bit surprising to learn that the second in the honor list of all crops is hay; its total production in 1919 was 108,233,000 tons. The average farm value for this past year has been placed at $16.72, making a total valuation for the year for all hay of $1,809,162,000. Third in importance comes wheat with 787,000,000 bushels, average value per bushel $1.443, or a total valuation of $1,135,806,000. Potatoes prove a most important crop with a production of 430,458,000 bushels valued at $500,974,000. The country's sugar beet production was 8,545,000 tons with an average valuation of $11.63 or a total of $99,396,000. Rice production aggregated 53,710,000 bushels, at $1.189 per bushel, with a total valuation of $63,837,000. This is practically half the valuation of the 1919 crop. Another crop which shrank nearly half in valuation was beans, the valuation of which in 1919 was $51,051,000, while the past year's crop was valued at $27,114,000. The kafirs or sorghum grains, nearly held their own in the two years, in fact, the production greatly increased, being for the past year 143,939 bushels, this as against 127,000,000 bushels in 1919. The valuation for the 1920 crop was $131,665,000.

Some wonderfully interesting reading as to California's production of field crops is shown in the California crop report compiled by Leon M. Estabrook, G. H. Hecke and E. E. Kaufman of the federal and state departments of agriculture.

The two California crops which have suffered most by the deflation process have been rice and beans, both these crops having been shaded in valuation more than 50 per cent. The bean crop of California is divided up as follows: Limas 1,080,000 bags; Small Whites, 150,000; —(Continued on Page 107.)

FIELD CROPS

Crop		Acreage	Production Total	Unit	Per Unit	Farm value December 1 Total

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EDITORIALETTES

As may be noted in the information given in the center of this page last week, and continued with more complete tabulated facts on the cover this week, California has produced as a rule slightly less tonnage than last year. The two tables given on cover page have to do only with principal California crops. General statement of a few of the staple crops of the entire country precedes the comment on the California situation. The facts there given speak for themselves better than any comment we can make, but we are going to call attention to one phase of the situation, and that is the matter of the market for this immense output. Under war conditions any food which would support human life was transported as quickly as possible to consuming centers and the producer drew his money—not always as large an amount as he felt it should have been under labor and other conditions existing. That is past history.

* * *

The speed up production program created a situation which calls for some serious thinking on the part of the producers. Many maintain that it is not their province to think on the question of marketing, that the marketing problem calls for experts in its line as does production. But the expert has a failing in not being able to consider the rights of the producer in time when great advertising campaigns and proper distribution are required. Thus the producer, if not qualified to solve his own problem of distribution, should cooperate with his neighbor and employ one who is qualified.

* * *

It is definitely established that the truest cooperative success is secured, not in combining and holding for a certain price, but in uniting in the effort to secure greatest consumption and through proper distribution secure a fair return to the producer.

* * *

Realizing the educational value of advertising, California growers of peaches and figs, prunes and apricots, raisins, walnuts, citrus fruits, even hay, have united and through advertising vastly increased consumption. Nor is the advertising intended to sell exclusively the brand of the advertiser; today it is generally recognized that similar products filling the market must be disposed of as well as the particular advertised brand. In this particular it cannot be gainsaid that advertising of California oranges increased the consumption of Florida grown fruits as well, and for the fruit to enter consumption is far better than for it to act as a dead weight in the market and bear prices because of glut.

* * *

In this particular the canning industry has its problem. A big crop, we hope, is to be given to us next summer. This means a most serious consideration of the situation by the canner, even the cooperative canneries, of which there are many in California. Writing on this point, R. G. Spencer, organization manager of California Cooperative Canneries, says: "It is well to consider the tremendous growth of the canning industry during the war period, reaching its culmination in 1919 when the total pack of fruits amounted to nearly 14,000,000 cases, three and one-half times the average for the five years preceding the war. The short crop of apricots brought lower figures in 1920, amounting to 11,500,000 cases, but the figures for last season showed the highest point ever reached for cherries, pears and cling peaches. With this tremendous increase in production, and facing a constant growth in acreage and tonnage of all canning fruits, we enter the new year with barely half of last year's crops sold." There must be some heavy buying and consuming if this big surplus is to be absorbed.

* * *

We had expected to have quite an extended article on the various kinks in the income tax returns which must be made before March 15. This article will be given next week. Meantime the farm bookkeeping system may be whipped into shape and balance sheet made so as to leave but a few minutes job as soon as the blanks may be had. As was the case last year, the blanks are not available, but will be "manana." There is no material change in the form of the blanks or facts required from last year. The rate will be identical.

* * *

Congress was never watched by the farmers as this year. There will be but few farmers who will be ignorant of the vote of their congressmen. Humboldt County farm bureau is conducting a campaign, in fact, we imagine it is a general campaign the United States over, and one of its measures consists of distribution of a small handbill headed "Congress knows farmers of the nation are united," and ends with "In union there is strength." This strength is manifested in the farm bureau by the banding together of a million and a half of the farmers in 43 states of the nation. Thirty-nine of California's counties are fully organized in this great movement. Acts of congress which are antagonistic to the interests of this great class will be met with a big question mark from this fully organized body.

* * *

Sugar, cotton and other growers of the Solid South are joining in the campaign for protection for American produced agricultural products. This, united with the strength of the Pacific Coast and most Middle West producing sections, made it seem for a time that the Fordney emergency tariff bill might pass. Then importing and exporting interests awakened to their danger and protested. At the present moment it is oil that is protesting. These interests are free to predict retaliatory measures on the part of other governments which rebel at America's protecting agriculture. Unfortunately, this opposition meets with support from many a consumer, and the situation as to the temporary relief seems getting no better fast.

GRAHAM A SECOND TIME WINNER

Last minute word from Woll, superintendent of dairy tests, says: "Earl Graham, Compton, has highest average production for five grades during month of December and is entitled to California Cultivator prize." Particulars next week.

IT RAINED

Finally it has rained; it has rained the entire length and breadth of the state. North of Fresno there have been several deep soaking rains, in fact, the ground has been so wet much of the time that plowing and seeding have been impossible. The southern end of the state has been seriously lacking. The rain which began on Monday morning, and is still falling as we write this, will put all fields in best of condition for plowing, seeding and producing a good crop.

OLIVE DAY

Governor Stephens has proclaimed February 21 "California Ripe Olive Day" and "I urge all loyal Californians to join in this effort to extend the use of this distinctive California product, thus promoting the well being of the industry and the prosperity of the state. From the time of the mission fathers to the present time the culture of the olive in California has been one of the honored and distinctive industries of this state. For years the olive, ripened in California's groves, has been recognized not only as one of the earth's most nutritious foods, but also as one of its choicest delicacies."

Now if the governor will allow the grower who has processed his olives to sell them, a chance to live will be given a portion of the industry. A grower recently remarked: "I have a barrel of finest olives, but do not dare to even give them away."

POOR ETHICS

In the Cultivator of December 18 we referred to the postal savings rate of two per cent paid to the people for funds which are loaned to banks at 2½ per cent, and then referred to the fact that the government turns and borrows money from the banks at six per cent, which it uses in part in buying its own depreciated bonds at around 85. These suggestions were made because of statements seen in other papers. We wished more definite information at first hand, so we asked and have just received from the assistant secretary of the treasury:

"For the secretary of the treasury I acknowledge receipt of your letter of December 21, 1920, addressed to the director of the savings division of the treasury department and inquiring whether the government is buying its own bonds at a discount. I assume that you refer to purchases of Liberty bonds and Victory notes for the bond purchase fund or the cumulative sinking fund. I am therefore enclosing in reply extracts from the annual report of the secretary of the treasury for the year 1920 under the headings, 'Retirements of Liberty Bonds and Victory Notes' and 'Cumulative Sinking Fund,' which describe these purchases and the reasons therefor. I enclose also a copy of the special report of the secretary to congress dated December 6, 1920, as to the details of operations under the bond purchase fund authority.

"You have been misinformed as to both postal savings funds and treasury certificates. The board of postal savings trustees carries the greater part of the postal savings funds, up to the limit authorized under the law, invested in government obligations. Postal savings deposits in the banks are reduced to the minimum. Treasury certificates of indebtedness are now held for the most part by real investors and only to a very limited extent by the banks. The high rates of interest on treasury certificates, far from being the cause of the present money stringency, are merely the result of the same world wide scarcity of capital and credit which affects not only private borrowings but government borrowings as well. For your information in this connection, I hand you herewith a copy of Secretary Houston's letter of December 8, 1920, to the banking institutions of the country."

The statements accompanying the letter refer to the various purchases of Liberty and Victory bonds and give prices paid. From the extended report of the secretary of the treasury it appears:

"It is also interesting to note, in view of the widespread contention that purchases should have been made at par rather than at the market, that this very proposal was rejected by the committee on ways and means, when the matter of granting the authority was under consideration. The secretary of the treasury in his testimony before the committee said in this connection: 'I do not think it would be a wise thing for us to attempt that—that is to say, to purchase the bonds at par—because I think if we were to state that we had $100,000,000 that the government would invest in these bonds at par, for instance, that would simply be an invitation to the people to sell their bonds to the government at par and you would exhaust the fund in short order.'"

Notwithstanding that, and the further claim that purchase of the bonds at market price by the government, and then retiring them, aids in stabilizing, it does not appear to us that our government stands in the best light in the eyes of the people in buying its own bonds at a discount.

Walnut Growers Meet

By Ernest Braunton

THE third annual walnut growers institute was held at Whittier, January 14, under joint auspices of the agricultural extension service and Los Angeles County farm bureau. The attendance was more than 300, several coming from as far as Santa Barbara County. The meeting was called to order by Walter W. Wood, director of the Whittier farm bureau center, who introduced the chairman, Robert H. Neely, president Los Angeles County farm bureau.

Robert W. Hodgson, farm adviser, was the first speaker and made an impressive plea for the organization of a county walnut growers department of the farm bureau, recounting what material advantages had accrued to local dairymen through their department. The next speaker was H. C. Sharp, at the head of the field department of the California Walnut Growers Association, on the subject, "Importance of Maintaining a High Standard of Quality in California Walnut Shipments." He prefaced the reading of his paper with the statement that the walnut market was never better than it is today and that all nuts stored in warehouses would be immediately sent out. "We must maintain a high quality, a fine appearance—a good shell, a good meat. If one buys a pound of Brazil nuts and half are bad he buys no more, for there are no brands or grades. But if one buys walnuts, unbranded, and they are poor, he is gradually coming into the full knowledge that there is a brand that is uniformly good, that is at all times dependable. Therefore he returns and buys good nuts. Care on the part of the grower will aid much in maintaining this high standard. Slowly but surely the California nut is becoming recognized as the best. The future is full of promise."

Next on the program was Ralph E. Smith, who spoke on new developments in dust spraying, with particular reference to aphis and red spider. He told of examining culls to determine why they were culls and the factors contributing to their discard. He found culls were due first to blight, for which no remedy has been found. Then come aphis, codlin moth and red spider. It is highly desirable to keep all these pests away that all the leaves may be kept on, and kept on as late in autumn as possible, to build a vigorous, resourceful tree that alone can produce a good crop of good nuts. These pests may be controlled by dust spray. Some years they are bad; some years the numbers are so few as to be of no concern. It is best to get ready to spray each year, at a day's warning, even as the citrus grower is ready with his smudge pots when the need presses, especially in districts generally afflicted. Such provision is good insurance. Nicotine is the active agent for aphis and sulphur for red spider, but the former is not a deterrent, as its effect is potent for but a few hours. "Professor Quayle will tell of codlin moth control, so I will not touch upon the subject." Major Walter Linebarger, candidate for congress from the ninth district, was in the audience to learn of the needs and wishes of the walnut growers in regard to legislation, and was called to the platform to explain his presence, which he did in a very satisfactory and non-political speech of marked brevity. A resolutions committee was appointed and then came adjournment for basket lunch, coffee and cups being provided free by the walnut association.

The Afternoon

The committee on resolutions reported with a wording recommended to be sent to the association's representatives now at Washington and to both of California's United States senators, urging a protective tariff on walnuts, which report was unanimously adopted. Prof. H. J. Quayle of the Riverside experiment station next spoke on control of the codlin moth. This pest was first noticed as attacking walnuts but five or six years ago, and during the past two years, does not appear to have increased much in the sections first infested. But it has appeared in four new and well defined walnut growing sections, giving some growers much concern. During the past year the first brood hatched was very light, but the second hatch was heavy.

The arsenical dust or spray (arsenate of lead) is the only effective means of control, and should be applied (1920 at least) for the first brood the second week in June and for second brood the last of July. It has been found in practice that one spray, either of dust or liquid, is all that is economically justified, as the second application does not sufficiently further reduce the per cent of infested nuts. One plat showing 16 per cent wormy nuts, sprayed in 1919, showed but a 6.3 infestation in 1920, though unsprayed. Many charts were shown and figures quoted to show the great benefits derived from spraying and how easily the pest is controlled by this means. The best time for the work is generally from May 25 to June 20, but this period may have to vary according to prevailing climatic conditions of the season. The cost of both dust and liquid spray has ranged from 60 to 80 cents a tree, but the liquid spray has been twice as effective as the dust spray. To offset this the dust is the cheaper and quicker method and time is often a factor in getting over large holdings or through community sprayings. Neither "wet or dry" program was given preference in recommending treatment. But spray unless the infestation is below three to four per cent.

Dr. L. D. Batchelor, whose name appeared twice on the program, was announced as "down with the measles," and Prof. Vaile was present to read both papers. The first was on "Economic Losses Due to Non-productive Trees," and the second, "Top Grafting Poor Yielding Walnuts." The last subject was fully dealt with in the Cultivator of February 14, 1920, the illustrations showing Dr. Batchelor and Mr. Wylie topworking trees just across the road from where the late meeting was held. "George T. Powell, Ghent, New York, was the pioneer investigator of non-productive trees, working for several decades on apples, and his methods are merely extended for observation of walnuts." It has been found that in blocks of 100 trees, whose crops were separately harvested, that 25 were grown at a loss, 25 just about paid for care, and the other 50 paid the bills and yielded the profits. In another block over two years observance (1919-20), 18 per cent failed to pay; in still another, 19 per cent. It was found that during these two years each tree should have yielded 101 pounds (for the two years) in order to meet expenses. Three methods of procedure are open. 1. Pull out non-productive and give space for remainder to expand. 2. Pull out and replace drones with young trees. 3. Topwork drones. The first is best if trees are close—40-45 feet apart. This is clearly shown in one orchard where in three years one tree produced 249 pounds, the next but eight pounds and the third 217 pounds. If 55 or 60 feet apart, it is perhaps better to replace, or to topwork, if trees are vigorous, but do not topwork stunted or weakly trees, for "a tree is no better than its roots." The J. B. Neff orchard at Anaheim was cited as one greatly improved by topworking. In answer to questions from the audience, it was stated that a mature tree should bear 60 pounds of good nuts each year to be profitable. That the Placentia varies so much in yield and quality of nuts that a better variety is needed, though the best trees are good. That according to President McNeely, George Weinshank and other excellent judges there is none better than the Eureka, though late in coming into bearing. That the Erhardt, Rutherford and El Monte are very promising, the first named especially so. Dr. H. S. Fawcett was unable to be present, but sent a paper on "Foot Rot of the Walnut."

Wet That Subsoil

By Robert W. Hodgson

SOUTHERN California, and for that matter the San Joaquin Valley as well, is today facing its fourth season of either deficient rainfall, greatly delayed rainfall, or rainfall so distributed as to have been largely lost by evaporation between storms. The situation of last year when early rains were enjoyed by the southern end of the state while the north went parched until late spring, is to date almost exactly reversed. The Sacramento Valley has received ample rainfall to insure good crops for next season, while the southern part of the state has received hardly enough to lay the dust.

The fact that for four seasons winter rains have not been sufficient to wet the soil down to the normal depth is one of gravest significance to Southern California orchardists. It bears a very important relation to the success or failure of the coming season's crops and in many cases to the very life of the trees. For quite uniformly over those districts not receiving a normal precipitation during the past four years, subsoils are drier than has been the case in years past, and drier closer to the surface than is conducive to the well bearing of trees and vines.

Apparently there is no substitute for natural precipitation when it comes to establishing satisfactory soil moisture conditions. The slow pattering winter's rain soaks in to a greater depth than is possible to secure with hurried furrow and flooding irrigation. For the signs of drouth have been unmistakably reflected during the season in both the appearance and behavior of practically every variety of tree and vine, and even though supplied with what was considered ample irrigation.

Deciduous fruits failed to bloom and leaf out in the usual normal fashion. The bloom was stretched out over a period of close to two months, with a difference of as much as six weeks between the tops of the trees and the lower branches. Peaches and apricots generally showed all stages from bloom to fruits nearly an inch in diameter at the same time. This condition apparently was worse on dry farmed orchards than on irrigated, but was the rule rather than the exception.

Uneven and spotted setting of the crop was much more prevalent than usual, indicating a condition of weak fruit buds. Fruits dropped late into the season when as large or larger than walnuts, which rendered the early and usual crop forecast almost impossible. Many of the smaller twigs and branches failed to come out altogether, and others showed weak and unsatisfactory growth, frequently rather suddenly dying back. Here and there large branches suddenly died. Shot hole borer, the usual accompaniment of decreased vitality, showed up in aggravated and unwonted numbers.

About the time the fruit began to

Agricultural News Notes of the Pacific Coast

Northern California

The National Pigeon Show was held in Oakland last week.

The California Automobile Club is posting the highways in Butte County.

Glenn County farmers are discussing organizing and affiliating with American Federation of Farmers.

Yolo County people are appealing for improvement of state highway pavement between Woodland and Davis.

Penryn, Placer County, is planning for the construction of a civic center and the remodeling of the present community hall.

The state fish and game commission is suggesting a law which will require us to brand all of our crabs on the back.

Chambers of commerce in various sections of the valley are passing resolutions endorsing the Marshall conservation scheme.

The Marysville-Oroville highway is to be uniformly planted to shade trees. Ten farm centers recently met to consider ways and means.

The California Wool Growers Association in session in Davis recently gave heartiest approval to the Fordney emergency tariff proposal.

The flow of water in the Sacramento River during the past year has been but 40 per cent of normal and in the San Joaquin about 60 per cent.

Mendocino prune growers are discussing the new contract with the prune and apricot growers. It is thought the signing will be general.

Prune growers of Humboldt County have been holding meetings at which they were addressed by H. C. Dunlap and others of the prune and apricot growers.

Superintendent of Rodent Control Jacobsen has word from the biological survey that 25,000 ounces of strychnine has been set aside for feeding to California squirrels and other rodents.

Cattlemen of the state are in conference in Sacramento working for amendments to the Cattle Protection law of 1919. The law has proved beneficial, but certain changes are deemed advisable.

The farm bureau marketing exchange of Eldorado is operating a meat packing plant at Eldorado, where members can bring their own animals for slaughter and have the meat cured for their own use.

The state railroad commission has issued an order reducing transportation charges on rice in carlots 25 per cent. This still leaves the rate for paddy rice on the basis of 125 per cent that of cleaned grain.

Secretary Dudley of the Sacramento County chamber of commerce is going among the farmers to acquaint them with the work of the chamber for the development of the resources of the county and to ask for their cooperation.

The Antioch-Rice Irrigators fight has resulted in a judgment that the town of Antioch is entitled to a fresh water supply and that land owners above must not take out water to such extent as to deprive her of her fresh water. Upper valley irrigators indicate that this is but the beginning of one long fight.

Central California

Raisin Growers are discussing Raisin Day observation.

Reedley vineyardists are attending vine pruning demonstrations.

Mr. Condit is giving fig pruning demonstrations in the Valley.

The Raisin Growers propose to start their campaign for new members February 1.

The Tulare Cooperative Poultry Association will hold its annual meeting January 31.

Dairymen of Stanislaus County are planning for formation of a new cow testing association.

Irrigators are cleaning canals and ditches preparatory to next season's irrigation campaign.

Stanislaus County Holstein Breeders Association is planning for an important meeting early in February.

Stanislaus County Poultry Association proposes to do both cooperative marketing and buying. Its secretary is L. Miles.

Members of the farm center at Dos Palos think membership in the farm bureau should be open to any American citizen.

There was liberal attendance and much interest shown in the discussions at the fig growers meeting recently held in Fresno.

The Lindsay broom factory is a growing institution which is now paying to producers from $100 to $300 per ton for broom corn.

Commissioner Collins of Tulare is giving warning as to the great danger of spread of phylloxera if there is carelessness in setting vines.

Tulare County irrigators who depend upon wells find there is serious fluctuation in levels, some sections showing a lowering of as much as 15 feet.

Fat hog auctions: Tulare, January 25; Visalia, 26; Hanford, 27; McFarland, 28. The association will soon issue its calendar of auctions for the entire year.

Farm bureau directors of Madera, Stanislaus and Merced Counties, meeting at Merced on December 24, protested against present power rates and declared they must be lowered.

The Watsonville section will ship 2,200,000 boxes of apples this season according to F. W. Read of the state standardization service. This is 300,000 boxes less than last year's shipment.

Beekeepers of the San Joaquin Valley are appealing to the board of supervisors of Tulare County to pass ordinance which shall be less stringent than the present one and allow shipping of bees into the county.

Tulare egg producers are not particularly elated over the recent drop of seven cents per dozen. Producers in that county were receiving as high as 80 cents in November. The price is now down close to the 50 cent mark.

Engineers are to make water measurements on the Kings River during the present irrigation season. The work will include gathering engineering data on available water, amount actually used and amount which may be stored on the Pine Flat reservoir.

Southern California

Orange County reports no damage whatever from frost.

There are now 68 irrigation districts operating in California.

Orange County farm bureau is maintaining an employment agency.

Los Angeles County farm bureau annual dues are now fixed at $2.50.

Poultry Expert Eason is addressing poultry people of Imperial Valley.

Potato planters are getting ground in readiness for next season's crop.

50,000 cars of oranges, it is estimated, is the present season's output.

West Riverside farmers declare: "Russian thistle will soon be only a memory."

Blythe, Riverside County, has been shipping its Pima cotton to Phoenix for ginning.

The annual walnut institute was held last week at the walnut packing house, Whittier.

Imperial Valley reports crop acreage for 1921 will be materially under that of the past few years.

Long pruning demonstrations have been held under direction of Los Angeles County farm bureau.

An Australian citrus grower has recently been inspecting citrus orchards of Southern California.

A meeting in the interests of the Prune and Apricot Growers is to be held at Van Nuys, January 26.

San Jacinto, Riverside County, has only a few acres of cotton crop, but the harvest is still progressing.

Dr. Whitten has been holding long pruning demonstrations before the fruit growers of Riverside County.

Lemon growers of Southern California are wiring their representatives in congress to save the lemon situation by securing protective tariff.

A series of dairymen's schools held under auspices of the dairy council and farm bureaus called out large attendance in practically every dairy section.

Deputy State Market Director J. P. Britt is addressing beet growers in the effort to get more perfect organization and an increased acreage planted.

Orange County farm bureau meetings: Buena Park, January 17; Yorba Linda, 18; Capistrano, 20; Harper, 21; West Orange, 25; Villa Park, 27; Garden Grove, 31.

Unless the southern end of the state gets more rain soon it will materially lessen the acreage which will be planted to sugar beets. Sugar prices are also considered discouraging.

Poultrymen of Southern California are finding that the salvation of the industry through the satisfactory prices obtained the past few years is entirely to the credit of cooperation.

Los Angeles County board of supervisors reports: "We have made inspection of the so-called check dams constructed by the flood control department, and we find that where the mountains were burned over after these dams were constructed that the rains of last winter carried the check dams away, in many cases obliterating them entirely."

The Coast and General

Oregon has a campaign to "swat the small prune."

Last year's U. S. pear crop was the greatest ever.

The success of the emergency tariff bill is still most doubtful.

Oregon is working for a tariff on cherries and English walnuts.

Ohio farmers to the extent of 29.5 per cent are operated by tenants.

Oregon has 50,000 acres in apples and 40,000 in prunes, 13,500 in pears.

The Nevada legislature is considering enacting duplicate of the California license law.

Over 6,000 persons registered during Farmers Week program at Columbus, Ohio, recently.

The annual meeting of the New York State Agricultural Society is being held at Albany this week.

The American Farm Bureau Federation is discussing the feasibility of turning our surplus wool into blankets.

Over 4,000 automobiles used the Lincoln highway out of Salt Lake City through to the Coast during the past year.

Peach trees shipped into this state from Utah have been condemned because of peach borer, crown gall and other pests.

Cattle feeders of mountain states are being forced to sell livestock because of continued pressure of banks for liquidation.

Polk County farm bureau, Oregon, has organized a corps of seed inspectors and makes certification of qualities and kinds of seed.

In the effort to relieve the congested rail trasportation the American Farm Bureau is securing a reduction by combining boat and rail shipment.

Michigan wool growers have decided to pool their 1921 clip. Last year's pool, amounting to three and a half million pounds, is still in storage.

Nebraska tourists recently in Sacramento made a tour of the Japanese section of the city and were converted to California's viewpoint of America for Americans.

Four inches of snow in some of the higher pasture lands of Arizona is making for immediate difficulties, but promising sufficient moisture for the summer ranges.

Secretary Lewis of the Oregon Cooperators Association believes that next season Oregon will produce a large crop of apples, while probability of a small Eastern crop offers attractive outlet.

Estimates as to the needs of the national parks in congress indicate that nearly two and a half million will be required. Over three-quarters of a million of this will be needed in California forests.

Oregon Poultry and Pet Stock Show, in connection with which there was an almost continuous program of lectures and demonstrations, exhibited the greatest number of entries ever at the state show.

Oregon livestock ranges, especially in the upper altitudes, have been experiencing some below zero weather and water holes are frozen over so that care has to be exercised to prevent suffering and loss.

Back to Livestock----and Safety

By R. P. Royce

DESPITE a general feeling of uncertainty as to just what the future has in store for producers, the situation is beginning to clarify and those who take the trouble to investigate are beginning to make out certain features on the horizon that will doubtless develop into fairly reliable landmarks by which to guide their operations. On every hand there is a very definite tendency for producers to get down to earth. Men who staked heavily on cash crops the past few seasons and who met up with heavy losses in 1920, due to the drastic deflation of crop values, initiated and overdone by the federal reserve board, have about made up their minds to take their losses and to start again. Unfortunate as conditions have been —and are—there is one hopeful sign developing, viz., many of these one crop men have come to the realization that in the long run a sound system of agricultural practice can only be developed where livestock of some sort is given a place in the operation.

Notwithstanding the fact that livestock is a great basic industry in California, it must be admitted that the average producer of this state has not been a livestock man. The average rancher has been inclined to specialize to a degree not obtaining in other states. He has been a barley grower, a wheat grower, a bean man, a rice man, a fruit man, a grape man or a nut grower. On the other hand, livestock ownership has to a large extent been in the hands of range men, specialized dairymen and, in the case of hogs, specialized hog raisers. None of these plans, save that of range operation, is sufficiently sound to endure. What the state of California needs and must develop is an agricultural system that combines specialized crop production with livestock production —and happily we are beginning to appreciate that fact.

The time has come when we in California must realize that notwithstanding the fact that we are blessed so abundantly with natural resources we cannot continue for all time to operate on a system that has fallen down in every land practiced—a system that ignores the fundamental need of livestock in the maintenance of soil fertility. But having come to such realization it is equally essential that we catch a clear understanding of what part in practice livestock production will or can be expected to play.

The soil is the nation's greatest asset, the value of which, in the end, must be measured by its productivity. Productivity is measured by fertility; fertility is measured by the amount of available plant food; and finally, the amount of available plant food is dependent upon manure from livestock sources.

From the above facts modern agricultural practice has fixed the part that livestock plays in maintaining a successful agriculture, and therein lies the justification for urging that livestock of some sort be incorporated in the cultural practices of California. Even now, with our agriculture in its infancy, so to speak, in communities where specialized production has made large progress the problem of fertility is of most pressing moment. This condition is especially to the fore in the southern citrus district. The resources of hundreds of acres planted to groves have become so depleted as to require heavy applications of animal manure. Indeed, in the vicinity of Los Angeles the shipment and trade in manure has reached large proportions and thousands of tons of manure have been shipped in from the feedlots of Nevada. The rapid using up of that source of supply, together with the increased freight rates and labor costs, are factors that point to the inevitable necessity of securing such fertilizer nearer to the point of application.

Doubtless there are many who will not agree with the statement that the citrus and deciduous industries of California are dependent upon the development of our livestock industry, but the writer feels confident that time will prove the correctness of that assertion notwithstanding the known possibilities of green manure crops. As a matter of fact, back of the marked expansion of the livestock industry in Southern California during the past few years is the growing appreciation on the part of the progressive orchardists of the practical value of livestock.

The folly of a community depending upon a single crop is nowhere better illustrated than by citing the predicament of the cotton growers of the Imperial Valley and Arizona. In those sections, once famous and prosperous because of the dairy industry, the war prices for long staple cotton caused virtually a complete liquidation of dairying. When the slump in cotton values came, hundreds of planters found themselves facing the most serious condition of their lives. They could not sell their crop to pay their loans at the banks—yet they had to live. The writer has it on the word of a prominent financial operator that today the cotton planter has but one way out—he must somehow buy back the cows he liquidated and reengage in some form of dairying.

The writer's informant went on to state that in his judgment the present disaster would prove a real blessing in that it would make plain to the ranchers of that section that in the future their safety lies with livestock, that even though the profits might not be spectacular, they would be certain and over a period of years the average man would be "ahead of the game."

Farther north, over in the San Joaquin and Sacramento Valleys, livestock is coming to occupy a more and more conspicuous place. Each of those great valleys is potentially a great livestock center, and by the very nature of things will develop with livestock. But in order that the industry develops on a sound basis it is important that ranchers understand the real place of livestock. It is not necessary that livestock production be made the main business of each ranch; rather is it advisable that livestock be kept as an adjunct to one's operations. Keep livestock to consume as much of the crops pro-

A Bunch of Black and Whites in California Summer Pasture

Pure Breds Which Have Been a Factor in Building Up the State's Meat Producing Industry

OilPull No. 174 and its owner, C. J. Chandler Lincoln Kas

1909—1921
A Remarkable Record of OilPull Performance

Twelve years ago at the start of the tractor industry the first OilPull tractors were built and during this time these pioneer machines, such as "Old Number 1," No. 8, No. 9, No. 11 and others, have built up a record of dependability, economy and long life that is unequalled in the tractor industry.

And it should be remembered that this record is based on not a few years' performance of one or two tractors but upon the work of hundreds of these first OilPulls over a period of many years.

In these twelve years, OilPull tractors have not only proved their remarkable ability to work steadily and constantly hour after hour, day after day, but they have also established the OilPull unbeatable record of economy. Economy of operation—being real kerosene burners and the only tractors guaranteed in writing by the makers to burn kerosene under all conditions. Economy of upkeep—there being hundreds of cases like that of the first OilPull built, and still in use, whose owners vouch for the fact that in twelve years their repair bills have not exceeded five cents per day.

This is *your* kind of a tractor—one that will give many years of dependable, constant service.

Four sizes—12-20, 16-30, 20-40 and 30-60 H. P.—give a wide range for selection. Ask for catalog.

Planting Tropical Fruit Trees

By Ernest Braunton

AS this article is intended rather for the home orchard than for commercial acreage, we will begin with citrus trees—oranges, lemons and pomelos. From this it must not be inferred that they are the first to be planted, for several other tropical and subtropical fruit trees are hardier than the citrus.

Dig holes deeper and broader than is needed for reception of the balled tree. If soil is heavy, the holes cannot be dug too large. Fill these in until about deep enough to receive the ball, and settle with water. This should be done a few days (or weeks) before planting, and is the better plan for all trees. Mix fully decomposed stable manure or coarse commercial fertilizer well into the soil before replacing.

Handle the balls of earth carefully, for they should not be broken. Leave

Fuerte Avocado

burlap on; it soon rots. Fill in soil two-thirds up on ball of soil, tramp it firmly and then cut cords about stem of tree and carefully lay back burlap so it may be under the remaining one-third of soil. Do not roughly handle the tree so it will be loosened in the ball. Fill in remainder of soil, leaving a basin about the tree, and water thoroughly, filling the basin at least three times. Carefully irrigate and lightly cultivate, every ten days in light soil and 15 days in heavy soil, and continue so for the first season. These directions will do for all balled trees. Plant in March in light soils, later in heavy soils, but never earlier.

Avocados

Avocados need the same general treatment as citrus trees. While it may not be advisable to plant them earlier than we do citrus trees, their behavior would suggest such procedure, as they start new growth earlier in spring. The reason no doubt is that citrus trees are natives to hot lowlands and require heat, while avocados are natives (Guatemalans at least) of cool uplands and will therefore grow in cool weather, in both spring and autumn, and in many varieties grow little or none in late summer.

Where frosts are light or few, plant a month earlier than citrus trees. Avocados need good soil drainage or roots will rot, the wood being softer and more pithy than that of citrus trees and the trees rooting more superficially, therefore will grow on thinner soils. Coming from cooler climates, they sunburn more easily than orange trees. Protect trunks of young trees with yucca shields and place thin burlap or cheesecloth on four stakes on south and west sides and south half of top of enclosure for at least first season, especially if in hot, dry districts. To restate, allow sun to fall on plant until ten o'clock, but never later. Pruning is seldom necessary except to keep trees shapely and well balanced. Nip off tender leaders if inclined to shoot upward, for trees should be low and bushy rather than tall and columnar.

Other Subtropicals

Feijoas or Paraguay guavas are hardy throughout California and require little attention in any soil or situation. If growing too straggly, shorten side branches. Cherimoyas do not thrive so well in heavy as in medium light soils, but are as tender as avocados. Allow outer branches to droop to ground; they fruit heaviest on such growths. Do not water often in soils retentive of moisture or of poor drainage. Sapotes are hardy trees and need little care. When young they are very aspiring and this youthful exuberance should be checked by occasional nipping of terminal growths. With maturity they become umbrageous trees. Mangos should be planted only where there is practically no frost, shaded from sun for first year or two, trunk protected from sunburn and the whole tree protected from the occasional frost that may come, for permanent injury often comes from temperatures close to the frost point, or about 30 degrees. Older trees will endure lower temperatures, but the mango is more tropical in its needs than any other plant herein listed.

AVOCADO ALLURE

Thos. H. Shedden, a former president of the California Avocado Association, recently received the following letter, with enclosure noted, the latter being about one-half the market value of the fruit purloined:

"Proprietor Florimel Orchard, on the Hillside back of Monrovia, Calif.

"Sir—I am back again in the 'glorious climate of California,' and will enjoy it all the better if I square myself with you.

"Sometime last winter, in driving out along the hills back of Monrovia, one day, I slipped into your orchard and got away with four of the biggest alligator pears I ever saw,' when no one but God in the blue sky was looking.

"There was a lady with me, and I'll say, like Adam, 'she put me up to it.' We took them back East, and they were 'fine eats,' but they disagreed with my conscience, and in order to ease it, I am sending you, herein, a good, clean two dollar bill, for the 'conscience fund,' which no doubt you have.

"I remember the pretty name of Florimel, at the gate, and I hope you will get this.

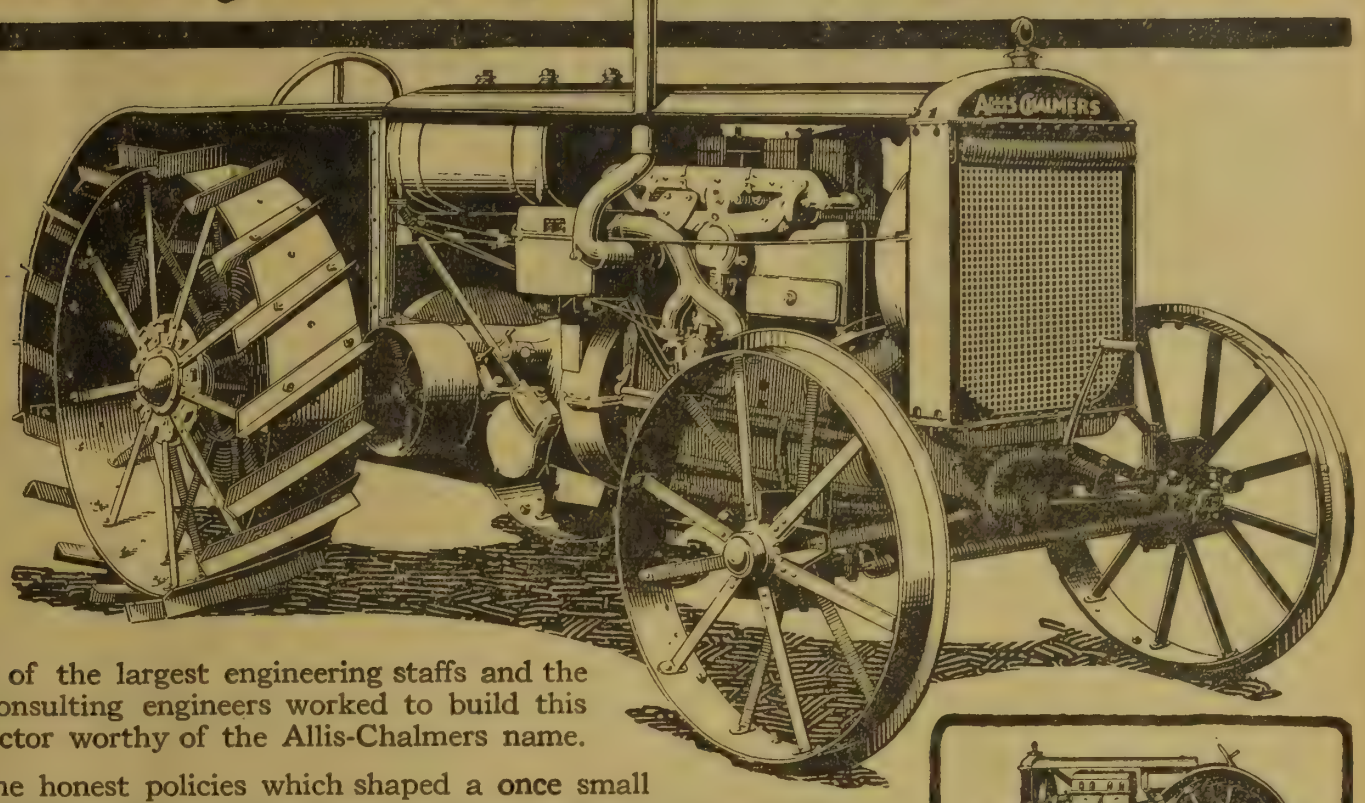
"Sir, I beg to sign myself
"Respectfully,
"JOHN DOE."

Mr. Shedden had a good laugh over the letter. "This poor penitent," he said, "I'm glad to see has the saving sense of humor, and a conscience which seems to work well—outside the glorious climatic influence of California, and although he assessed himself only half rates on the big 'alligators,' I'm satisfied to go fifty-fifty with him on them, because I enjoyed the incident, and should he ever get out from under 'John Doe,' and come up again to Florimel, I'll treat him well, in honor of his having started the 'conscience fund,' which I have now opened."

MANGOES IN CALIFORNIA

Mangoes will doubtless never be produced over much of California, that are good enough for a dessert fruit. But there are several other uses for which immature fruits or those of comparatively poor quality are practically as good. Excellent mango sauce, very similar to that from the apple, may be made from the full grown unripe mango. Other uses are for jelly, marmalade, preserves, pickles, candies, or chutney.

When a $42,500,000 Company Says "O.K."



Allis-Chalmers 18-30

3-4 Plow

3000 Lbs. Constant Drawbar Pull

FOR seven years one of the largest engineering staffs and the country's foremost consulting engineers worked to build this brute of steel—a tractor worthy of the Allis-Chalmers name.

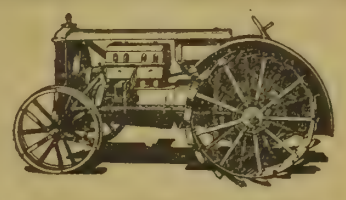
For seven years the same honest policies which shaped a once small manufacturing company into a $42,500,000 institution, have guided every step in Allis-Chalmers' solving of the farm power problem—policies which have been faithfully adhered to for 65 years.

For seven years the development of Allis-Chalmers tractors has been marked by a succession of tests—by trials of a score of models—and the expenditure of $3,000,000 that Allis-Chalmers tractors should prove capable of withstanding the punishments of service.

But that was not enough! It was the endorsement of the farmer that Allis-Chalmers wanted! That is why Allis-Chalmers first released only a limited number of 18-30's—why the judgment of owners was considered paramount—why the particular needs of every territory governed every unit of design.

Such is Allis-Chalmers thoroughness—an insistence that every product of the Allis-Chalmers plant serve its owners just a little more faithfully, economically and efficiently. So, today, the A-C 18-30 stands as the perfected tractor—serving in every section of the country, and against which not a single farmer has made complaint. And in support of this, we refer you to any A-C 18-30 owner for the facts about the service he is getting. So advanced is this tractor in design, so remarkable its field performance, that an A-C 12-20 is being built—*embodying the same time-tested features which have made the 18-30 famous.*

Now, climaxing seven years of tests and engineering effort, the $42,500,000 Allis-Chalmers Company says "O. K." Now Allis-Chalmers tractors are ready to set heretofore unattained standards in farm power efficiency—do the work tractors should do—but more economically, at less expense and for a longer time. And now Allis-Chalmers enters volume production with their 65-year reputation staked on this tractor.



Watch for the A-C 12-20!

Here is the coming 12-20 tractor. There is no guesswork about what it will do in the field—the A-C 12-20 embodies the same construction features as the A-C 18-30. It is a 2-3 plow tractor with 2000 pounds constant drawbar pull—with a power reserve to overcome all emergencies. Its speed range is 2½ to 3¼ M. P. H. Factory and field tests are completed, and this new tractor is now being made ready for production. The same Allis-Chalmers engineers who have designed and built the manufacturing machinery for some of the largest factories in the world are entrusted with the making of the A-C 12-20. Large scale production, combined with Allis-Chalmers' enormous buying power, will make this 12-20 one of the greatest tractor values in the country. Go to your dealer today and ask to see the 18-30, after which the 12-20 was modeled. A demonstration will convince you that Allis-Chalmers is the make of tractor you want.

Plow Deep—Grow Larger Crops

The difference between a shallow and a deep furrow is the difference between a seed bed which rapidly loses moisture and one which tends to conserve it. Plow deep—into subsoil—and make every inch of rainfall deliver the maximum amount of moisture necessary for healthy plants and early harvests. By all means get a tractor that will plow *deep—without strain!* It will quickly earn its slight increase in cost through vastly increased crop yields. Both the Allis-Chalmers 18-30 and 12-20 are built for deep plowing.

Power for the Hardest Jobs

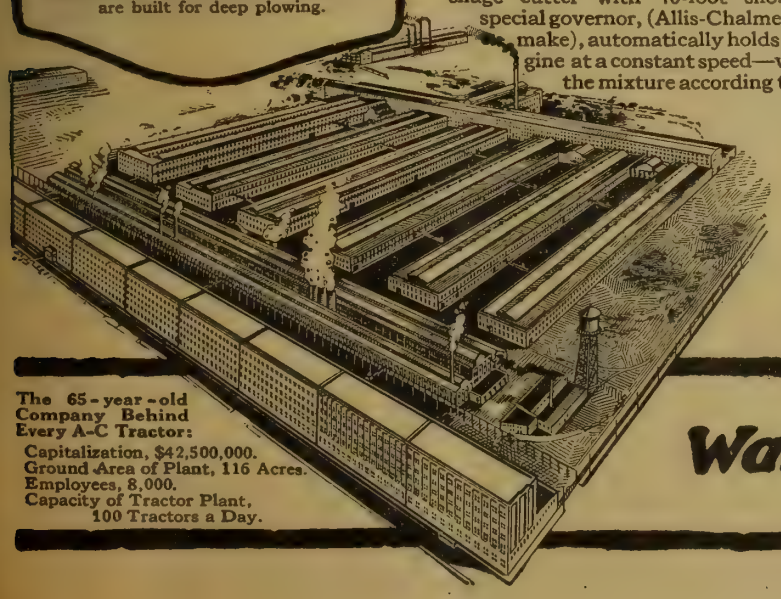
The 18-30 motor is conservatively rated, and possesses an abundant reserve. Under ordinary soil conditions it pulls four 14" bottoms—*without strain.* It operates a 28" separator, with all attachments, and handles the largest size ensilage cutter with 40-foot silo. The special governor, (Allis-Chalmers' own make), automatically holds the engine at a constant speed—varying the mixture according to load.

A Tractor with "Built-In" Long Life

Frameless construction and three-point suspension provide a flexibility that relieves all strains in roughest going, bearings are thoroughly lubricated by a pressure feed system perfected at a cost of $75,000; air entering the carburetor is first washed—freed of every particle of dirt and dust; an oversize fin-and-tube type radiator prevents overheating even in the warmest weather.

Quick Accessibility to Every Part

Every working part of the A-C 18-30 is open to almost immediate inspection. Clutch shoes can be taken out for re-lining in 15 minutes; cylinder heads are easily removable and expose all valves for grinding or cleaning of carbon; spokes on both guide and drive wheels are riveted both to the hub and rim, thus making it possible to replace individually any damaged spoke; crankcase interior can be reached through inspection plates.



The 65-year-old Company Behind Every A-C Tractor:

Capitalization, $42,500,000.
Ground Area of Plant, 116 Acres.
Employees, 8,000.
Capacity of Tractor Plant, 100 Tractors a Day.

WRITE FOR BOOKLET TODAY: Ask for 18-30 booklet giving exclusive features of Allis-Chalmers construction. Descriptive literature on the coming A-C 12-20—the smaller partner to the 18-30—will also tell you why your choice should be an Allis-Chalmers tractor.

DEALERS: The new addition to the Allis-Chalmers tractor plant provides a production capacity of 100 tractors a day. A mammoth sales co-operation program in keeping with this production is extended all A-C dealers. Write for details of attractive dealership and jobber proposition.

Dr. Whitten on Long Pruning

By Ernest Braunton

THE agricultural extension department of the state university, under the guidance of the Los Angeles County farm bureau, on January 3 gave pruning demonstrations at Pasadena and Pomona, Dr. J. C. Whitten, professor of pomology at the University of California, being both speaker and pruner.

The first work was on several trees on the A. T. Nichols place at Pasadena, there being about 215 persons present. Dr. Whitten is a most engaging lecturer, a peripatetic orator, who talks, walks and prunes with ease, all at one and the same time. So that as one reads what he said, the clip, clip of the pruning shears should be understood as a necessary accompaniment. "We long prune because we get far better results than under the old method. It consists of thinning rather than heading. Open the center to let in light so leaves will grow there as well as in other parts of the tree. For leaves alone manufacture plant food. Roots would be of no avail without leaves. The former absorb water containing a little mineral matter, in no wise a plant food. This crude sap goes out into the leaves and the green coloring matter there, in the presence of sunlight, elaborates it and converts it into plant food. Therefore get many leaves. The bulk of the tree, about 97 per cent, is built from the atmosphere by the leaves. But three per cent comes from the soil and when the wood is burned the 97 per cent returns to the air; the three per cent is left as ashes, being of the earth earthy. The lower, thick, dark colored leaves are the factory hands; the thin, papery light colored leaves on upright sucker growth are robbers, for they lose the tree much water during hot weather.

"If we head back heavily we induce a heavy crop of robber leaves that takes from everything below, from that which is really the best, most mature, most potent part of the tree. Long leaders left grow no higher than new growth would each year under the old stubbing back process, and after length growth is made stores until October a sap thick with sugar and starch. Then in spring, when the call comes, this sap is thinned out and feeds all subsequent growth with crude material for conversion into plant food. This storing for the following year begins in June. In actual practice crude sap or water freezes at 32 degrees, but if a spoonful of sugar is added to a quart of water, 20 degrees more of cold are required to freeze it. Go over the trees in May and pull off the rank growth of suckers that through its thin papery leaves is robbing the tree of needed moisture. Such foliage wastes 30 times as much water as the thicker, heavy leaves lower down on the tree.

"When the young tree is set out, whitewash it the same day to prevent sunburn or sunscald. For sunburn takes place in winter, not summer. At Berkeley, where warm winter days run up to 65 degrees, we find that the tree temperature under the purplish bark runs up to 100 degrees. Then during the night the temperature drops to freezing point or below, with a weakening effect on the tree. When the same trees were whitewashed the temperature remained three degrees below that of the air, or 62 degrees. In the latter case the tree remains wholly dormant until aroused by the warmth of spring. Compared with short pruned trees standing beside them and treated alike in all other ways, the long pruned trees made double the growth and yielded twice the crop in the second year. In long pruning the whole structure becomes more robust, vigorous, more stocky. Prune any time when the leaves are off. Whitewash with a material that totals ten parts or one pound of salt to two pounds of sulphur and seven pounds of lime. While the water is hot from the lime, stir in the sulphur and salt; it will then most quickly dissolve." Dr. Whitten quoted many statistics to prove the value of long pruning in crop yield, and Assistant Farm Adviser V. F. Blanchard told of one orchard where six rows were short pruned, six long pruned and six intermediate pruned, through a large orchard. The short pruned yielded six tons an acre, the intermediate eight tons and the long pruned 12 tons.

In the afternoon Dr. Whitten pruned several trees of several varieties in the orchard of Howard Hall, near Pomona, there being present about 275 persons. Much of this work was done on trees previously pruned by him in 1919, so that it differed much from that performed on young trees at Pasadena. While nearly all consisted of thinning, a few branches were taken out that last year were left because of the crop they would bear. Dr. Biller made a strong plea for an increased membership of the farm bureau, after which the crowd dispersed.

Black Purple Vetch in Humboldt

By J. M. Thomas

THE raising of black purple vetch, an industry that promises to be third in size of all Humboldt County industries within a few years, is attracting the attention of the local agriculturists just at present, and during the fall and early winter months there has been extraordinary activity in leasing lands suitable for its culture. Where there was in 1919-1920 374 acres planted to purple vetch, there will be in 1920-'21 approximately 2,200 acres in the same product, for the experiences of the planters of this past year have proven that vetch raising in this county is not only successful but profitable.

The purple vetch seed, as used for cover crops in the citrus orchards of the south, has been scarce during the past few years owing to the appearance of aphis in localities where it had been previously grown. Experimental plots were tried out in Humboldt County about four years ago by E. G. East, with such success as to warrant planting of more extensive crops, the first here being planted under Prof. McKee of the United States bureau of plant husbandry.

The rolling land in the valleys surrounding Humboldt Bay has been found most suitable for vetch culture. The seed was planted in November and December, with the exception of one field, which was sediment soil on overflow land, and this was not planted until January. Sixty per cent of this acreage had never before been planted to vetch, but the balance had formerly produced either some variety of vetch or peas. Only in two instances was superphosphate used, and not over 250 pounds to the acre was applied. The vetch land was plowed once and disked and harrowed twice, and in most cases the seed was broadcasted.

In various places from 13 to 60 pounds of seed was planted to the acre. The yield on those fields where less than 25 pounds had been planted was found to be light, but the seed was of excellent quality. An average of 50 pounds to the acre was decided upon as about right for a dependable crop.

Of the entire vetch planting only one field was cut once before being allowed to mature. This field of second growth showed a better condition of seed and cleaner and more mature grain than the others, and for the coming year the planters are being advised to allow the second growth. The vetch was cut early in August with a common mower and dumped into windrows.

The grain was allowed to lie in the fields for from ten days to two weeks before threshing. It was then hauled in wagons direct to the thresher and threshed in the field. In only a few

cases it was stacked and covered with a tarpaulin.

The unlooked for early rains retarded the threshing but apparently did no damage to the seed, at times making it lighter in color but of good quality. In order to insure its value some of this seed was germinated, with good results. Even in one instance where the vetch had grown very rank and had been rained on, the seed moulding in the bins, a germination test produced results 60 per cent successful.

The early rains caused considerable loss in several of the fields, the grain having to be turned several times while drying, and the otherwise tough pods, which had lost some of their resistance through being wet, opened and cracked. One estimate placed the loss as high as 35 per cent of the seed.

The gross average yield, as recorded at the thresher, was between 1,200 and 1,500 pounds of seed per acre. The average yield after being cleaned was approximately 850 pounds through the entire crop. From the 374 acres planted there was 307,217 pounds of seed cleaned, and this tested 90 per cent or better, pure.

The total value of the crop in the county was about $60,000, averaging the planters $125 per acre. Besides this revenue the planter has the benefit of the improvement to his land and the straw which has a value both as feed and as a fertilizer.

None of the Humboldt crop was touched by aphis. This fact is thought to be due to the fall planting which gave a vigorous growth and good root system and carried the plants through the dry season before maturity.

There are 80 growers on the list for the coming year, and they have planned to plant some 2,200 acres. The estimated value of the 1921 crop is between $300,000 and $400,000. The growers are firmly organized as a department of the Humboldt County farm bureau and closely allied with the marketing and exchange department. They are working under 15 cent contracts for the coming two years, which were arranged through the farm bureau and the farm adviser, and at present control practically 90 per cent of the purple vetch seed in the United States. They hope to interest all of the growrs on the Pacific Coast in this organization, and when the present guaranteed market has spent itself, will further market their products through the farm bureau systems. The present arrangement and guarantee allows the growers to experiment at a profit and provides the citrus growers with their green manure crop at a reasonable figure.

Nutritional Worth of Ripe Olives

By M. E. Jaffa

IT IS extremely gratifying to be able to state that canned ripe or mature olives may be placed on the market with absolute safety to the consumer. The mature olive is also protected as to the oil content by the ruling of the United States department of agriculture, bureau of chemistry, which has rendered an opinion in effect that as a tentative standard of maturity for Mission olives and other common varieties except the Manzanillo, Ascolano, Sevillano, an oil content of 17 per cent in the flesh is regarded as a minimum. This will protect the honest packer and safeguard the food value to the consumer.

The great difference between the mature and immature Mission olive will be appreciated by the examination of the table given herewith:

	Water	Protein	Fat	Carbo-hydrate	Ash	Fuel value per lb.
	Pct.	Pct.	Pct.	Pct.	Pct.	Pct.
Olive, ripe or mature	69.60	2.00	21.00	4.00	3.40	958
Olive, immature	78.41	2.43	12.90	1.78	4.48	598
Pickles	93.80	1.10	.40	4.00	.70	110
Bread	35.30	9.20	1.30	53.10	1.10	1215
Meat, round steak	67.80	20.50	10.60	.....	1.10	835
Rice, raw	12.30	8.00	.30	79.00	.40	1630
Rice, boiled	72.50	2.80	.10	24.40	.20	525
Potato, edible portion, raw	78.30	2.20	.10	18.40	1.00	385
Boiled	75.50	2.50	.10	20.90	1.00	440

Comparing the ripe and green olive, it will be noticed that the percentage of fat or oil in the latter is only about 60 per cent of that yielded by the former. This would appear to be, according to the chemical analysis, the main difference between the green and ripe fruit, which difference is further confirmed by the figures indicating the fuel value of calories per pound.

In this connection it should be stated that the figure for oil in the ripe olive is that which the ripe fruit should yield. Unfortunately, however, there are on the market a large number of olives labeled "ripe olives" which contain far too low a percentage of oil.

More Nutriment in Ripe Olive

Furthermore it may be said that the difference in oil does not indicate the whole difference between the two forms of fruit because undoubtedly the nutriment in the ripe fruit is in a much more digestible form than in the green. The green fruit, the common variety, is unripe and therefore to a certain extent immature. It is readily seen that it is to the interest of the consumer to buy the ripe olive rather than the green in, that he receives for his purchase far more nutriment in one case than in the other.

This, however, is not the only interesting point brought out by a study of the table. Bread is generally considered to contain, weight for weight, far more nutriment than is found in the olive, yet as far as the total food value, expressed in calories, is concerned, it will be noted that in one pound of ripe olives there is practically three-fourths of the caloric value noted for bread.

Raw Rice vs. Ripe Olives

Again, if we compare the ripe olive with raw rice, the rice will rank far ahead in total food value; that is, in one pound of raw rice we have much more nutriment than in one pound of olives. If, however, we compare the rice as eaten with the ripe olive which is ready for consumption, it will be noticed that in one pound of ripe olives there is practically twice as much nutriment, if we take the calories as a basis for comparison, in the olive as in the rice. This is a point quite often lost sight of when comparing food values.

For instance, in a pound of dry macaroni there is far more nutriment than in a pound of ripe olives. Again if we compare both foods in an edible condition, the case is different and the comparison is in favor of the olives in that in a pound of cooked macaroni we have about 400 calories while in a pound of olives, edible condition, we have between 900 and 1,000 calories. It is therefore seen that the ripe olive, as far as food value is concerned, compares very favorably with many of the ordinary foods.

Ripe Olive Not a Condiment

It is not always correct, however, to compare food values on the basis of calories alone because the real value of the food to the body depends on the intended purpose more than on the calories. For example, one pound of sugar contains 1,820 calories, one pound of meat less than 1,000, yet one would hardly say that one pound of sugar is equal to a pound of meat when the question of growth is concerned, and similarly with reference to olives. One pound of olives with 1,000 calories, if we are considering

Bringing in the New Help

ELECTRICITY hooked up to G-E motors will do many things to make farm life more pleasant and profitable.

To provide water for all uses—as handy helpers at the silo, wood pile or cider press—to clean up tasks in the dairy, barn, workshop and field—G-E motors are time, labor and money savers.

In the farm home G-E motors take the deadly grind out of wash day—put an end to endless sweeping and in many other ways add to happiness and comfort. If you are near a power line—you need G-E motors.

The Miskin Tractor Scraper

This Is IT At Last

THE MISKIN TRACTOR SCRAPER
GUARANTEED TO MOVE TWICE AS MUCH DIRT AS ANY OTHER SCRAPER ON THE MARKET, WITH THE SAME HORSE POWER IN THE SAME LENGTH OF TIME.

The tractor carries the front, the scraper wheels carry the balance of the scraper, loaded or empty.

Easy to fill with the lever at the side of tractor driver's seat and easy to dump and spread with the rope. No stopping, nor backing up.

Made in four sizes, from one-half to one and one-fourth yard capacity. Most small tractors handle the yard size easily.

Sold with the same GUARANTEE of satisfaction or money refunded, that we have always given with our horse drawn scrapers for which we claim 100 per cent satisfaction.

Prices, terms and capacities the same as that of the horse-drawn scraper of the same size.

Ask about our horse-drawn scrapers if interested.

Write for circulars with prices, and names and locations of dealers.

We Pay the Freight

growth and replacement of wornout nitrogenous tissues, would not be worth to the body as much as a pound of meat with 1,000 calories, but as a source of muscular energy the olives would be a most excellent supplement to foods such as meat or fish and cereals.

Summarizing in brief, then, it may be said that the ripe or mature olive is a very valuable, palatable and easily digestible form of food and should be considered as such and not as an accessory or condiment.

MANUAL OF TROPICAL FRUITS

Wilson Popenoe, to whom avocado fanciers look for what is latest and best in that fruit, has at last put into book form the results of his travels, experiences, studies and observations as agricultural explorer for the United States bureau of plant industry. Even now, as the book issues from the press, the author is in Costa Rica, rambling amidst avocado and other tropical fruits in their native wilds. The work is a large one, containing 475 pages, 24 full page plates and many line drawings, fully covering a list of nearly 100 of the leading fruits. The "Manual of Tropical and Subtropical Fruits," published by The Macmillan Company, New York, should be in the hands of all interested in the world's array of tropical luxuriance in fruits.

Make Income Tax Returns Before March 15

THE war tax gatherer is still with us. There is no relief whatever. The secretary of the treasury has said that there will be required at least four billions to run the country, and while it is possible that congress may relieve us from the soda water tax a little later, four per cent on all of our income, not exempt, must be paid at least this year. Even with last year's disastrous returns to some farmers there will be many whose incomes exceed the $1,000 or $2,000 exempt, and so long as the returns must be made it is well to have the information at hand. Regulations will remain much the same as last year, but for those who may wish to refresh their memories as to the requirements, here is from the latest circular issued by the bureau of internal revenue:

To thousands of farmers who this year are required to file an income tax return and pay a tax on their net income for the year 1920, the problem of correctly making out the forms is less intricate than in former years. The income tax law with respect to the filing of returns is unchanged. Every single person—the term including widows, widowers and persons not living with wife or husband—whose net income for the year 1920 was $1,000 or more, and every married person living with husband or wife whose net income was $2,000 or more, must file a return with the collector of internal revenue for the district in which they live. If the aggregate net income of husband and wife equaled or exceeded $2,000 and was less than $5,000, each may make a separate return or the income of each may be included in a single joint return. In the case of husband and wife whose combined net income exceeded $5,000, separate returns should be made showing the respective amount of income. This is for the purpose of computing correctly the surtax, which applies only to incomes in excess of $5,000. The period for filing is from January 1 to March 15, 1921.

In the return of married persons must be included the income of dependent minor children. If, for example, the husband's net income was $1,000, that of his wife $500 and that of two minor sons, whose earnings are appropriated by the parents, $400 each, a return must be made of the total family income of $3,100.

The exemptions and credits also are the same as those for 1919, $1,000 for single persons, $2,000 for married persons and heads of families and $200 for each person dependent upon the taxpayer if under 18 years of age or incapable of self-support because mentally or physically defective. In the above example, if both sons are under 18 years of age, the taxpayer would be entitled to a total exemption of $2,400.

The tax rate is unchanged. The normal tax is four per cent on the first $4,000 of net income in excess of the exemptions and eight per cent on the remaining net income. The surtax rates range from one per cent on income between $5,000 and $6,000 to 65 per cent on income in excess of $1,000,000.

As an aid to farmers, the bureau of internal revenue has had prepared a special form—1040F— for recording sales of livestock, produce and miscellaneous receipts. All farm income from any source whatever must be reported in this schedule.

Treasury regulations provide that in his return of gross income a farmer shall include "all gains, profits and income derived from the sale or exchange of farm products, whether produced on the farm or purchased or resold." When he exchanges his products for groceries, clothing or merchandise, he must include in his gross income the value of the articles received in exchange. A farmer who rents his farm or part of his farm on a crop share basis must report as income the profit from such transaction. Profit from the sale of farm land or livestock must be included. If the land sold was purchased prior to March 1, 1913—the date the first income tax law became effective—the amount to be reported as income is the difference between the fair market value of the land as at that date and the amount received.

Net income, upon which the tax is assessed, is gross income less certain specified deductions. All necessary expenses incurred during the year 1920 in the operation of a farm are deductible items. These include the cost of cultivation, harvesting and marketing of crops, and the cost of seed and fertilizer used. Amounts expended for the cost of feed for livestock may be claimed, but the value of a farmer's own products used for such purpose is not a deductible item. The cost of farm tools used up in the course of the year, wages paid to employes (other than domestic servants), and rent paid for farm lands and buildings (other than the dwelling), cost of repairs to fences, wagons and machinery are deductible items, also bills paid for horseshoeing, stock powders, rock salt, veterinary service, insurance (except on dwelling), gasoline for operating power, and sundry minor expenses.

Cost of purchase of farm machinery of permanent character, such as a threshing machine, and extensive repairs to farm buildings, such as placing a new roof on the barn, are not deductible expenses, but are regarded as capital investments.

The automobile and motor truck now form part of farm equipment. The cost of such vehicles is not an allowable deduction, but cost of operation may be claimed if they are used exclusively for farm purposes and not for pleasure or convenience. Also, in such cases, claim may be made for a reasonable deduction for depreciation of such vehicles.

Losses incurred in the operation of a farm as a business enterprise are deductible from gross income. If, however, farm products are held for a favorable market no deduction on account of shrinkage in weight or physical value by reason of deterioration in storage is allowed. Loss by frost, storm, flood or fire of a prospective crop, or of a crop which has not been sold, is not deductible. The reason for this rule is that unless the crop reaches maturity and is harvested and sold, its value is never included in gross income, and the farmer has so much less income to report. The same is true with regard to the loss of animals raised on the farm. However, if livestock has been purchased and afterwards dies, or is killed by order of federal or state authorities, the actual purchase price, less any depreciation previously claimed, and less any insurance and indemnity recovered, may be claimed. In determining the cost of stock for the purpose of ascertaining the deductible loss there shall be taken into account only the

purchase price and not any cost of feed, pasturage or care which has been deducted by the farmer as a cost of farm operation.

General deductions such as for taxes, interest on personal indebtedness, losses sustained in transactions entered into for profit aside from the farmer's regular business, losses sustained by fire, storm or other casualty, bad debts and contributions are explained in instructions on the forms for filing returns.

The term "farm," as defined by treasury regulations, includes stock farms, dairy farms, poultry, fruit and truck farms, also ranches, plantations and "all land used for farming operations." It should be noted that a business man who operates a farm for recreation or pleasure and not for profit may not, if the farm expenses exceed the receipts, deduct such loss in his individual return of income. In such an instance the cost of farm operation is regarded as a "personal" expense, and therefore is not deductible.

A farmer who keeps his account on the "receipts and disbursements" basis—which means a record of the amount received and the amount paid for expenses—should file his income tax return for the year 1920 on that basis. Another method is the keeping of books of income and expenses on the "accrual" basis, which is required of all persons whose accounts are kept on such basis.

For those keeping their accounts on the accrual basis, inventories are necessary at the beginning and end of each taxable year. The gross profits are obtained by adding to the inventory value of livestock and farm products on hand at the end of the year, amounts received from the sale of stock and products and other miscellaneous receipts during the year, and deducting from this sum the inventory value of stock and produce on hand at the beginning of the year, plus the cost of stock and produce purchased during the year.

Farmers may change the basis of their returns for the year 1920 from that of receipts and disbursements to that of an inventory basis. There should be included in the opening inventory all farm products, including livestock, purchased or raised, which were on hand at the date of the inventory, and there must be submitted with the return for the year 1920 an adjustment sheet for 1917, 1918 and 1919 based on the inventory method. Upon the amount of these adjustments the tax will be assessed and paid (if any is due) at the rate in effect for each respective year.

Where it is impossible to render complete inventories from the beginning of the taxable year 1917, the bureau of internal revenue will accept estimates which substantially reflect the income on the inventory basis for each year. The inventories must not include real estate, buildings, permanent mprovements or other assets subject to depreciation.

Farmers whose net income for 1920 was $5,000 or less, should make their individual return on Form 1040A. Those whose net income was in excess of $5,000 should use Form 1040. To the form used should be attached Form 1040F, the special form for the use of farmers. Full instructions for making out the forms are contained in each.

The tax may be paid in full at the time of filing the return, on or before March 15, 1921, or in four equal installments, due on or before March 15, June 15, September 15 and December 15. Heavy penalties are provided by the revenue act for failure or willful refusal to file a return and pay the tax within the time prescribed.

COMING EVENTS

Sixth National Tractor Show, Columbus, Ohio, February 7-12. Manager, E. E. Whaley.
Eleventh National Orange Show, San Bernardino, February 18-22. General Manager, F. M. Renfro.
American Honey Producers League, Indianapolis, Indiana, February 15-17.

SUMMARY OF CROP PRODUCTION FOR 1920

(Continued from Cover Page.)

Large Whites, 30,000; Pinks, 150,000; Blackeyes, 180,000; Red Kidneys, 36,000; Cranberries, 21,000; Mexican Reds, 36,000; Bayos, 12,000; all others, 15,000, or a total of 1,710,000 bags. It is to be noted that Teparies which in 1918 reported 250,000 bags were during the past year only chronicled with miscellaneous.

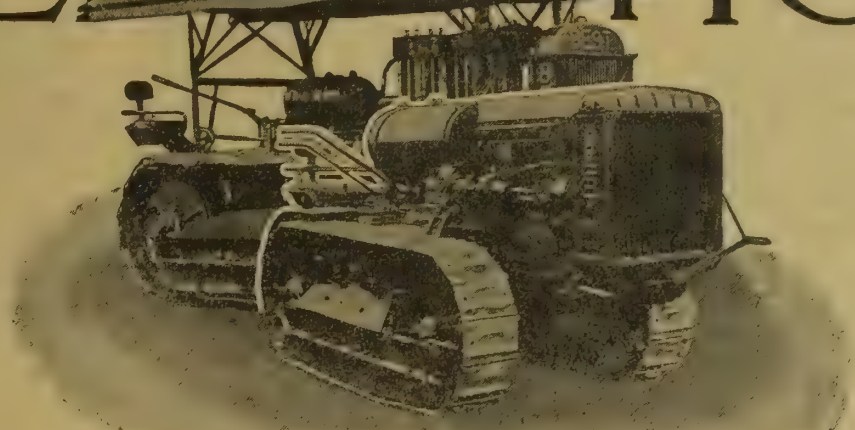
In fruits the citrus is a leader, but if divided into oranges, lemons, grapefruit, etc., then raisins take first place. The total farm value of raisins in 1920 was $55,800,000. This was an increase of about $17,000,000 over the preceding year. Oranges also showed an increase, having a farm value in 1920 of $51,425,000. As may be seen from the table, nearly every other fruit crop suffered a decline, though tonnage was materially greater in 1920 than in 1919. The olive crop is not given in the table because harvest is even yet not finished and very heavy losses were suffered.

AVOCADO DIRECTOR RESIGNS

By reason of ill health, J. M. Elliott, a director of the California Avocado Association, has resigned. William Hertrich of San Marino was appointed to fill the vacancy. Mr. Elliott's offer was accepted to continue his duties as treasurer and to help to the extent of his ability in attending meetings and giving the benefit of his advice and experience. While accepting his resignation, President Sallmon expressed the profound sorrow of all the members of the board of directors that Mr. Elliott found it necessary to sever his official connection and also expressed their appreciation of the valuable service he has rendered as a member of the board and their pleasure in the thought that he will still meet with them at their business sessions. The greater part of an all day session on January 6 was devoted to the discussion of marketing. Several committees were appointed to look further into the possibilities offered by varous suggestions made by members of the board and others, and another meeting will further consider this problem in the near future.

The new nut shelling plant of the Almond Growers Association at Sacramento is practically complete.

REPUTATION



The Best Tracklayer Sixty Tractor has built a reputation for stamina, reliable power and low up-keep. This reputation so closely guarded by the manufacturer has been due to the quality of material used, the proven design and the knowledge of tractor requirements which has been gained through years of experience in the actual building of tractors and the incorporating of modern improvements in each new model.

The "Sixty" was too powerful for all uses; so, upon the demand of farmer, orchardist, contractor, in fact all lines of industry where tractors are employed, the factory has perfected a model to be known as the Best Tracklayer Thirty Tractor, in which has been incorporated all of the experience of the manufacturer as to design, etc., together with all of the reliable improvements of the age. The "Thirty" is years ahead of any other tractor on the market.

Delivery date on this new model "Thirty" About February 1st, 1921. Send for circular.

Soy Beans

By G. W. Hendry

Soy beans have been grown experimentally at the university farm at Davis for several years, during which time numerous varieties have been tested. As a general thing we have found that Soy beans do not thrive so well in the interior valleys of California as they do in the central and south Atlantic states and the success they have had in those regions has led many to think that it would be equally well adapted to California.

Experiments at the university farm have demonstrated, however, that certain varieties of cow peas, such as the Whippoorwill and Clay, are much superior to them in this region from the standpoint of forage production, and certain drouth resistant types of beans such as the Blackeye and Tepary will exceed them greatly from the standpoint of seed production. For example, at the university farm on good land, with good cultural practices and an abundance of irrigation, the best varieties of Soy beans have yielded from 500 to 600 pounds of seed per acre, whereas Blackeye beans under similar conditions have yielded from 1,500 to 2,000 pounds per acre. As a forage crop the Whippoorwill and Clay cow pea varieties under irrigation at the university farm have produced from 10 to 12 tons of green forage per acre, whereas the largest types of Soy beans under similar conditions have produced only from five to eight tons of green forage per acre, and this of inferior quality. Certain of the sweet or forage sorghums, such as Honey sorghum, Red Amber and Orange grown under similar conditions have yielded from 18 to 25 tons of forage per acre. Soy beans have made a much more favorable impression in the cooler and more humid coast districts of central California, especially in the Small White bean territories skirting the coast from San Francisco to Santa Barbara, but in these localities Small White and Blue Pod beans are equally or more productive than Soy beans and have a higher market value.

Soy beans may be satisfactorily grown in the cooler mountain valleys at high elevation in California where climatic conditions resemble those found in our Eastern states, but when grown in the dry hot summer climate of the interior valleys they cannot compete with cow peas or sorghums for either grain or forage production.

THE CHOICE OF BARLEY VARIETIES

By G. W. Hendry

The choice of barley varieties should be determined largely by the type of soil upon which one expects to plant and also the season of year at which planting is to be done. Mariout barley is at its best in the warm interior regions of California and has shown the greatest advantage over common barley on soils of light texture, especially in the dry seasons and when planting has been practiced after the first of January. To secure the best results with Mariout barley, however, it should be planted early in the season. On heavy soil types, especially those which are inclined to be cold and poorly drained during the winter months, Mariout barley has not made a good showing and would be inferior to Beldi or common barley. Our first choice upon such lands would be Tennessee Winter, providing planting could be done prior to the first of the year.

Beldi barley was formerly grown extensively at the university farm and given a wide distribution several years ago throughout the state.

We have now developed a new variety, however, called Four Thousand, which has outyielded Beldi by about ten per cent consistently over a period of years at the experiment station. Four Thousand is a prolific and a better variety than either common or Beldi and will outyield both by about ten per cent on any soil types in any part of the state and under any conditions of culture. It is identical with common barley in appearance and is merely a pedigreed high producing strain of common barley. We would recommend it under all conditions as superior to common barley but would give Mariout the preference for heavy cold, wet soils for early fall plantings in the regions of higher rainfall.

CERTIFIED SEED POTATOES

Californians planted approximately 100,000 acres of potatoes in 1920. The harvest yielded from nearly 300 sacks to the acre in a few small fields to practically none in many large fields. Nearly all the failures were due to conditions beyond control of the grower — unfavorable weather. The largest unharvested fields visited were examples of late planting, earlier planting of the same variety in adjoining fields bringing good results. In a few fields extremely early planting met with disaster. There was a favorable time during last spring, designated as early (about the first half of March) when resultant crops were uniformly good throughout the state. Many failures were due to poor seed.

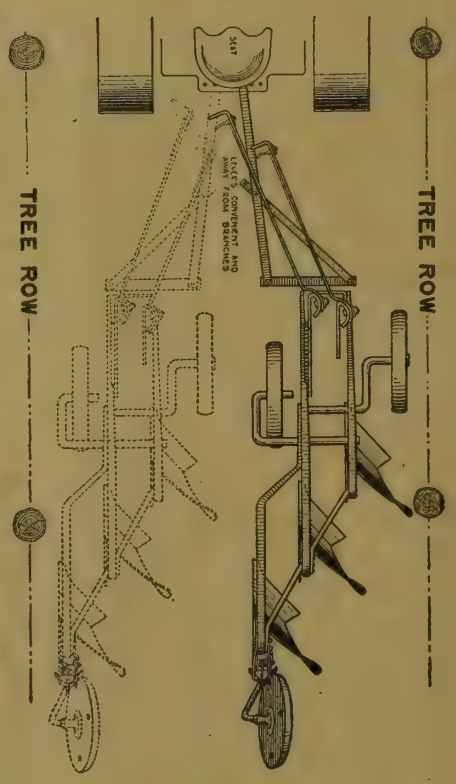
While we cannot control the weather we may have complete and satisfactory control over the seed supply. The state department of agriculture can guarantee good seed insofar as it is possible for human agencies to control. It should be remembered that "seed" potatoes are cuttings, as much so as rose cuttings (some are "Rose" cuttings). They are the matured material of the past season's growth, cut into pieces, each containing several buds or eyes, whether "White Rose" potatoes or "Cherokee" rose bushes. It is quite evident then that selection is of first importance. A close study should be made as to vigor, productivity and freedom from disease. Both kinds of "roses" are subject to insect pests incident to all crops and both are subject to plant diseases. In potatoes the latter are: Curly leaf, leaf roll, mosaic, and spindle-sprout. Added to these is the unexplainable "running out" of varieties. The state department of agriculture will inspect the seed and growing crops three times during the season and if the results warrant will attach a "certified" tag to each sack. Such seed is always a good and safe investment for the intending planter. The department is ever willing and anxious to cooperate with all growers to this end. If in doubt on any point write the state department of agriculture at Sacramento.—E. B.

CHARRING DOES NOT STOP DECAY

The theory that charring the butts of fence posts and telephone poles preserves the wood has been disproved by a series of tests recently conducted by the forest products laboratory of the forest service, United States department of agriculture, on fences with charred and untreated posts of varied species. The charred posts proved to be even less durable than the untreated ones.

Theoretically, an area of charred wood around a post should prevent decay, because charcoal does not decay or encourage the growth of fungi.

A Real Orchard Plow for Small Tractors



A light draft, easily-handled plow that can be worked close to the row without injuring the trees—that's what every fruit grower wants.

The John Deere No. 8 is the tractor plow that meets those requirements.

Reversible Hitch permits setting the plow to either side for close work in throwing either to or from the row. Note the illustration at the right.

Levers can be angled in when the plow is set to either side — they are always within easy reach from the tractor, out of the way of branches and free of the tractor wheels, when turning short.

Levers set low when the plow is at work.

Doesn't Scar Trees — Note the wheel base design that permits close work without scarring trees — land wheel set inside line of third beam; furrow wheel set inside line of inner mold-board wing.

Simple, Positive Power Lift; great range of adjustment for deep or shallow plowing; unusual clearance; bottoms that insure good scouring and pulverizing, and strength throughout to stand the strains.

Just the size for small tractors—three ten-inch bottoms—pulls light. Can be reduced to two bottoms by removing one beam, bottom and brace, and using a short connecting rod furnished as an extra.

For orchard or field plowing, you will find the No. 8 just what you want. Write today for free folder describing it.

Bartlett Pear on Japan Roots

We still have some fine Bartlett as well as Bosc, Anjou, Comice, Flemish Beauty, Winter Nellis and other leading varieties of pears on Japan Pear roots.

These trees are grown on new soil never before in nursery stock, are well rooted, clean, healthy and hardy.

Hundreds of thousands of our trees in all parts of the West are now bearing profitable crops for their discerning owners.

We also carry a complete line of general nursery stock, all of which is guaranteed to please you.

Remember our prices cover freight and packing charges.

But the charred area around a post is not usually a solid covering. It is checked through in many places. If posts are seasoned before they are charred, the charring does not reach to the bottom of the season checks which are always present. If green unchecked posts are charred, checks will open through the charred part as the wood seasons. In either case the uncharred center of the post is exposed to fungus infection and will decay as rapidly as untreated wood.

Charring deep enough to resist decay would undoubtedly weaken a post of ordinary size.

THE JACK BEAN AGAIN

At frequent intervals in recent years promoters have resorted to extravagant advertising of the merits of the Jack bean. One of the latest efforts in this direction that has come to the notice of the U. S. department of agriculture is unusually extreme in its praise of this crop: "Mr. Farmer, $8 invested in American coffee beans and planted on one acre will bring you in four months $400."

The American coffee bean is our old friend, the jack bean, says the department. Ever so often it is exploited as a wonderful new crop. Long ago it was advertised as "Pearson bean" and "Wonder bean." In 1913 one advertiser called it Wataka, or Giant Pod Stock bean, claiming it would yield 400 bushels per acre. Last spring it came out as the South American coffee bean, with the information that it would yield 300 to 600 bushels per acre. Last fall it appeared as the American coffee bean, and the seed was offered at $25 a bushel. The extravagance of this price is offset by the promise that each acre of the bean will yield in four months time a crop worth $400.

The jack bean is at most a crop of very small value. It will yield a fairly large crop of green herbage, but this is so extremely bitter that it is very difficult to get animals to eat it, either green or as hay. Possibly it may be better as silage. The seed crop varies from 20 to 35 bushels per acre. The beans are not relished by animals and cattle do not make much gain when forced to eat it, as determined by the work of the Mississippi agricultural experiment station. The bean is to a slight extent used as food by Mexicans and others, but the flavor is very strong and in some cases serious digestive disturbances have been reported. The seeds contain much urease, a substance used in medicine, but a few tons of jack beans supply the world's annual demand for this substance.

Kentucky once led in hemp production, but has turned to more profitable crops and relinquished the lead to Wisconsin, according to the United States department of agriculture. The Badger state cultivated 7,000 acres, half the country's total, this year, followed by Minnesota, Michigan, Ohio and California, with Kentucky sixth.

The Cultivator Pulls

Petaluma, December 24, 1920:

If you do not want anything generally known, don't publish it in the Culitvator.

Some weeks ago I sent you a few lines about some corn that I had grown. The seed was obtained through an advertisement in the Cultivator.

The article you published about the result was not written with any expectation of selling seed, but as an appreciation of benefits received from being a reader of your publication.

Imagine my surprise in a few days after publication receiving letters from all over California, asking for seed or the address of parties having the same for sale. I have no seed for sale; am selling the crop to my herd of Jerseys. I have referred all inquiries to the originator of the corn and if he does not send you an advertisement he is not hep to the opportunity. Yours.—A. P. M.

The Days Between

SPRING work is always rush work. Planting seasons roll around with unalterable certainty, but no matter how few the days between plowing and planting, you can have a good seed-bed by using time-saving, labor-saving, and money-making machines. Do it all in the time you have by using

A Free Chemical Analysis of

Black Alkali Soil

If your crop production is poor because of black alkali send us a sample of your soil for free analysis.

Very likely we can prescribe an absolute cure for this condition in AGRI Gypsum which is a specific for black alkali.

In practically all cases of this kind AGRI Gypsum completely transforms unproductive land into fertile, productive soil, changing the deadly sodium carbonate into harmless calcium carbonate or the less harmful sodium sulphate, and incidentally adding sulphur, releasing potash and increasing nitrogen.

Send in your sample today for analysis.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Scale Breeding

My home is a lot 50 by 150. I have a good house and garden and 13 kinds of fruit. Am nearly 80 years old and blind. Owners of next lot have two peach trees and a pepper tree which are scale breeding, each one foot from our line. To get to my garage I cut the limbs on line straight up into heaven. The pepper scale breeder is sending its pestiferous stuff on all my trees and vegetables. I had to build a platform and my aged wife took a long handled pruning knife and cut a passage into our garage. The owner of the pestiferous pepper tree stood by her and cursed. The scale still sticks. The horticultural commission gave advice to cut up into space. The other half goes on growing scale. Why should thrift be hindered by false esthetics?—Syam.

Our subscriber was entirely within his rights in trimming the tree. In addition the horticultural commission should give relief by ordering that the tree be sprayed.

Leaf Cutter

In January 8 issue I notice your reply to "Subscriber, Lincoln," and it reminds me of the fact that there may be another cause for leaf cutting of rose leaves than the efforts of the Fuller's rose beetle. Without seeing the leaves in question, of course, it would be presumptuous of me to "butt in," and what I say must not be taken as a contradiction of your illuminating reply, but the description of the injury to the leaves as "so nice and round" reminds me of the leaf cutting bee, which is especially fond of tender rose leaves. This big black bee bores a tunnel as thick as a large lead pencil in fence posts and old tree stumps, and lines them with the disks cut from leaves as slick and clean as if done with a pair of scissors. Perhaps they are for the young grubs to eat. The only remedy I know of is to locate the holes and fill them at night with asphaltum. When I first noticed the work of this pest in my own garden I wrote to several of the best horticultural authorities in the state, and they united in ascribing the trouble to Fuller's beetle, but for once they were wrong, and I was able to prove it. Hoping you will excuse my seeming interference, yours cordially, O. T. Bryant, Fillmore.

Cottonseed to Mules

An inquirer recently asked as to feeding cottonseed to horses or mules. He referred to the danger of feeding to hogs and advised to be sure of its desirability for other stock. The question was referred to Prof. F. W. Woll and he answers:

Cottonseed meal is sometimes fed to both horses and mules, and with satisfactory results when it makes up not more than 10 or 15 per cent of the grain ration as a maximum. It is not especially palatable to these animals, and in order to get them to eat it the meal must be given in small amounts at first, not over one-fourth pound at each feeding, mixed with light concentrates such as oats, rolled barley, crushed corn or milo, etc., and the amount fed may be gradually increased until full feed is reached in a couple of weeks. Cottonseed meal is sometimes sprinkled on silage or on hay, cornstalks or similar feeds, which are previously moistened, but the best method of feeding it to work animals is ordinarily to mix it with the regular grain ration. Fed as suggested, cottonseed meal will tend to keep horses in good condition and appetite and give them smooth coats. Care must be taken to feed only fresh, bright cottonseed meal to horses or mules, as these animals are very sensitive to any kind of moldy feed.

Non-Bearing Peach

We have two Crawford peach trees which, while they grow luxuriantly, do not bear more than six or a dozen peaches. The trees are about ten years old and are very thrifty, but have never borne a crop.—Subscriber, Lodi.

Without knowing more of the situation we can only suggest a study of the local conditions. Has there been severe winter pruning each year? If so, this may have induced excessive wood growth at the expense of fruit. Again, it is barely possible that weather conditions at blooming time were unfavorable. Try long pruning for a few years and observe results.

Pear Blight.

Our young Bartlett pear trees seem to be affected by blight. Can you suggest something for them?—Subscriber, Lodi.

The only relief from pear blight is through cutting out. The past fall, because of early rains and warm weather following, has caused much blighting of even mature wood. The orchard should be carefully inspected and every blighted twig or branch cut out and burned so as to permit as little distribution of the pest as possible. Then in the early spring when the new growth is at its strongest development, constant inspection and cutting will be necessary. There is no possible help from sprays.

Leasing to Japanese

One reader told me last week that a neighbor of theirs had told him he could not rent out land to Japs any more. They wish to know through the columns of the Cultivator.—

The whole matter of Japanese leasing or owning land in California is at present so unsettled that it is perhaps wise to wait decision of Washington as to the present treaty under consideration, and also the ending of the state legislature, for there are several measures introduced or liable to be introduced which will affect this matter. As to effect of the recently passed initiative law, see Mr. Stanton's answer to a similar question on Page 47 of the Cultivator of January 8.

Avocado "Pear"

I am writing you for information about the avocado pear. Is this locality favorable for it? What is the Avocado Association's office address? We have 30 acres to set in fruit this winter.—Subscriber, McFarland.

Why the word "pear" has become attached to avocado is not understandable, and avocado growers have endeavored to have the term "alligator pear" discontinued, and this has been practically accomplished in the markets. The avocado is a semi-tropical evergreen tree, no more closely related to the pear than to the strawberry. Some of the varieties are very hardy; others will not bear as much frost as will the lemon, but by very hardy we do not mean that the tree will stand any considerable degree of frost. It has grown and borne most successfully in a few protected sections south of Tehachapi and in the citrus section of the Kern and Tulare County foothills has been quite extensively planted. The address of the California Avocado Association is Altadena.

Planting Apricots and Peaches

I would like to plant 20 acres to orchard, apricots and peaches. Would you kindly tell me how to proceed regarding seed, kind of seed, when to plant, when and how to bud, giving all the steps from now to the orchard?—Subscriber, San Jacinto.

Our subscriber has given us a rather good sized contract, in fact, one which would call for the writing of at least two books, but we may, perhaps, make some suggestions which will lead toward the information desired. In the matter of planting the seed and growing the nursery stock, "The Nursery Book," written by Bailey and published by The Macmillans, New York, affords most concise information. When published some years ago it was a $1.50 book, but if now reprinted perhaps more. Then, as to peaches, there is "The American Peach Orchard," by Waugh, published by Orange Judd Co.,

Chicago, and "Peach Growing," by Gould, published by Macmillan. Both of these are from an Eastern standpoint, but have lessons for the California grower. As to apricot production, we know of no book devoted to that subject. The department of agriculture at Washington, D. C., has published several bulletins or separates on peach diseases and methods of handling, as has the agricultural experiment station, University of California, Berkeley.

Grubs or Warbles

Could you tell me what causes grubs on the backs of cows at this time of the year?—Subscriber, Orland.

This is one of the pests that affects the value of hides and the comfort and profitableness of stock in California, as it does in all other sections. "Diseases of Cattle," published by the department of agriculture recommends: "During the winter and spring examine the cattle for the presence of warbles. By passing the hand over the backs of the animals the swellings marking the location of the grubs may be readily found. Pressure properly applied to the swellings will cause the grubs to "pop out" if they have reached a late stage of development. They may be more easily removed by means of slender forceps inserted into the opening of the warbles, and a still more certain method of removing them, particularly if the lumps are still very small, is to cut into the swellings with a sharp knife or bistoury, after which they may be pressed out. Care should be taken to crush all grubs removed to prevent the possibility of their further development and transformation into flies. In order that none may escape it is advisable to examine the cattle every two weeks during the late winter and spring, at each examination removing the grubs which have developed sufficiently to cause perceptible swellings. Another method of treatment is to force grease or oil into the opening of the warbles, which kills the grubs. This method is less certain than that of removing the grubs, and has the further objection that the dead grubs remain beneath the skin."

Dates in Alkali

W. R. Nutting gives us some interesting information about growing dates in the region of Fresno. After reading his article I was at a loss to tell whether the date palms thrived because of the alkali or in spite of it. It will also be interesting to know if date palms will extract enough alkali to neutralize the soil and render it suitable for other crops.—Subscriber, Hayward.

We fear the extraction of alkali from the soil by growing dates would be so slow that many generations would be required to see any definite result. As a matter of fact, the success of dates is not because of alkali, but, as suggested by the inquirer, in spite of it. The date palm is very tolerant of alkali, but it must be understood that where alkali is present in abundance the drainage must be fairly good, which, with the liberal irrigation required by the palm, will so control the action of alkali that no serious injury is done the plant. Popenoe suggests in his book, "Date Growing," that "Ancient writers would not hesitate to advise that common salt be added to the soil in cases where it is lacking." But the writer hastens in the next sentence to say "I know of no region where this practice is followed today." Regarding the tolerance Popenoe says: "Best results will be secured if the alkali does not exceed 0.6 per cent, and three per cent may be conveniently taken as a limit beyond which the palm will not grow." Bear in mind that young plants are not as tolerant as old and established palms and also that an immense quantity of water is required during the entire growing season.

Trespass Law

A subscriber writes: "There should be an effort made by farmers associations to have a new trespass law enacted by the present legislature. This law should provide proper penalty for people who allow trespassing of their livestock. Much damage is done to orchard trees and gardens."

It is possibly too late to secure introduction of any bill which would stand much of a show of passing the present legislature. There has been an agricultural committee investigating as to present enactments and preparing and recommending bills which will prove of value to farmers. We believe the bills from this committee have generally been introduced and the state legislature is now settled down to consideration of the various sections. If the particular case referred to by our subscriber is not touched by any of these bills it should be called to the attention of the agricultural legislative committee for consideration at the session of 1923.

Blasting Heavy Soil

Is my soil, which is heavy, too wet for blasting hardpan in tree planting?—Subscriber, Denair.

The soil itself can best answer this question. To secure the answer, dig a hole to the depth where one would place the charge, or perhaps through the hardpan, and observe the subsoil. There has been but little rain this year and it is very probable that the soil would be so dry that there would be little injury, also it may be found that the subsoil is of such sandy nature that there would be little damage, but if the subsoil is found to be heavy and moist enough so it will pack and mold in the hands, it would probably not be wise to use explosives until a period when it is more dried out.

Purple Scale

My orange trees and fruit are both covered with these flakes. What are they?—Subscriber, Los Angeles.

These "flakes" are nothing more nor less than purple scale, one of the worst pests of the citrus orchard, introduced into this state from Florida through shipments of orange trees in 1887 or 1888. It is one of the most serious pests because it not only injures and saps the life of the tree but ruins the fruit. It is not possible to offer the fruit with this scale in the market as it would be immediately confiscated by horticultural guardians. The best treatment is fumigation, or, in case of inability to secure fumigating outfit to accomplish the work, the trees might be thoroughly sprayed two or three times with kerosene emulsion or rosin spray. The case should be reported to the horticultural commissioner who could give more specific information.

Smoking Ham and Bacon

We are going to smoke our own ham and bacon and would like to know what the proper temperature should be in the smokehouse and how long it takes to complete the smoking.—Subscriber, La Canyada.

Cruess gives one of the best materials for producing smoke as spent tanbark. Of course, the old time way of the East was to use hickory chips, but hickory chips are seldom available in California. However, any hardwood, or even hardwood sawdust, is satisfactory, likewise corncobs. Many are using "liquid smoke," a commercial product which may be had even in the smaller towns. This is rubbed into the meat. We prefer natural smoke. As to temperature, care should be taken not to raise above the natural temperature of the house. If it is cold enough so that the meat freezes, then there will not be satisfactory absorption of the smoke. To prevent raising the temperature, unless the house is a large one so that meat hangs five or six feet above the fire, it is best to place the firebox a few feet from the smokehouse and conduct the smoke in large pipe through into the smokehouse. This will so cool the smoke that the temperature will be but little, if any, raised. In his book, "Home and Farm Food Preservation," Cruess recommends smoking continuously for two or three days or three or four hours each day for about two weeks.

Safety Pin

My little girl, age nine months, swallowed a tiny open safety pin, being in her a week before it affected her. Would like to know something to make her pass it? Thanking you in advance.—Subscriber.

This is a form of question which ordinarily would not have attention in this column but would be handled by telegraph, or at least special delivery letter. But the inquirer failed to sign her name other than simply by the word "Subscriber." But, at best, all the advice which can be given in such a case is for the parents to get as quickly as possible the best of surgeon with X ray if possible and follow his advice. Meantime if physician is not immediately available give the child a teaspoon of castor oil in which is a drop or two of turpentine. Ordinarily don't dose babies (nor any one else) but in such a case as this get action.

When you purchase seed remember what your experience was with the last cheap seed you bought, and don't get stung again. It always pays to get the best in seed.

Get the FACTS about this TRACTOR

Before you buy any tractor get all the facts about the Stockton SURE-GRIP and OPEN-WHEEL. These two types of tractor are made in the West—designed by men who know Western conditions—and they will meet your requirements squarely. The SURE-GRIP is a tracklayer and the OPEN-WHEEL is a round-wheel tractor. We want you to have the type that will serve you best.

The SURE-GRIP tracklayer shown above is only 46 in. wide. It will work between the narrowest rows, and gets as close to trees and vines as your tools will permit. It turns in a twelve-foot circle. These tractors are equipped with Herschell-Spillman motors, Bering magnetos, Hyatt roller bearings. There are other features; important enough to make this your choice of tractor, once you know them. Our dealer nearest you will gladly arrange for you to see these tractors in actual operation. Write for complete information. Ask for folder D.

MEN WANTED
TO LEARN AUTOS & TRACTORS IN LOS ANGELES

Are you worried about your present job? Learn Autos and Tractors and you'll have a safe job—able to earn $150 to $400 per month. You can learn in a few weeks. Thousands of National Automotive School graduates now earning big money as repairmen, tractor experts or garage managers. Only school in America giving advanced auto-electrical training and actual garage and repair shop practice. All year 'round tractor field work. Training includes tire repairing, machine shop, driving and repairing all makes of autos, tractors and gas engines. Earn board and room while learning. Success assured. Jobs waiting. Write NOW for FREE Book of Facts telling about your chances in this business. Tells about men from your home town who are successful National graduates.

NATIONAL AUTOMOTIVE SCHOOL
826 S. Figueroa St. Los Angeles, Cal.

5 Great Novelties 20 cts.

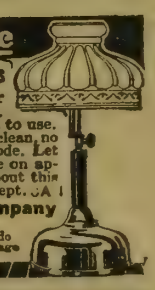
AUTUMN GLORY. A new hardy plant. The most showy Autumn bloomer, surpassing all others. It is the latest to bloom, showing its full glory after frost has killed all tender flowers. Greatest novelty in twenty years. Succeeds everywhere, reaching perfection the first season from seed, and continues blooming for years. 20 cts. per pkt.
Witheach order we send one trial packet each of: PINK WOOLFLOWERS, new—nothing can surpass the mass of pink flowers which it shows all season.
DAHLIA LORD GOFF, lilac pink, in great profusion. Blooms in 3 to 4 months.
JAPAN IRIS, new hybrids of all colors. Magnificent.
DIENER TOMATO, grows to weigh 3 lbs. As smooth and beautiful as an apple. Most startling new vegetable.
And our Big Catalog, all for 20 cts.
Big Catalog, free. All flower and vegetable seeds, bulbs, plants and new berries. We grow the finest Gladioli, Dahlias, Cannas, Irises, Peonies, Perennials, Shrubs, Vines, etc. All prize strains—many sterling novelties.
JOHN LEWIS CHILDS, Inc. Floral Park, N.Y

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

Coleman Quick-Lite



MAKES AND BURNS ITS OWN GAS
THIS Lamp will make your home modern. 300 candle power. Costs but trifle over a cent a night to use. No wicks to trim. No chimneys to clean, no smoke, no odor. Can't spill or explode. Let your dealer get you a Quick-Litee on approval. Write for Free Book about this wonderful home lamp. Address Dept. 5A 1
The Coleman Lamp Company
Atlanta, Georgia.

407 E. 3rd St., Los Angeles.

Household Department

WHAT'S IN A LITTLE BOY

What's wrapped up in a little boy?
All that makes for a father's joy;
The pride that shall shine in a dimming eye
And an old man's peace in the by and by;
Strength perhaps for the manly deeds
Which the world we live in so sorely needs;
Faith for the black, dark hours of test;
Courage in trial to do his best.
What parcels of splendor shall time untie
For a little boy as the years go by?

There, in the baby that rides your knee
When the stars come out, is the man-to-be.
Wrapped in packages, O so small
That you see them not, are the virtues all.
Deep in his breast lie the future years
With your happy days and your nights of tears.
Time's deft fingers shall break the string
Round many a comfort that he shall bring.
Do you dream of an age that shall glow with joy?
Then it's all wrapped up in your little boy.

There are hours he's bringing when you shall sigh
And your heart shall ache, in the by and by;
Though he's O so young and he's frail and weak
There are glorious words for his lips to speak;
There are splendid deeds for his hands to do
And parcels of pride which he's bringing you.
Do you think at night as you stroke his hair
Of the mysteries which are hidden there?
All that you dream of and hope to see
Is bound in the boy that bestrides your knee.

Time shall open these parcels small
And round your feet shall the wrappings fall.
Do you pray for an age that is sweet with mirth?
Your baby brought it with him at birth.
Can greater glory e'er come to you
Than the greatest deed that your boy shall do?
He is little now, but can't you see
A hint of the man that shall some day be?
And don't you know that your every joy
Is now wrapped up in your little boy?
—Edgar A. Guest.

OVER HER LEFT SHOULDER

By Marion Crosby in The Farmer's Wife

DORA DENTON drew a jar of sizzling hot pork and beans to the front of the oven and lifted the cover gently.

"They are going to be just all right," she cried joyfully.

The kitchen was flooded with their rich fragrance. One whiff was enough to give anybody an appetite, even if it had not been a chilly September evening when everyone—meaning Dora and Henry and the three children—was sure to be hungry anyway.

Brown baked beans and all the good things that go with them made Henry's favorite supper. He would come in sniffing while his handsome face beamed happily, exclaiming in his deep, hearty voice, "Oh, that supper smells good! And how's the whole precious bunch tonight" meaning, of course, the three children, to say nothing of Dora.

"Hurry, children; set the table, please. Father will be home now in a few minutes." She worked busily, marshaling her little helpers. "That's right, Maud, help Clara. Bobby, get some fresh water and bring the butter in from the ice box. Oh, we're going to have a fine meal, and all piping hot. Hurrah!" Dora waved the dish towel over her head and pirouetted in the open space between stove and window, to the great amusement of her seven year old son, who was reluctantly starting out for the pump.

Dora was so graceful and pretty and slim that she seemed more like a young girl than the mother of three children and mistress of a rambling old farmhouse where the work, from one year's end to another, was hardly finished as she would wish it to be. She seemed even younger than usual tonight as she danced back and forth singing a gay song. A tiny moonbeam, coming through the window, fell on her yellow hair and gave it a softer sheen.

Suddenly, with a little frightened gasp, she stopped. "The new moon!" she cried. "And I looked at it straight over my left shoulder!" She had been very gay a moment before, but now she quieted down, her gray eyes were clouded and she went on with the supper preparations soberly.

"'Right shoulder, good luck; left shoulder, bad luck!'" she murmured while she cut the bread. "I just cannot help worrying if I see the new moon over my left shoulder. Henry and I do want good luck so much! We have had our share of the other kind."

Little Maud came into the kitchen and industriously began filling a plate from an easily reached cooky jar.

"Never believe in superstitions, Maudie," said her mother.

"No, Mother, never 'lieve in 'stishuns! What is they?" asked the chubby infant between bites of crumbly cooky.

"They are very silly thoughts, Maudie. But sometimes Mother just can't help thinking them. Now, I wish Father would come. It's so late we shall have to eat our supper without waiting. I'll put Father's in the oven to keep hot."

During supper Dora could not forget her "unlucky" first glimpse of the new moon. She hardly enjoyed the hot, tasty supper and spent most of the mealtime attending to the wants of the little ones. "I hate to have this feeling," she said to herself, "but I cannot help it! Aunt Martha taught me to be afraid of bad luck. I wonder what ancestor passed it on to her? I wonder how far back it started, anyway?"

"Clara," she said, turing to her older daughter, who was busy dishing up apple sauce, "have I ever told you about the beautiful locket I used to have when I was a little girl?"

"Why no, Mother," said Clara, eagerly. "What ever became of it, and what was it life?"

"I wonder if I can describe it so that you will know how it looked? It is a long time since I lost it. It was a solid gold locket with a blue enameled medallion on one side, surcounded by a wreath of fine blue flowers. On the other side were your Grandmother's initials in blue enamel. It was her locket. She died, you know, when I was a child."

"It must have been perfectly beautiful," said Clara. "How did you lose it, Mother?"

"I lost it in the brook one day when I was crossing the little footbridge near Aunt Martha's house, down in the valley where I used to live." Dora's eyes had a far away look, as if they were gazing upon that old scene.

"I'll tell you, Mother!" broke in Bobbie. "Next summer we'll all go down there and I'll find it for you. I can swim!" he added proudly.

"It is not very likely that you could find it after all these years, Bobbie." His mother did not tell the children that it had happened at new moon time. Aunt Martha had said, when told of the loss, "Bad luck! You must have looked at the new moon over your left shoulder." Dora had not tried very hard to recover the locket, since Aunt Martha was so positive that there was no use trying to get the better of "bad luck."

She was roused from her recollections by a dire little sound at her elbow. "Oh, Maudie, how could you!" She brought a cloth to sop up the white stream. "Well, well, I suppose you're tired, dear," she said comfortingly. "We are all tired tonight. I wish Father would come!"

It had been a wearying day. Even the children had worked hard, for besides helping gather fruit in the orchard they had wrapped hundreds of apples in paper and packed them carefully away in the attic.

"Come, chickadees, little ones, come on to bed. Clara will help me with the dishes." Dora took a sleepy child by each hand and danced them as far as the foot of the stairs and then marched them up ahead of her in the happy bedtime romp that they loved.

"Good night, sweethearts!" she called on her way downstairs after stowing them in their little white beds.

"Good night, Mother dear!"

At the landing Dora stopped and pulled back the window shade, peering out into the night. She could see no one coming. There was no moon visible. The sky was covered with dark gray clouds and as she waited she heard low rumblings of thunder.

The Cultivator Patterns

BE SURE TO SEND SIZE

3462. Ladies Dress.—Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 6½ yards of 44 inch material. The width of the skirt at lower edge is 1⅞ yard. Price 10 cents.

3454. Girls Dress.—Cut in four sizes: 4, 6, 8 and 10 years. An 8 year size will require 3½ yards of 36 inch material. Price 10 cents.

3456. Ladies Work Dress or Apron.—Cut in 4 sizes: Small, 32-34; medium, 36-38; large, 40-42 and extra large, 44-46 inches bust measure. A 38 inch size will require 4¼ yard of 36 inch material. Price 10 cents.

3446. Ladies Corset Cover.—Cut in three sizes: Small, 32-34; medium, 36-38; large, 40-42 inches bust measure. A medium size will require 1¼ yard of 36 inch material. Price 10 cents.

3147-3447. A Pretty Gown.—Waist 3147 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3447 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. The width at its lower edge is 1⅞ yard. To make the dress for a medium size will require 3⅝ yards of figured and 4½ yards of plain material, 40 inches wide. TWO separate patterns, 10 cents FOR EACH pattern.

3464. Girls Dress.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size requires 4 yards of 30 inch material. Price 10 cents.

3133. Ladies' House Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A medium size will require 5¾ yards of 36 inch material. The width of the dress at its lower edge is about 1⅞ yard. Price 10 cents.

3437. Child's Dress.—Cut in four sizes: 1, 2, 4 and 6 years. A 4 year size will require 2⅝ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEKS; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles

"There is going to be a storm and Henry is out on the road," she said, despondently. She could not shake off her superstitious belief in and dread of "bad luck."

Clara called to her from the pantry. "Daddy telephoned, Mother, but I could scarcely understand what he said. The line wasn't working right."

"Oh, Clara, why didn't you call me?"

"Well, I don't believe you could have heard any better, Mother, and he was gone before I could call you. He said he would be late but I could not hear the reason. There was such a buzzing I think there was something the matter."

"'Something the matter,' 'something the matter,'" ran through Dora's mind as she swiftly did the dishes and stacked them away, warm and shining, uopn the cupboard shelves. And then, as if there had not been trouble enough, she remembered more.

"Clara, you said the postman left a letter this morning with the papers, but it was not here when I came in from the orchard. Do try to find it for me, dear, before you go to bed. Hunt hard. Perhaps it was important. Every letter is important until you find out what is in it.'

"I've hunted and hunted, Mother, and I simply cannot find it," replied the girl in a distressed voice. "It was in a yellow envelope, I remember. What could have become of it?"

"Well, we will both hunt. You take this side of the room and I will take the other," said Dora, and they searched through the tall, old fashione secretary, back of the cushions on the sofa, among the few papers left on the stand after apple wrapping—all over the large, well filled living room. Ned, the big yellow collie, ran playfully from one of the searchers to the other, thinking it was a frolic. He thrust his nose into corners, pawed wrinkles in the rug, and then broke into a loud bark.

Dora stopped and listened eagerly, thinking that perhaps the dog heard his master coming, but she could hear only the thunder and the rain.

(Continued next week.)

HINTS FROM HOUSEKEEPERS

Bleaching Letters on Flour Sacks

I like the Cultivator very much. I am sending a quick and thorough way of bleaching flour sacks. After wetting in warm water, rub letters well with Fairbanks Gold Dust until color begins to fade, roll up and drop in good hot soapsuds and let boil a few minutes. Rinse and hang in sunshine or lay on the grass.—Mrs. W. C., Santa Rosa.

Another One.—To remove lettering from flour sacks, shake thoroughly to remove flour. Rub well with soap and saturate with kerosene. Put in a basin, cover with cold water and boil. Then bleach in the sun.—Subscriber, Watsonville.

Slightly Different.—I never have any trouble in removing the lettering on flour sacks. This is my method: Thoroughly saturate flour sacks with coal oil, roll up tight and let remain over night. Make a strong suds of any kind of washing soap and a little lye. I shave soap into cold water, add lye, put in the sacks and boil half hour. All coloring will be gone.—Mrs. Ed Johnson, Comptche.

Removing Stains From Linen

Wet the stains on your linen with sweet milk and then plunge them at once into the tub containing the suds ready for washing. This is an easy and sure way of removing all fruit, even the troublesome peach, and tea and coffee stains. Do not let the milk dry in the linen, but while saturated place at once in the washtub.

Iron rust may be removed from white goods by boiling in water containing cream of tartar, allowing three tablespoons to a gallon.

Tomato stain may be removed from white goods by applying a paste of cream of tartar and water and laying the article in the sun until it is bleached out.—Irene D. Payne, Bakersfield.

Two Conveniences for the Bathroom

A Blacking Box.—A bathroom stool, made of a box on legs, can easily be made to serve as receptacle for shoe blacking and brushes by the addition of a cover which is hinged in the middle. Nail one-half of the cover to the top of the box, and fasten to the under side of the other half an iron foot support. When the cover is turned back the support will be on top, ready for use, while the rest of the paraphernalia will be in sight within the box.

A Convenient Laundry Bag.—I saw this in a friend's bathroom, copied it in my own, and find it just as good as it looked. Out of five yards of denim, cotton challis or other fairly firm material, fashion a bag 45 inches deep and two widths of the goods from side to side. Make slits at the top large enough to pass a broomstick through, rip the seam in the middle of the front for an opening, rest the broomstick pole on two metal brackets just high enough to make the bag clear the floor, and your bag is done. If the pole is stained or painted and material of the bag harmonizes with the room it will be far from unsightly, and it is certainly very convenient.—Jean A. Koethen, Eagle Rock

IN KITCHEN AND PANTRY

To be prepared to start the kitchen fire quickly saves much time and temper, and failure to make the necessary preparations has caused serious accidents from the use of coal oil. To make a good and safe fire kindler, fill tin cans two-thirds full of fine coal or wood ashes. Then pour in coal oil and stir until the ashes are well saturated. One or two spoonsful of the ashes will light one fire. Another satisfactory fire kindler is fine shavings saturated with pitch and pressed into small blocks.

When baking cakes, and eggs are scarce, instead of using the required number of eggs, one or two may be omitted if a tablespoon of cornstarch is used for each one left out, and the cakes will be just as fine and rich as when the full amount of eggs are used, but be sure and use a very little more milk than the recipe requires.

A good way to fix the cheap cuts of beef, also the round steak, is to grind meat in a food chopper, mix salt and pepper to suit taste, and add some dampened bread crusts. Then thoroughly mix, make out into cakes and fry a nice brown. They are excellent and wholesome.

To keep the silver in daily use and the glass and china dishes shiningly clean, wash in warm suds made with dissolved borax chips, rinse in clear water and dry with a soft, dry towel. Try having enough dish towels to use a clean one every time the dishes are washed, then twice a week wash them out and boil in the soap chip suds and they will keep soft and white as long as they last. This hot suds is excellent for cleaning the pantry floor and shelves and for all cleaning in the kitchen.

Bread crumbs and pieces of dry bread dried in the oven and rolled fine can be placed in a glass jar and kept ready for use. They are fine for scalloped dishes, good in baked meat hash and can be made into toast. Strain a quart of tomatoes, add enough crumbs to make a stiff dressing, flavor with onion, sage, pepper and salt to suit taste, pack in a granite dish and bake and send to the table in the same dish it is baked in, and I am sure you will find it very palatable and quite easily prepared, and at no expense if you have the tomatoes.—A. M. H.

HOUSEHOLD QUERIES

Peanut Butter

Can you advise me through your paper how to make peanut butter from Spanish neanuts?—Subscriber, Pomona.

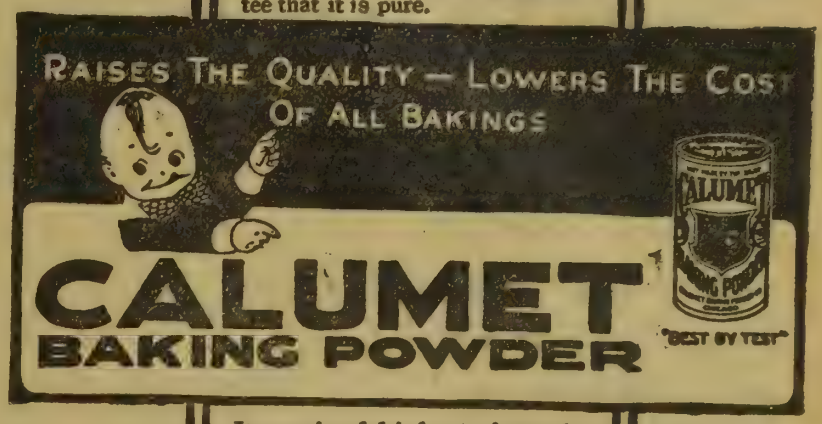
Peanut butter can be readily made at home by putting peanuts through ordinary kitchen food chopper, if it is equipped with the pulverizer knife. Put through chopper first with coarse knife to break in small pieces, then with the finest knife or pulverizer. This pure fresh peanut butter is the product usually sold, but some apparently has had salt added and much of the oil drained off, leaving it rather dry.

YOU certainly want to save money, and you would like to have better bakings.

Then use Calumet. It's the biggest thing you can do to improve the quality of your bakings—and lower baking costs.

Calumet is made in the largest, most sanitary Baking Powder Factories in the World. No Baking Powder is made under better conditions—none can be better in quality.

It contains only such ingredients as have been officially endorsed by the U. S. Pure Food Authorities. An absolute guarantee that it is pure.



It received highest Awards, World's Pure Food Exposition, Chicago — Paris Exposition, Paris, France—positive proof of its superior merit.

It is used by more housewives, domestic scientists and chefs than any other brand. That would not be the case, if it were possible to secure a higher quality leavener.

It is sold at a moderate price. All you have to do is to compare costs to determine how much you can save by buying Calumet.

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Cream Cake Recipe

—3 cups pastry flour, 3 level teaspoons Calumet Baking Powder, ½ cup butter, 1¼ cups granulated sugar, Yolks of 3 eggs, ¾ cup cold water, Whites of 3 eggs. 1 teaspoon orange extract. Then mix in the regular way.

PEARL OIL
(KEROSENE)
HEAT AND LIGHT

Baby Likes It

His daily bath is a real pleasure when he has it beside the warm glow of a good oil heater—filled with PEARL OIL. And mother knows that the heater is guarding his health—and she can use it in any room of the house.

PEARL OIL is clean-burning—no smoke—no odor—for it is refined and re-refined by our special process. Economical. Sold in bulk by dealers everywhere

At Sacramento

By R. P. Royce

The agricultural committee of the assembly consists of the following members: Parker, chairman; Beal, Bernard, Broughton, Christian, Cleary, Cleveland, Colburn, Cummings, Kline, McCloskey, Merriam, Powers, Ream, Spalding, West and Windrem.

Senator B. F. Rush has again introduced a bill to restrict the running of dogs at large. The bill is designed to protect livestock men from depredations of dogs and requires that all dogs be licensed by counties. Provision is made for the collection of damages by owners of stock injured by dogs. It is more than likely that the bill will again meet strong opposition from a lot of sincere but misguided folks, and it should be made a special point by all interested in the livestock industry to urge its passage. It will be known as Senate Bill 119.

Senator Rush has also introduced a bill to regulate and supervise race meetings. The bill is calculated to encourage the breeding of race horses and proposes to eliminate gambling by having the control of such meetings in the hands of a state racing commission. The bill provides a penalty for making public the list of entries in any race prior to the race. The bill has the support of the large horse breeders of the state.

Senator Purkitt of Willows has introduced a bill that he says is intended to break up large land holdings in California. The bill would specifically prohibit corporations hereafter from engaging in farming or stock raising and would prevent any existing corporations from engaging in either occupation. A graduated tax is proposed on all agricultural land in excess of 1,000 acres, or grazing land above 2,000 acres. Another purpose of the measure is to prevent the inheritance of large bodies of land and to compel the cutting up of present holdings.

The agricultural committee of the assembly has recommended the adoption of the West resolution, which calls for an investigation of the college of agriculture and the university farm.

The California farm bureau federation is seeking the passage of a measure to regulate the warehousing of grain The bill would place the warehouses of the state under the control of the state director of agriculture. The director is empowered to set standards for agricultural products; to regulate the methods of weighing; to supervise the licensing of warehouse owners; to require such owners to post a bond and pay a fee for examination and inspection of warehouses. The period of the license is for one year. The bill carries with it an appropriation of $50,000.

Duncan has introduced a bill in the senate to prohibit all aliens from owning agricultural land and limiting the leases to such persons to three years.

The California State Irrigation Association will present a bill asking for an appropriation for a survey and investigation of the water and power resources of the state. The association is backing the Marshall plan.

One of the most important agricultural bills introduced in the present session is the one offered by Rigdon, chairman of agricultural committee of the senate, and known as the pure seed bill. The bill proposes to regulate the sale of seed in this state and in substance will guarantee seeds to be free from noxious weeds and other adulteration. Such a bill was passed last legislature, but was vetoed by the governor. It is rather certain of passage this year, as it has the backing of the agricultural organizations of the state.

Certain amendments are planned for the present hide and brand law.

An effort will be made to have the slaughter of meat animals placed under the supervision of the state board of agriculture. Such inspection will not interfere with the government inspection now operating at certain plants engaged in interstate shipment.

WET THAT SUBSOIL

(Continued from Page 99.)

develop sugar content the trees in general took on a withered and ragged appearance. Here and there orchards, particularly of apricots, shed the greater part of the leaves, leaving the bare branches laden with sunburned fruit. Gumming of the fruit, twigs and branches has been worse than in ten years, particularly so with plums and apricots, although the peach has also suffered severely.

At the present time deciduous orchards in general, and particularly in dry farmed districts, are showing weak fruit bud formation for the coming year.

Vines have failed to make a satisfactory growth in many districts and have not ripened up and matured their wood in the usual way.

With citrus trees there have been various symptoms of drouth injury. Internal decline or blossom end rot of the lemon has been more prevalent than ever before and has extended later into the winter. While this trouble is now under investigation and important information may be forthcoming shortly, the writer ventures the assertion that this rather new and serious disease is primarily due to prolonged drouth injury.

The average size of oranges is much smaller than usual both with Navels and Valencias, clearly reflecting scarcity of water. Indeed, in many districts it is doubtful whether Valencias can be brought up to marketable size on account of the unusual smallness of the fruit at the present time. In certain districts Navels are beginning to drop in the same manner as they normally do late in the season, indicating early maturity occasioned by water shortage. A peculiar mottled and pinched condition of the foliage is rather widespread in certain districts where a water shortage has existed all season.

Walnut growers have not been without their troubles due to drouth effects. Crop estimates ran nearly one-quarter over the crop actually harvested, this being due to the unusually high percentage of "blanks," or non-filled nuts. Walnut growers everywhere testify that the percentage of "blows" has been most abnormally high.

Recognizing the signs of injury from abnormally dry subsoils early last spring, the agricultural extension service for Los Angeles County launched an educational campaign for a better knowledge of soil moisture conditions on the part of orchardists through the greater use of the soil auger. Professor J. W. Nelson of the college of agriculture cooperated in conducting field meetings at which more than 1,000 growers were in attendance. The Los Angeles County farm bureau cooperated by financing the manufacture and sale of soil augers to members at cost. Approximately 100 augers were handled by the organization and the campaign resulted in nearly 500 augers being put into use.

There is still need for driving home the necessity for closer attention to soil moisture problems in the orchard. The rainfall to date has not been sufficient to wet the soil down to a depth of more than 15 to 18 inches. The subsoil is dry, drier than has been the case for years. Hundreds of borings made by the agricultural extension service have shown this to be the case quite generally. Spring may be here in six weeks or so with the trees renewing growth for the season.

It is of the greatest importance that these dry subsoils be wet before that time, else serious results must be expected. It will take six inches of good steady rain, all soaking in without any runoff, to accomplish this wetting. We may, perhaps, receive this much rainfall before spring. We may, and probably will not. It is unsafe to wait. Filling that subsoil up now will reduce the amount of water necessary to apply next season.

In most soils the winter season is the only time when the subsoil can be wet thoroughly without endangering the health of the trees. And with most soils it is also the only time when it can be wet at all. Can you afford to take a chance?

Imperial County farming lands of large extent, and to the value of over $600,000, changed hands recently, Los Angeles capitalists being the purchasers.

How Much are YOU Leaving Unharvested?

February 16, Diamond Bar Ranch, Spadra.
February 17, Falfadale Farm, Perris.

Percheron Horses

February 17, M. Bassett, Hanford.

Elmer Lamb, one of the pioneer breeders of Durocs in this state, has sold the remainder of his herd, except Mary Jane Pathfinder, to E. G. Stone of Modesto, who has leased his ranch. Mr. Stone is a new man in the pure bred business, but is an old timer at hog feeding. He will be cordially welcomed by the Duroc men. Mr. Lamb's health failed about a year ago and he now plans to spend some time touring the state with his wife and daughter. He may also visit the East during the coming summer.

Anoakia Walker Pontiac, the Santa Anita heifer who broke the seven day record for senior two year olds, also broke the 30 day record for the same age when she made 102.81 pounds of butter from 1,898.3 pounds of milk. The former record of 102.38 pounds was held by Miss Valley Mead De Kol Walker and was also made at Santa Anita before she was sold to A. W. Morris & Sons.

Carl Fuechter of Sonora, Mexico, has purchased from The Lewis Company of San Jose, a good son of their herd sire, Ormsby Segis Marie Lad.

Poland China breeders of the state will regret to learn of the death of W. A. Young, Lodi, from heart trouble, January 9. Mr. Young was one of the pioneer breeders of Poland China hogs in the state and was for many years quite prominent as a showman, winning many prizes at the various fairs. He was very enthusiastic and no doubt helped start as many new men in the business and as many good herds as any one man in the state.

J. P. Walker, Visalia, recently purchased ten September yearling Duroc gilts from Conejo Ranch, Newbury Park, some of the best to be found in any one herd in the state, and quite an asset for any breeder to own. Like most of the progressive breeders of the state, Johnny Walker reports business improving. He has made quite a number of good sales recently and has had to make several purchases to fill orders.

The catalog for the big dispersal sale of Durocs at the Falfadale Ranch is ready for mailing. The sows and gilts booked for the sale are in excellent shape and most of them will be heavy with pig on February 17 when they go into the ring. The champion boar, Great Orion Sensation Junior, doesn't seem to be worrying much as to where he will live after that date. He knows he is so valuable that whoever buys him will see to it that he has every comfort. It is going to be a great sale.

The 1921 Holstein Guaranty Sale will be held at Sacramento on Thursday, March 17. It was originally planned to hold this sale at Tulare, provided the proposed new hotel was completed there, but the hotel has not yet materialized. According to announcement of California Holstein-Friesian Association the entries this year will be limited this year to not over 60 head. In females only cows and bred heifers will be selected, and there will be only a very few outstanding young bulls. The committee of selection appointed by President F. L. Morris is composed of G. M. Brown, Los Angeles; Alex Whaley, Tulare; H. V. Bridgford, Patterson, and C. L. Hughes, Sacramento. This committee has also been instructed to select cattle in California only from the herds of members in good standing of California Holstein-Friesian Association.

Princess Boweda Alcartra, a junior two year old Holstein heifer, owned by Sunnybrook Ranch, Willits, has just completed a seven day record of 21.029 pounds of butter from 538.5 pounds of milk. The above record was made in the third week of strictly official 30 day test. The first week of her test she made 20.47 pounds of butter from 450.5 pounds of milk. This promising heifer is a granddaughter of the 37.52 pound cow, Boweda, formerly owned by the Bridgford Company of Patterson and now owned by the Carnation Stock Farms, Seattle. Herdsman Gelder expects to put the dam on test as soon as she freshens in March.

The California Duroc-Jersey Breeders Association has decided to hold the annual sale of bred sows and gilts at the university farm, Davis, February 5. The association has discarded plans for holding sales at Tulare and Los Angeles. A special effort will be made to assemble an offering of extreme class and in order to do so the leading herds will be called upon for entries. J. P. Walker of Visalia, secretary of the association, is in charge of the event.

Another good seven day record has been made in the Jane Garden Holstein herd, owned by Fred W. Kiesel of Sacramento. Sterlin Colantha Duchess, a senior three year old, has a production of 27.94 pounds of butter from 424.2 pounds of milk to her credit. Herdsman Harry Redd reports that the 34 pound cow Mansell Korndyke Francis has produced 93.26 pounds of butter from 1,541.2 pounds of milk in 20 days. Thirty-eight cows are now on semi-official test in the Jane Garden herd.

Eighteen Holstein, Jersey and Ayrshire bull calves owned by members of the Petaluma Calf Club were sold at auction, January 12, for an average of $262.50. The top calf sold for $700. Col. Cy N. Clark of Modesto was the auctioneer. Plans are now being made for the formation of a club to develop heifer calves.

CALEDONIA SHORTHORNS

Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

CALEDONIA FARMS
WEST SACRAMENTO, CALIF.
OFFICE-57 POST ST. SAN FRANCISCO.

Guernsey Females

Our herd reduction sale still continues and there is a lot of fine Imported and A. R. cows with high production records and show ring honors left to be sold. We are also offering the choicest lot of young stock ever in one herd in the West. A number of bulls of all ages from the above sired by King of Hollow-Hill and Effie's King.

Also 30 head of females 15/16 Guernsey that will make wonderful family cows.

All T. B. tested and guaranteed breeders.

Everything Priced Reasonably.

The Cow and the Man

ONCE upon a time a little girl and her mother were making a visit, the first one for the little girl, in the country. The housewife thought perhaps the child had not been favored with milk with any excess of cream, so she made a special point of giving her a glass of particularly rich milk. It was barely tasted and left in the glass. The mother asked the child afterwards why she did not drink it, and the child replied: "It was so yellow; not nice and blue like our milk in Boston."

There are a good many "farmers" in California, recently here from professional life in the East, whose knowledge of a dairy cow is about on a par with that of the little Boston girl, so we have asked for some hints or first reader lessons in the care of the family cow from R. A. Condee, instructor in agriculture in the Ontario Junior College of Agriculture, also director of agriculture of the George Junior Republic near Chino. Mr. Condee is too busy a man to sit down and write as we know he can, but he has given us a few notes from which we gather the following:

First, the cow cannot make milk without water. Some people have an idea that the purity of the water has nothing to do with the purity of the milk. Presumably the cow's digestive apparatus is so arranged as to eliminate impurities, but there are limits, and it is just as easy to keep a supply of pure water before the cow at all times.

Thousands of cows in California are never under shelter from sun or rain, and they do well, for our climate is mild. Yet there are seasons when protection from the sun's rays and attacks of flies is essential if one expects fullest return from a faithful creature. If the shed or stall is not dark enough to give the animal protection from flies, some help may be had from fly repellents, of which there are several very satisfactory ones offered by the trade. Again, protection from a norther, or driving rain, will result in saving expensive feed from being used up as fuel.

In the matter of feed nothing is quite as good as alfalfa pasture, but one warning is necessary there, and that has to do with bloating. A hungry cow turned on dripping, lush alfalfa is very likely to bloat, and in severe cases of bloat there is danger of sudden death. Some cows seldom bloat, but where they do or where their tendency in this direction is not known, they should be kept from the field until the sun has had an opportunity to thoroughly dry and even partially wilt the grass. In case of pasture, or where fresh alfalfa is available, it is not necessary to give such close attention to the cow before calving time, but if she has been kept on dry hay there should be care in giving laxative feeds and proper conditioning for a couple of months. A ration suggested by Mr. Condee consists of equal parts ground barley, bran (wheat), soy bean meal and cottonseed meal, feeding about one pound to each 200 pounds weight of cow. An 1,800 Holstein would have nine pounds of this grain ration, while a 900 pound Jersey would receive 4½ pounds of grain ration per day, all the alfalfa hay she will eat, and if possible 10 to 15 pounds of cut stock beets.

A cow must be in good physical condition before calving, but must not be over fat. She must start her lactation period with enough (grain) flesh to carry her through the first 60 days of her heaviest producing period.

After the cow freshens leave calf with her for 24 hours, then remove calf and milk out the cow, being careful not to strip her at this time. In six hours after calf is removed milk her out, being sure to examine her bag, and it is well to rub thoroughly with camphorated vaseline. Milk can be used after the ninth milking. Start feeding by giving a good feed of chopped beets and let cow have all the alfalfa hay she will eat. Start grain feed on the third day after feeding, and up to seventh day, feeding 1 pound grain to 10 pounds milk produced—following ration: 100 pounds bran, 50 pounds corn meal, 50 pounds beet pulp, 20 pounds cottonseed meal, 80 pounds ground barley, 3 pounds charcoal.

After the seventh day feed any standard mixed dairy feed or the following ration: For every four pounds of milk give cow 1 pound of grain feed, with what alfalfa hay she will eat, cut beets, 25 pounds, or silage, 25 to 35 pounds, daily.

Home Mixed Grain Ration

(Salt before her at all times.) 200 pounds bran (wheat), 100 pounds corn meal, 100 pounds beet pulp, 100 pounds cottonseed meal, 100 pounds soy bean meal, 200 pounds rolled or ground barley, 4 pounds charcoal.

A MODERN WAY OF MILKING

By N. J. Daysh

A LOSS of $200,000,000 a year, or $10 per cow, is the estimated toll that the dairy farmers of this country are paying for poor hand milking. The question naturally comes to every thinking mind, why spend money for expensive breeding, feeding and housing if the full benefits are partially lost in the act of extracting the milk? There can be but one answer—the modern milking machine, which will not only check this loss, but will save a great deal of time as well.

Dairymen know that a cow is an extremely temperamental animal and that she quickly reacts to abuse, harsh language, and any adverse conditions to such an extent that her milk flow is greatly diminished. However, it is not so well known that apparently little things, such as a change of hand milking, a change in time of milking, or a variation in the speed of milking, also cut down the flow of milk.

Dr. Babcock, the great dairy authority, proved this some years ago in exhaustive experiments on many cows in Wisconsin. During these tests milkers were changed frequently, cows were milked fast and slow, and every condition that exists on the average dairy farm was approximated. Observations made of the variations in the flow of milk from day to day because of improper milking caused Dr. Babcock to make the statement that the dairymen of Wisconsin were losing $19,000,000 a year, or $10 per cow. Dr. Babcock's experiments proved that good milking increased both the quantity and the fat content of the milk produced.

Hand milking is a job which is disliked by farm hands, and boys leave home on account of it. Indifferent milking is to be expected under such conditions. But even good hand milkers cannot milk with machine like uniformity from day to day, hour to hour, and minute to minute. It is humanly impossible. Hands get tired, moods vary, and when a milker is irritated he is bound to take it out on the cow. Then there is the constant hurry to get through, as milking is the first task in the morning and the last one at night. When all these things are considered it is not surprising that even under the best of conditions cows are not milked with absolute uniformity. And it is this lack of uniformity which is costing our dairy farmers $200,000,000 a year in decreased milk production, to say nothing of the loss in time as compared with milking by perfected mechanical milkers, which may be worth an equal amount.

Heretofore the chief argument for the use of a mechanical milker has been the time saving feature, convenience and means of keeping the boys and hired help satisfied. This is all true, and the saving of time alone is enough to justify the purchase of a good milker. The fact that it saves time twice a day, every day in the year, is more than can be said of any other farm machine, with the exception of the cream separator, and many of these other machines cost more than a milker.

A correctly designed mechanical milker is not merely just as good as hand milking—it is better.

To make a mechanical milker that would be positive and uniform in ac-

Jas. J. Jeffries Dispersal

65 Registered Holsteins

Jeffries Ranch
Burbank, Cal.
Thursday, Feb. 3, 1921
at 10 A.M.

Featuring one of the highest quality offerings of high record, richly bred Holsteins of outstanding type ever submitted to the Western Public.

K S P J PET SEGIS

KING SEGIS PONTIAC JANNEK, the famous Jeffries herd sire, will be sold. He is only six years old, straight and right in every way, and a proven sire of outstanding merit.

A few of the other individuals and groups include:

BARRON ANNABEL LILITH, 38.28 pounds butter in 7 days, now making a big yearly record. She is the highest 7 day record cow ever sold in California. Two of her daughters and one son, all of King Segis Pontiac Jannek, are in the sale.

MAID TUEBIE SEGIS, 1,140.95 lbs. butter in one year. She is the highest yearly record cow ever sold in California. Her splendid young son by King Segis Pontiac Jannek also sells. A real herd bull for someone.

K S P J PET SEGIS, the wonderful heifer whose picture appears above. She was Grand Champion at Los Angeles, 1920, holds the California records for a junior 2 year old for milk in one day, seven days, and 30 days, milking 99.6 lbs. in one day with first calf. Now making a great yearly record.

DE KOL PET SEGIS, dam of the Grand Champion, now making a big yearly record. Her son also sells, a full brother to the Grand Champion, and himself a show bull.

SEVEN 27 TO 30-POUND COWS, several on yearly test, and practically all of them have one or more beautiful daughters by King Segis Pontiac Jannek in the sale.

MANY OTHERS with records up to over 25 lbs. butter in 7 days, great individuals and splendidly bred.

THIS IS POSITIVELY ONE OF THE RARE OPPORTUNITIES TO SELECT FROM A HERD OF HIGH UNIFORM QUALITY.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer except as announced in sale ring.

C. L. Hughes, Sales Manager, Sacramento, Cal.

tion at all times and still embody all features necessary to successful milker operation has required many years of experimentation. If all the milk were secreted and held in the cow's udder before milking, its extraction by a mechanical milker would be very simple, and the problem would have been solved many years ago. A pump would do the work. However, approximately 85 per cent of the milk is secreted or manufactured during the process of milking. Unless the method of milking is uniform and pleasing to the cow, secretion is interfered with and she holds up her milk, and if this is done repeatedly an early drying up of the cow or a congestion of her udder and injury results. Briefly, that is the problem that has been solved.

The use of the right milking machine will result in increased production of milk, a saving in time, and will eliminate one of the greatest drawbacks to dairying—hand milking—all of which will bring greater profit and pleasure to the dairyman, elevate and stimulate the entire industry, and benefit all humanity by abundant and clean supplies of man's best food.

BACK TO LIVESTOCK—AND SAFETY

(Continued from Page 101.)

duced on the place as possible, in order first of all to conserve the soil fertility and, second, to furnish a market for grain and roughage. There will be times when grain feeding is not profitable, but if one "sticks to his last" over a period of years he will come out all right.

Year in and year out nearly every ranch of sizable acreage produces more or less feed in the form of grass and roughage and waste that could be put through livestock at a profit.

The majority of our ranchers who have grain in storage (some have crops for several years in storage) would not be so strictly up against it as they are just now if, instead of putting all their eggs in one basket, they had diversified their operations sufficient to handle some livestock.

Any community or group of producers that depends solely on one primary crop; barley, beans, wheat, rice, or cotton, even alfalfa, has deliberately placed itself at the mercy of the market. Take, for example, the barley situation at present. Warehouses from one end of the state to the other are loaded to the roofs. There is practically no market. Now and then we hear of small sales ranging from $1.10 to $1.30. No one knows just what to expect, but all know that the crop must move eventually. Incidentally, barley is relatively higher than corn, so it won't go East for feed. It is too much to expect that much will be exported. The grain buyers know very well that the owners haven't livestock to feed and they can bide their time in buying. Now it so happens that barley can be put through hogs at present prices and have a value of above two dollars. If our ranchers had the hogs they could find a market for their grain and at the same time materially reduce the surplus and by so doing greatly relieve the market.

Furthermore, the average grain rancher hardly knows which way to jump just now. Only this morning an extensive grower was talking to the writer and made the following remark: "For one of the few times in my life I don't know what to do. I've got over a thousand acres that have got to produce this year, but I can't figure what to plant. My barley hasn't sold, and it looks as though barley won't pay next year. My bean crop was a total loss—the early rains got the beans—and I've about had my fill of beans anyway. I'll probably sow some alfalfa to take the place of what I plowed up to grow grain during the war. I've got some cattle, but I haven't got enough. I've tried to locate some feeder hogs, but they're not to be found. I've learned my lesson, though, and from now on I am going to keep more livestock. I've always got more or less grass and roughage that would otherwise go to waste, and I might as well turn it into cash."

On my desk is a letter from a well known hog feeder who took a flyer in rice, and he closes by writing: "From now on I guess I'll stick to cows and hogs; they're a little slower but they are pretty sure."

I know of other livestock men who took their flyers in speculative crops who say "Never again," and I have heard any number of grain growers make statements to the effect that they intend to depend to a greater extent on livestock.

So it goes up and down the state; more and more men are figuring on the possibilities of livestock, and it is more than likely that during the coming year many men will either make a start with or reengage in livestock.

To those men who go in to stock raising it is of the greatest importance that they start right. They should realize that the keeping of any kind of livestock is not an easy road to travel. There is a difference in cattle, either beef or dairy, in hogs and in sheep. Some are good, others inferior. The good sorts will pay a profit under most conditions; the inferior kinds will make a loss. No man can afford to handle inferior stock of any kind. A good many men seem to think they can, but their bank rating tells the story. Good livestock will cost more than the other kind; it is worth more. Try to get the best. Try to get pure bred sorts, not with the idea of becoming a breeder, but because pure bred stock of any kind is more efficient—contrary to what a lot of your well wishing friends might tell you. The ownership of pure bred animals does make one eligible to be a "breeder," but it also carries a certain responsibility and that responsibility concerns proper care. Good blood will respond almost in direct relation to the care it receives. Care does not mean "hothouse" methods, but rather providing proper feed, exercise, sanitation and reasonable shelter.

With wider use of good livestock California agriculture will be on a more permanent and satisfactory foundation than we can claim at the present time.

NATIONAL TRACTOR SHOW

The American Society of Agricultural Engineers, with the cooperation of practically every university of the country, will present a unique educational exhibit at the sixth National Tractor Show, to be held at Columbus, Ohio, February 7 to 12.

Unlike all previous tractor shows, this event is stressing heavily the educational and service features, being the first of its kind in which educational institutions are so vitally interested. Selling will have no part in the week's program, as it has had in previous shows of the kind. E. E. Whaley is manager of the show.

CHANGE IN RULES

No animal over two years of age will be accepted for registry in the American Shorthorn Herd Book after February 1, 1921, or in the case of animals imported from Great Britian or Canada two years after date of importation. After January 1, 1921 a fee of $5 will be charged for entering the pedigree of an animal between one and two years of age. Formerly the charge was $10. Seller must furnish transfer and pay transfer fee. Twin animals must be entered for registry at the same time.

Absolute Dispersal---W. A. Thompson Herd

66—REGISTERED HOLSTEINS—66

Rhoades & Rhoades Sales Pavilion, Hynes, Cal. Saturday, February 5, at 10 A.M.

This will be an absolute dispersal of the herd owned by W. A. Thompson, Holtville, California, and contains a large number of females of most attractive breeding, as well as a number of young bulls of like breeding. Included in the sale list are

A DAUGHTER OF KING MEAD OF RIVERSIDE, out of a half sister to Tilly Alcartra that made 933.49 lbs. butter from 22,675.2 lbs milk in one year.

A DAUGHTER OF PRINCE GELSCHE WALKER, with 722.68 lbs. butter from 16,142.9 lbs. milk in one year as a junior 2 year old, her dam with 842.85 lbs. butter in one year. Her daughter by King Morco Alcartra, son of Tilly Alcartra, also sells.

A DAUGHTER OF PRINCE GELSCHE WALKER, with 18.25 lbs. butter in 7 days as a 3 year old, her dam a yearly record daughter of a 22 lb. cow.

A DAUGHTER OF KING MEAD OF RIVERSIDE, out of the above daughter of Prince Gelsche Walker.

A 27.86 POUND COW and her two daughters, both by King Morco Alcartra, Jr., who is by King Morco Alcartra and out of a daughter of Aaggie Acme of Riverside.

A 22 POUND GRANDDAUGHTER OF KING OF THE PONTIACS, and her daughter by King Morco Alcartra, son of Tilly Alcartra.

A GRANDDAUGHTER OF KING SEGIS PONTIAC, out of a yearly record daughter of a yearly record cow, and her two daughters by King Morco Alcartra, Jr.

A GRANDDAUGHTER OF ARCADY CORNUCOPIA JOHANNA LAD, out of a 25 lb. dam.

A GRANDDAUGHTER of the 820 lb. yearly record cow Heg Rector 2nd, and her daughter.

A DAUGHTER OF A 32 POUND COW that milked 723.4 pounds in 7 days.

A DAUGHTER OF KING MORCO ALCARTRA, out of a 17 pound junior 2 year old daughter of Prince Gelsche Walker, second dam a yearly record cow with 795.11 pounds butter from 17,591.5 pounds milk.

MANY OTHER COWS with official records up to over 21 pounds butter in 7 days.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER EXCEPT AS ANNOUNCED IN SALE RING.

HAMPSHIRE SWINE RECORD ASSOCIATION GROWS

During the year ending June, 1920, the American Hampshire Swine Record Association increased its membership 14,300 persons, 6,666 of these new members being in the state of Iowa alone. This increase shows a remarkable interest in the black hog with the white belt.

Known originally as the "Thin Rind," they were imported to the United States from England. The Hampshire originated in Scotland and drifted from there down into Hampshire, where they were taken up in earnest, and by selection and breeding the type greatly improved. In order to distinguish them from the heavy hided, fat hogs in vogue at the time in this country, the original importers of the Hampshires made much of the thin skin of their chosen breed, and the first record association founded at Earlanger, Kentucky, was called the American Thin Rind Association. This was later merged into the present record association. On account of the tenderness and edible quality of their meat these hogs were raised for meat rather than for fat, the thin rind being noted among all other breeds of that day for "a streak of fat and a streak of lean," which packers now days call "marbled," clear to the rind. This characteristic, retained through all the intervening years, together with their great length of body from shoulder to ham, make these essentially a bacon producing hog.

The Hampshires have been great winners in all shows in the barrow and dressed hog contests in competition with the other breeds. They have been successful in the car lot classes at the Chicago International for the past three years.

There are a number of very substantial herds of Hampshires in California now, including the O. U. R. herd at Santa Barbara, the Llano Vista herd at Perris, the Fairbanks herd at Redlands, the Tarzana herd at Van Nuys, and the Rio Hondo herd at Compton.

The California breeders are very progressive and are evolving a type of Hampshire that will have good bone and feet to go with the long deep sides which are so well known. Great strides in the improvement of the breed are being made by these up-to-date Westerners and the Hampshire Association will undoubtedly have many new members out here as well as in the East.

BASSETT, ROSS AND CRAWSHAW SALE

On Tuesday, February 15, Messrs. Bassett, Ross and Crawshaw, Hanford, will sell 25 bred Poland China gilts selected from their three herds. This will be a choice offering and deserves the support of the Poland China breeders of the state. The sale will be held at the fair grounds. In the forenoon Mr. Bassett will sell 20 high class Percheron horses — stallions, mares and geldings. This sale marks Mr. Bassett's retirement from the horse business, in which he took a great interest and was very successful.

THE C. C. ELLIS DUROC SALE

C. C. Ellis of Exeter has gone steadily forward laying the foundation for a real herd and getting ready for the prosperous times ahead. Mr. Ellis has not only one of the largest herds of Durocs in the state, but one of the best. He recently purchased the entire herd of Durocs from E. Avery Newton of Lankershim. He has selected 40 top sows and gilts from this herd and his own to put in the sale at Tulare, January 29. This is one of the most useful lots of females to be found anywhere and will make money for the buyer. Mr. Ellis deserves a lot of credit for his efforts and the Duroc men should give him their support in his first sale.

Much of the stock offered in this sale are prize winners and practically all are from prize winning blood. There are champions and grand champions and more of firsts and other good money winners. In one small bunch there are winners of seven firsts in Ventura and Owensmouth fairs of 1920, and in the same bunch there are others who were winners in '18 and '19 fairs. Best of all, the herd boar, Uneeda Orion B, has made something of a record through his pigs which have been winners at various fairs in California. At the Glenn County fair this last fall 11 of his pigs were in the money.

HOLLOW-HILL FARM
COLTON, CALIFORNIA

G. W. Wilder, Proprietor

Guernsey Dairy Cattle Duroc Jersey Hogs

December 31, 1920,

To the Editor,
Livestock Department,
California Cultivator,
Los Angeles, Calif.

My Dear Sir:

I thought you might be interested to know that since we have been advertising in the California Cultivator the Guernsey pure bred females and Guernsey grade females for sale, within the last three weeks we have sold three pure bred females at an average price of $1,083.33, seven pure bred bull calves at an average price of $321.42, nine grade female cows at an average price of $317.77, and 13 grade heifers at an average price of $183.84. The men who have bought pure bred Guernsey sires and Guernsey females include: B. F. Bowen of Riverside, Hans Mortenson of Santa Rosa, Alfred Peterson of El Centro, Walter Young of Artesia, B. H. Fish of Santa Barbara, B. M. Lederer of Chino and W. E. Bush of the Canada Vista Rancho of Covina, H. J. Fay of Anaheim.

I thought you would like this information.

Yours sincerely,
B. W. SHAPER, Bus. Mgr.

S:E

T B TESTED HOGS

The Italian Vineyard Berkshire herd is one of the very few herds of tuberculosis tested hogs in the country Believing that hogs are particularly susceptible to tuberculosis and wanting his herd to be free if possible, Superintendent Wilson had the entire herd tested. Members of this herd have come from all over the country and out of all sorts of conditions, but the number of reactors was very small and happily only a couple were from among the sows bought for foundation stock.

Tuberculin testing of hogs is a courageous act as the law requires every hog that reacts to the tuberculin test to be branded, which of course renders it useless either for a breeder or for pork. All the sows in the big sale on February 1 are tuberculosis free and cholera immune.

TUOLUMNE WATER RIGHTS

Tuolumne County irrigators are fighting for their rights as to water and the rates which shall be paid for it. Appropriations of water were made with the declaration that they were to be dedicated to agricultural and mining purposes in that county. It has been suggested that certain ditches be abandoned and that the rate per inch be increased. The matter of power house construction also enters into the contention, to all of which there is no objection providing "a stipulation is first made that Tuolumne County water users will be fully supplied with good service." There will be hearings before the railroad commission at Sonora on January 25.

OPEN NEW SALES PAVILION

Over a thousand dairymen and their families, a perfect Southern California day, a herd of grade Holsteins that averaged over $190 per head; Senor Jose Romero, the famous Spanish barbecue chef were the high lights of the opening sale at the new Rhoades & Rhoades Stock Yards and Sale Pavilion at Hynes, on January 14. Over 400 machines parked about the place.

A peculiarity of the dairy industry in Southern California is the fact that only a very small percentage of the heifer calves are raised, which necessitates the shipping in of outside cattle to replenish the dairy herds. To give the shippers a convenient location to handle such shipments, Rhoades & Rhoades of Los Angeles have built what is without a doubt one of the finest and most completely equipped privately owned stockyards and sales pavilions in the United States. The yards are located at Hynes, 16 miles south of Los Angeles in what might be termed the heart of the dairy center. Within a radius of 15 miles a large proportion of the whole milk supply of Los Angeles is produced. The sales pavilion is completely enclosed with plenty of windows for light and air, large exits in case of fire, comfortable seats and a perfect ring for the showing of cattle. The lighting system is very effective and the acoustic properties of the building are extremely good.

In addition to the handling of dairy stock another building for horses, mules and the housing of farm machinery has been provided. The facilities of the stock yards and the sale pavilion not only appeal to shippers but to local dairymen as well as many of them remove their cattle to the yards and hold sales there in preference to their own farms. People interested in dairy cattle may now avail themselves of the opportunity to inspect this plant as well as the great herd of registered Holsteins at the W. A. Thompson dispersal sale to be held there on February 5.

SAYS FARMERS WANT HOGS

"Sentiment seems to be growing among farmers that it is now time to return to the business of producing pork. Evidence is found in the recent sales at which most of the buyers have been farmers," says Bruce S. Bennett, formerly of the Western Berkshire Congress, who goes on to say: "Feeds are cheaper and in many localities skim milk is going to waste for lack of sufficient livestock to consume it. The farm bureau auction sales of fat hogs show a strong demand for top butcher's hogs. To the farmer who desires to make a new start in the hog business and prefers Berkshires the sale announcement of A. B. Humphrey, owner of Grape Wild Farm, Escalon, will be of interest. On Thursday, February 3, he will sell 30 sows and gilts, all of which will be bred to one of their herd boars. No fancy prices are expected and he is willing to accept whatever price the farmer believes he can afford to pay for a good sow or gilt." The sale will be held on the farm, near Escalon, and will start at 1 p. m. Previous to the sale lunch will be served. Col. John A. Davis of Manteca will be the auctioneer.

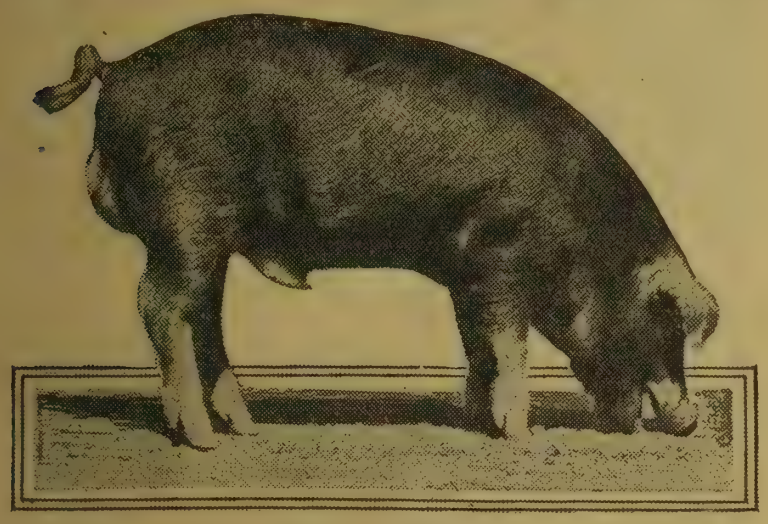
MORRIS COW STILL GOING STRONG

Miss Aaggie Acme Burke, dam of the $41,000 bull, King Korndyke Pontiac Acme, now on test in the Morris herd at Woodland, is just now hitting her stride and has made a notable increase in production for seven days since our announcement in the issue of January 8. As we go to press she has to her credit 35.22 pounds butter from 726.3 pounds milk in seven days, with a possibility of further increase.

CHERRY PATHFINDER

The young Duroc-Jersey boar recently sold by the Diamond Bar Ranch of Spadra to W. P. Hodge, Hinkley, is undoubtedly one of the greatest sons of the champion, Ace of Pathfinders, and made a wonderful record as a show boar last fall, winning first junior boar pig at both Los Angeles Livestock Show and Riverside Fair.

Cherry Pathfinder represents the type modern Duroc breeders are trying to produce. He is high and very straight sided, tall, long, smooth and has a very high arched back. He comes from a remarkable family, four pigs out of his litter winning 16 firsts, two thirds, one junior championship and two reserve championships at Los Angeles, Riverside and Sacramento last fall. The first prize sow out of this show litter will be sold in the Diamond Bar Ranch bred sow sale, February 16, at Spadra, and will undoubtedly prove one of the attractions of the sale.



Cherry Pathfinder

STATE HOLSTEIN ASSOCIATIONS TO SPEND $85,000

Approximately $85,000 will be spent during 1921 by various state Holstein associations in the interests of their members to develop and promote the dairy business in their respective territories.

The national body of the Holstein Friesian Association of America has put the real punch into the state associations during the past year. The idea was conceived about a year and a half ago by R. C. Pollock of the extension service of the national association.

Most state organizations lack only the funds to go ahead and develop within their own boundaries better business methods in improving their herds and disposing of their surplus stock.

Veterinary

Calf Poisoned

Ten months old pure bred bull calf got out of corral and when we got him back in the evening he was blind and lame, digestive troubles set in and he came near dying. Veterinarian was able to cure him of all but the blindness and said that it would soon leave him. But it hasn't, although he eats well and appears well. Is there anything we can do for it? Would it be good policy to use him for breeding purposes next year if he is still blind? —Subscriber, Fallon.

The trouble you mention with your bull calf was probably due to plant poisoning of some kind which caused, as you state, digestive disorders. It is rather difficult to recommend any treatment for correcting the blindness which has resulted, and even though he appears to be normal in other respects I do not think it would be wise to keep him for breeding purposes unless he is a particularly valuable animal. You would probably be better off in the long run to sell him to the butcher and purchase another bull calf of his age, if you desire.

REASONABLE EXPLANATION

"Why is there so much interest in a minimum wage?"

"Dunno," said Uncle Pennywise, "unless it's because so many people are trying to qualify for it."—St. Louis Globe-Democrat.

Have you planned your work so that you can take an invoice of the farm? Start account books and if you have not already done so it would be advisable to get some cooperative insurance on your farm buildings and animals at the earliest opportunity.

BREEDING DATE BOOK--FREE

We have issued a convenient little book for the keeping of breeding dates of cattle, hoping to aid the breeder and cattle owner in maintaining accurate records. We will gladly mail you a copy free if you request it. A postal will do.

Preparing 1920 Farmers

By H. K. Dickson, Local Club Leader, Kern County High School

A FEW days ago one of California's prominent educators was talking to a very practical and successful California farmer. The educator noted the fact that the state average for each crop is far below the yields which our really successful farmers rely on producing. He was lamenting the fact that each year we have a lot of crop failures and bankrupt farmers. "Yes," said the successful farmer, "but I've been looking around this state quite awhile and about the only material I can see to make good, successful farmers out of is our California boys." We believe that the farmer was applying the same principles of "horse sense" to the educational problem that had made him a successful farmer. In other words, if we teach our own boys the fundamental principles of good farming and good business now, we will have a "crop" of successful farmers in 1930.

The Kern County Union High School believes that every willing boy should be given an opportunity to learn all he can about farming while he is in high school. To this end courses are given in general agriculture—dairying, stock judging, beekeeping, farm management, soils and crops. Supplementing this regular work in agriculture is the boys' agricultural club, whose membership is open to any boy in school. This boys' club has grown into a real community factor during the last year. Here is a brief history of its accomplishments.

In the fall of 1919 the boys' club was organized and began work on a "pig litter raising contest." Each boy in the club was to buy a pure bred registered gilt which would farrow a litter of pigs during the winter of 1919. As a club member he must follow instructions, feed and care for his sow and litter correctly, and hand in reports of weights at different ages, amount of feed, cost, etc. Thirty high school boys joined the club and began work.

In a body, the 30 boys and their local club leader visited the Security Trust Company of Bakersfield and talked with the bank officials as to the possibility of their borrowing money to finance each boy in buying a good purebred gilt and furnishing feed for raising his first litter of pigs. Arrangements were made whereby each boy could borrow at least $300 on his personal note without security or the signature of any parent or relative, the only stipulation being that the local club leader endorse each separate check so that both the bank and club leader might be assured that the money was only being spent for club purposes and that the boys might not be overchcarged on any transaction.

During the days which followed the boys borrowed $5,550 from the bank. They made trips to different pure bred hog ranches and hog sales. By November 1, 1919, they had selected from the best herds of California 30 pure bred gilts.

Litters of pigs began coming on during late fall and winter. The boys had a great time comparing notes as to who had the heaviest pigs at different ages and who was making his gains at the lowest cost. As each boy had his own sow at home where he could take care of her himself, and as these 30 boys were scattered over a radius of 25 miles, it was not possible for many of the boys to see all of the other club members' pigs. In order to bridge this gap, and also to tell the people of Kern County what they were doing, the boys' club began publishing a little mimeograph paper known as "Pure Bred Squeals." Six hundred copies of this paper were distributed free of charge to the farmers of Kern County every two weeks.

As the reports of the 30 different litters of pigs came into the club office, it was realized that the accumulated reports contained a great deal of valuable information about raising pigs, particularly so since each boy raised his pigs under just a little different condition from any other club member. In other words, the reports covered the conditions on 30 different farms. These reports were published in a 72 page bulletin which the boys' club called "The Cost of Raising a Pig to Weaning." Fifteen hundred copies of this pamphlet were distributed free of charge to the farmers of Kern County.

To minimize the individual risk on their hogs the boys' club formed its own insurance company, each boy depositing his note for $10 with the club treasurer, and so helping to capitalize the company. Each member was allowed to take out insurance to the extent of three-fourths the value of his sow. During the year two sows were lost, so that by June 1, 1920, the actual insurance cost to each boys' club member was $7.50.

The Kern County Union High School, wishing to back up the boys'

High School Pig Raisers

Upper illustration shows Wm. Bone of the Kern County High School Boys' Agricultural Club and his litter of seven Poland Chinas which averaged 69½ pounds at 70 days. Lower shows Kern County High School Boys' Agricultural Club.

agricultural club in their work, loaned the club $1,000 without interest, which money the boys used to buy their herd boar, The Kern County Pilot, from Mr. McClarnon of Braddyville, Iowa. This nine months old pig was full brother to the 1919 grand champion of the National Swine Show, and came to California as one of the highest priced boars ever owned by a boys' agricultural club. This last fall at the 1920 California state fair, The Kern County Pilot took second place in the Poland China junior yearling boar class, and later was placed first in the same class at the Fresno district fair. He was exhibited by members of the club, and every hog man knows they had reason to be proud of him.

On May 15, 1920, the boys' club conducted the first purebred hog sale ever held in Kern County. This sale turned into a sort of a hog show at which the boys exhibited their stock to a fine assembly of interested growers. The boys served a free lunch to 500 people, and later in the day sold at auction $4,000 worth of stock.

The boys' club accounts up to July 1 of this year showed that the club had sold during the first six months of 1920 approximately $7,000 worth of stock, of which $1,025 was the sum brought in by the sale of boar pigs to hog raisers in Kern County. The prices received for these registered boar pigs ranged from $30 to $75. The sale of these boars has been a big step in the "better sire campaign" of Kern County.

Last fall the boys' club was opened to new members, bought more pure bred gilts ready to farrow, and is raising a better class of pigs than the members had dreamed of doing last year. Their little paper, "Pure Bred Squeals," has increased in circulation to 1,300 and is being distributed free of charge to farmers of Kern County. A new section of the club has been organized for boys interested in horticulture. In this work each boy is to grow 10,000 grape cuttings during the year of 1921.

You ask, "Will not so many boys producing pure bred hogs in one county overdo the industry" or "Isn't the time soon coming when Kern County will be overstocked with pure bred hogs?" The local situation seems to answer these questions best. One purebred hog sale seems to lead to another. The farmers like the boys' club stock. Wherever it has been grown it has proved superior to the general grade or scrub hog. Careful records show that the pure bred barrows raised by the club have made a profit when put in the fattening pen, even under the adverse feeding conditions of last year. The general sentiment of the farmers of Kern County is that they cannot get too many pure bred hogs, and that they are looking to the boys' agricultural club to continue to furnish them with high class breeding stock. In other words, the boys' club has started an industry of its own.

With this experience in cooperation and the careful study and practice of some of these fundamental problems of farming and farm business, we believe that the boys of the Kern County Boys' Agricultural Club are fast preparing themselves to become successful farmers, and the greater number of boys who are educated along these lines, the greater will be the service which we can render to the future farming industry of California.

Hogs Cash Dickey's Barley---at a Profit

By J. P. Bennett

IT is worthy of note that California has the highest pork market in the country at the present time, and with the increased freight rates the packers cannot afford to ship as many hogs from the corn belt feed lots to the Coast as has been the custom in the past, and with the actual supply of hogs in this state at the lowest it has been in years, the farmers of California are assured a good market for their produce for an indefinite time, or until supply overtakes demand, a condition that does not appear imminent.

The unusually high prices were chiefly upon a speculative basis, and the highest prices in the history of the business were recorded. Money was plentiful and easy to borrow, while the value of the dollar was small, and as a result many unsound and unwise investments were made. The greatest mistake made by the swine breeders was in forgetting the real use of the hog—overlooking the fact that the ultimate end of any hog is the pork barrel. True, there are times when it is more profitable to sell the crops for cash and put the hogs on the market, even in an unfinished condition; to suspend pork production until a more profitable time and reduce the size of the herd. However, that practice is not good business at the present time.

As the result of the heavy buying of pure bred animals last winter at abnormal prices, many beginners sustained heavy losses, especially those who were new at the game, and many have thrown up the sponge, cashed their herds for what they could get, and called off all bets. Others, realizing their position, are solving their problem in inaugurating a comparatively new system of maintaining their herds on a purely commercial basis, keeping them strictly pure bred but having the consumption of the bulky crops of the farm and the ready cash of the local market as their primary aim. The acid test of any proposition is, "Will it work out profitably?"

Z. M. Dickey is doing this very thing on his ranch near Dinuba. Mr. Dickey became interested in the pure bred hog business and was one of the heaviest buyers at the pure bred sales last season when prices were at their zenith. He purchased a large number of sows with which to start his pure bred herd and to this foundation he added Giant Bob, the 1919 grand champion boar, at a cost of $5,250. Here he had the nucleus of one of the best herds in the state. Unfortunately, however, his valuable herd boar died within a very short time after his purchase, making a total loss of this investment. When the deflation of prices struck the country, instead of quitting cold, Mr. Dickey worked out an economic plan of production and put his herd on a commercial basis. He kept his best sows for foundation stock and sold the surplus over the scales. A recent visit to the Dickey ranch found over 100 fattening hogs running to self feeders, consuming the barley raised on the ranch at a cash return of around $2 to $2.50 per hundred and bringing in a steady cash income at a good profit. The scales and cost sheets show it has cost Dickey about four and one-half pounds of barley to produce one pound of pork. Figure it out with barley selling at around $1 to $1.25 per hundred. Dickey says his hogs are making the money necessary to pay the expenses of the ranch until his vineyards get old enough to bring in a cash income.

Mr. Dickey is making extensive plans for the coming year. He expects to put in a modern hog plant in every detail to facilitate the handling of a larger herd at a minimum cost of feed and labor. His present plant

INCUBATORS

Closing Out Sale, including P. C. A., Peerless, Old Trusty, Cyphers, Prairie State incubators. Write: Goodacre Poultry Ranch, Compton, California.

THE FIG INSTITUTE

More in sorrow than in anger the fig growers gathered recently in Fresno. It was the fifth annual institute. We think perhaps last year the motions were reversed, for there were at that time so many problems to be thrashed out and so much dissension —or lack of perfect harmony—that many felt the growers themselves were responsible for chaos in the marketing situation. This year there has been a gathering together of many of the producers in a great cooperative marketing association so that the question of marketing has been materially aided. However, the whole marketing situation has so seriously changed that there is no hope of spectacular prices. However, it is believed that reasonably fair prices will be obtained.

The institute, however, was provided with a program which was almost entirely cultural. The first question up was that of varieties, and this portion of the program was made up of "Why I Prefer the —— Fig." The Adriatic was championed by Mr. Minturn; the Calimyrna by Mr. Yokum; the Mission by Mr. Nieman; Kadota, Mr. Beckwith. Then there was discussion of washers, sulphuring houses, by-products, splitting and souring, fig diseases, methods of drying, how to improve dried figs.

And then orchard culture came in for one thorough discussion. Soil moisture, which at the time of the institute promised to be more serious than it now appears, was discussed from various standpoints, the greatest interest, however, being in the necessity of moisture during the fall months because of its relation to fruit bud formation. The discussion of "Planting a Fig Tree" was carried on during the actual work of the planting; likewise pruning, packing in baskets and other attractive containers, and, best of all, at least from the housewives' standpoint, there was a display of figs dried, figs preserved, canned, spiced, pickled, glace and candied, fig bread and cake, fig pudding and fig paste, and even fig candy.

HOGS CASH DICKEY'S BARLEY—

(Continued from Page 121.)

is inadequate to obtain the best results. An old cow barn on the ranch is to be moved and converted into a first class hog house with plenty of space for farrowing pens, feed rooms, etc. This will be placed on a slight knoll with a southern exposure, as Dickey realizes that pasture, sunshine and plenty of room for exercise are essential for the development of the young growing stock. In the future the sows will be more carefully selected, the offspring culled and only a few of the top pigs out of each crop saved for breeding stock. The remainder will go over the scales as fast as they are ready and the whole herd will be maintained in such a way that at any time when the demand for breeding stock is slack the animals can be cashed on the market before they have an opportunity to cause any loss or the herd become overstocked.

At present this ranch is practically the only one in the immediate vicinity producing pork on a commercial basis. Many of his neighbors buy one or two fat hogs to kill for fresh or salt pork. Rarely does a week pass without one or more sales of this sort. The local butcher has found that he can come and pick out six or ten fat hogs a week. Practically all the marketing is done at home without expense or shrinkage due to delivery at the market. As fast as a few of the easiest feeders in the lot are ready to kill, they are picked out, and as a rule by the time these are disposed of, another bunch is ready for the butcher's approval. It is the best and most profitable feeding and marketing system we have seen, and when Dickey gets his new plant in operation he will be in a strong position when it comes to converting his grain into cash and his hogs will enjoy helping him.

What Dickey is doing can be accomplished by others, and with as satisfactory results. The hog is not a get-rich-quick proposition, by any means, but over a five year period no meat animal will produce more revenue for the capital invested.

Consignment Shipments

COOPERATIVE marketing of eggs has so stabilized the market or, perhaps more correctly, has so distributed this product that there has been no glutting of California markets and livable prices have been obtained. This has been made possible because of the large percentage of poultrymen who have realized the power and even the business necessity of this standing together, but it has created a situation which calls for a warning from Chairman Ross of the executive committee of the Poultry Producers of Southern California. This condition of prosperity has induced many others, especially newcomers to California, to enter the business of producing eggs who have not realized the necessity for joining in the cooperative movement. This is throwing a great quantity of eggs on the market without control and it is having a most depressing effect on prices. Giving warning along this line, Mr. Ross writes:

"With a rapidly increasing surplus production of eggs, California faces a serious setback to its poultry industry unless producers realize the basic fact that it is only by united effort on their part that these eggs can be accumulated and graded so that carload shipments can be made to distant markets.

"It is not primarily a question of a greater profit on the eggs so shipped, but the stabilizing of the local market by the ability, through cooperative organization, to send our surplus where it is needed, instead of being obliged to dispose of it locally at such figures as would be obtainable with the supply in excess of the demand.

"In 1919 it was possible for your organization to dispose of most of this surplus f. o. b. Los Angeles (for shipment to other markets), and at prices sufficiently above our local market to make our pool prices reflect this profit. Unfortunately, many of these shipments resulted in a loss to the shippers, owing to a drop in the market while the eggs were en route; hence in 1920 it was found necessary to make these shipments ourselves, the cars going forward on consignment, i. e., billed to New York broker, to be sold on arrival for our account.

"Another feature of this Eastern business (especially all shipments for New York trade) should not be lost sight of, and that is we have to send out a strictly fancy pack if we are to realize the top prices at the selling end. In other words, your management has deemed it unwise to ship out all our best eggs to the ultimate detriment of our home business.

"Practically all these consignment cars are forwarded by express, but even that means seven or more days en route, so that we have to take the risk of fluctuations in the market, and while a few of these may be very slightly upward, the reverse is usually the case and all the spectacular drops have been downward, the New York market having been known to drop as much as 22 cents in a single week.

"This will show you that all consignment shipments are more or less speculative and are only resorted to in our endeavor to stabilize our local market conditions when we are unable to store our surplus and must resort to foreign markets to move it. In fact, taking figures which the writer happens to have at hand, for the first 13 cars shipped out, we show a loss on six cars and a gain on seven.

"Actual figures on consignment car No. 11, shipped out November 20, are:

"Car shipped to New York in American Railway Express refrigerator car No. 221—422 cases candled fresh extras at 88 cents, $11,140.80; paid express, $1,332.80; paid commission for selling, $422; paid cartage in New York, $35.87; total, $12,931.47.

Sold 12,660 dozen at $1.03 (this was the highest price received for any car sold), $13,039.80; less cost as above, $12,931.47; net gain on this car, $108.33."

The annual meeting of the Poultry Producers of Southern California will be held Friday, January 28, at 10 a. m., and Mr. Ross writes:

"You owe it to yourself, as well as to your fellow members, to be present and take part in the transaction of your business. Don't leave it to the other fellow."

STORRS EGG LAYING CONTEST

Storrs, Connecticut, December 27, 1920. Report for the eighth week, ending December 26, 1920.

In the eighth week of the laying contest at Storrs, Rhode Island Reds occupied the front of the stage. A pen owned by Charles H. Lane, Southboro, Massachusetts, was an easy first with the splendid production of 54 eggs, a yield of nearly 78 per cent as compared with the general average of 25 per cent for all pens.

All poultry flocks are now expected to gain in egg yield more or less steadily and rapidly from this time on to the zenith of production, which comes along in May. The weekly gain in the laying contest has not, however, been as rapid as in some years. On the other hand, the management has been somewhat different in that the incoming pullets were not forced for egg production from the very start. At one time this seemed to be generally accepted as the best scheme, but lately it has come to be believed that in the long run more eggs can be obtained from any given flock of hens, not by forcing them too early, but by waiting until the pullets become more physically fit. All this is accomplished by feeding grain liberally for the first few weeks instead of forcing the birds to eat a lot of mash. During the month of November the pullets in the contest consumed an average of four pounds of grain for each bird, but only a little more than two pounds of mash, whereas it is a virtual certainty that next May when in heavy production these figures will be reversed, and then read two to three pounds of grain and four or five pounds of mash.

The four leading pens in each of the principal varieties are as follows:

Plymouth Rocks

W. H. B. Kent (Barred), 233 eggs; Rock Rose Farm (Barred), 138; F. R. Pember (White), 134; Ernest W. Picker (Barred), 130.

Rhode Island Reds

Old Town Farm, 301 eggs; H. S. Bickford, 247; F. S. Chapin, 243; F. H. Sampson, 233.

White Leghorns

Lion Head Poultry Farm, 222 eggs; L. E. Ingoldsby, 219; E. A. Ballard, 213; Max Axlerod, 212.

Other Varieties

Obed G Knight (White Wyandotte), 304 eggs; Clemens J. Diemand (White Wyandotte), 151; H. P. Cloyes (Buff Wyandotte), 133; Harry D. Emmons (White Wyandotte), 91.

CLOSER COOPERATION

The poultry business has proven wonderfully attractive in California, and not only in California but in other sections of the country, notably on all the Pacific Coast. This calls forth appreciation of the fact that competition enters into the poultryman's business as well as some others. Touching upon this point, Cornele G. Ross of the Poultry Producers of Southern California has written a circular letter to members of that association, in which he says:

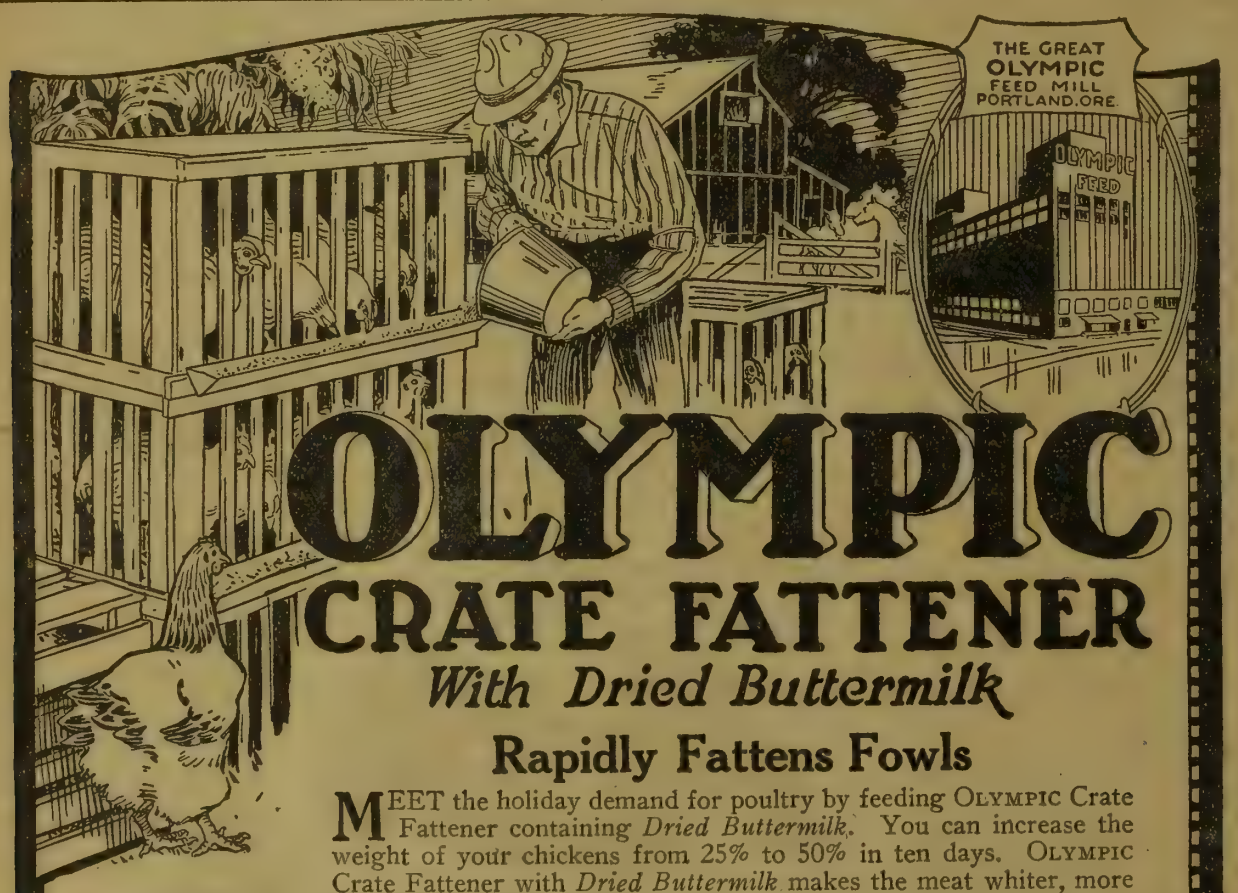
"Western Washington reports over 1,000,000 baby chicks hatched in 1920, with more promised for the coming season. We quote from the Seattle Produce News:

" 'For the second time this season, and also the second time in the history of the poultry industry in the state of Washington, a solid express train of fresh eggs was sent out of Seattle to New York, on December 24. The special train consisted of five carloads. Three were packed in Seattle, one in Winlock and one in Tacoma. The first special of four cars was shipped from here in the early part of December.'

"This shows that our Washington brothers are hustlers, and if we are to stay in the game we shall have to keep our organization intact and right up to the mark every minute. This means loyalty on the part of every member and more interest taken by all in getting new members that we may be in better shape to stabilize our local market during the peak season, as well as reduce our operating cost through greatly increased receipts."

Meetings with poultry producers are being held this week at Gardena, Van Nuys, Riverside, San Diego, and another will be held at Pomona on Monday of next week. Especial inducements to attend that meeting are shown by this portion of the notice sent out:

The Los Angeles County farm bureau and the Pomona Valley Poultry Breeders Association have arranged



OLYMPIC
CRATE FATTENER
With Dried Buttermilk

Rapidly Fattens Fowls

MEET the holiday demand for poultry by feeding OLYMPIC Crate Fattener containing *Dried Buttermilk*. You can increase the weight of your chickens from 25% to 50% in ten days. OLYMPIC Crate Fattener with *Dried Buttermilk* makes the meat whiter, more tender and sweeter flavored, breaking down the tough sinews and muscle tissue. You can command better prices per pound and bigger profits per bird.

Dried Buttermilk

The OLYMPIC Dried Buttermilk Process simply removes the 90 to 92 per cent of water, leaving the milk elements in highly concentrated form, pure and fresh for shipment, storage and feeding.

This is mixed in proper proportions with the other ingredients in OLYMPIC Dried Buttermilk Feeds.

A Test of Taste

An OLYMPIC crate-fattened chicken dinner, served simultaneously at three great Portland hotels, brought the following expressions of satisfaction:

"OLYMPIC crate fattened chickens are more tender and better flavored."—*Hotel Portland.*

"Every piece of the poultry measured up to as high a standard as the hotel could wish."—*Hotel Benson.*

"The dinner was served 300 guests and complimented by all."—*Multnomah Hotel.*

A Test of Weight

The following results were obtained by the Hazelwood Company, of Portland, a concern shipping 10,000 birds a week:

92 White Leghorns fed *100 lbs.* OLYMPIC Crate Fattener with *Dried Buttermilk*, gained a total of *40¾ lbs.*

92 White Leghorns fed *181 lbs.* mixture of corn, oats and barley feed with *semi-solid* buttermilk gained but 32.3 lbs. in the same time, or on a 100 lb. basis, *but 17.7 lbs.*

Five Crankshaft Bearings

The motor used in the "Caterpillar" Tractor has five main bearings. Rigid bearing support on each side of each crank-pin eliminates excessive vibration, provides the proper foundation for a heavy-duty motor, insures longer bearing life and service. This is one of many features of Holt design that make the "Caterpillar" Motor stand supreme in service, power and low upkeep cost.

GERMOZONE

"the Best Remedy for Poultry and Pet Stock"

The old reliable, proven remedy for Roup, Colds, Canker, Swelled Head, Bowel Trouble, Snuffles, Wounds, Sores, Loss of Fur or Feathers, Skin Disease, Etc.

H. A. Kiewert, 5042 N. Long Ave., Chicago, Ill., says: "I had some of the worst kind of cases of roup in my chickens and I thought I would not save any but I have saved these birds, thanks to Germozone." H. A. Haines, Rosalia, Kas.: "If we had tried Germozone at first it would have saved us $1,000 worth of expensive experiments." Mrs. T. A. Morley, Galien, Mich.: "Have used Germozone 17 years and could not get along without it." E. W. Thiel, Waukesha, Wis.: "I have used your Germozone for white diarrhoea in baby chicks and sure got wonderful results. I also use it right along on grown fowls."

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages, from Omaha. Poultry Book and Book on Diseases FREE.

for an exhibit of stereopticon slides of the laying houses at Santa Cruz, also at Petaluma, where two laying contests are now being conducted. This exhibition will be given at the Pomona high school auditorium on Tuesday evening, January 18, at 7:30 p. m. R. B. Easson will have charge of the meeting and will explain the pictures as well as give figures on the 1920 laying contest. All poultrymen and poultrywomen are invited.

Poultry Queries

Conducted by J. A. Koethen

Scaly Leg on Turkeys

I have several turkey hens that have a scaly or rough growth on their legs just below the knees. I rather think it is caused by roosting on the ground. Can you suggest a cure?—Subscriber, Water.

The growth is probably the scaly leg of chickens. It is due to filthy yards and houses, but is also contagious. If your turkeys have been roosting on filthy ground or ground previously contaminated by chickens, the explanation is easy. Rubbing the scale well with a mixture of lard and sulphur, half and half, will probably remove it. The treatment will have to be repeated several times, a day or so apart. If this treatment does not have the desired effect, try oil of caraway mixed into an ointment with white vaseline, 1 part oil of caraway to 5 parts vaseline. Equal parts vaseline and zinc ointment is also recommended. Treatment must be continued at intervals of a few days till all signs of the disease have disappeared.

WHAT STRAIN OF BEES?

By G. W. Bercaw

Just exactly what strain of bees one chooses depends mostly upon individual tastes. Our native honey bees have some good qualities. In the production of comb honey in our own yards we have found that our native black bee, sometimes called the German bee, produces and caps the whitest and clearest comb honey, but this might not be the experience of others in all instances. I might add to this that these black bees are probably the crossest and much inclined to sting either a trespasser or a beekeeper. For an all around, good, reliable, gentle bee we have found the Leather Colored or Three Banded Italian the best for storing honey, if properly handled. There is a strain, commonly called Golden Italian, which are fine looking, but for the production of honey I have not found them satisfactory. An imported queen bee is not handsome. However, the gentleness and strain are much more to be desired than color, and if a person can get good stock from Italy, crossing them with our native Italian drones, there is no better strain, all things considered. Importing queen bees from foreign countries is a risky proposition. We have had consignments of 12 queens from Milan, Italy, arrive with all attendant bees dead and only about six queens alive. Queens seem to stand the trip better than their attendants. It is acknowledged by nearly all prominent beekeepers that a good strain of Italian bees is the best resistant stock and much less liable to the attack of our commonly called foul brood. Just why this is has not been definitely solved. It may be that good Italian bees are the better housekeepers, and most of us know that good housekeepers are difficult to find.

Kansas will use the California state land settlement act as a model for a system of land colonies similar to those in this state. This was determined at a meeting last week at Topeka at which Dr. Elwood Mead, professor of rural institutions in the University of California, outlined the California plan before a representative conference.

Honey production has increased greatly in the Sacramento Valley during the past ten years. Alfalfa sections especially have proved attractive to the bees.

12,000 Miles

GUARANTEED
Without Punctures or Blowouts

They can't puncture—They can't blow out.

No pumping or patching or roadside repairs.

Ford, Maxwell and Chevrolet owners are getting 10,000, 15,000 and 20,000 miles of wear, in all kinds of service—on passenger cars and trucks—under all kinds of driving conditions.

Nothing can happen to Dayton Airless Tires but w-e-a-r. Nothing stops them until they are worn clear down to the last pier of rubber. Remember — without punctures or blow-outs.

Do you use 30 x 3, 30 x 3½, 31 x 4 tires? If you do, spend your money wisely — buy Dayton Airless. It's true economy.

The next time you drive around our way, STOP—AND LOOK THEM OVER.

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

Immediate delivery can be had on

Pioneer Incubators

in 540, 270, 135, 110 and 72 egg sizes, either electric, gas or coal oil machines; these are absolutely the best incubators made and when better ones are manufactured we will handle them.

Also fireless brooders in 100, 50 and 25 chick sizes. Pioneer hot water brooders in 200 and 100 chick sizes. Kresky brooder stoves. 500 to 1,500 chick sizes. "Chick-Elec" Electric hovers. 150 to 600 chick sizes. Reliable Blue Flame Hovers, 100 to 500 chick sizes. Cycle Hatchers, the best 50-egg incubator on the market. Poultry supplies, remedies, feeds, etc., always on hand.

We can supply baby chicks in any quantity and can handle single orders in 5,000 lots of R. I. Reds, Barred Rocks, White Leghorns, Brown Leghorns and Anconas, and we will have a limited supply of Black Minorcas, White Minorcas, White Rocks, White Wyandottes, Indian Runner Ducklings and Mammoth Bronze Turkeys.

All our chicks are hatched from selected eggs supplied from thoroughbred flocks owned by experienced breeders who have been connected with us since we first started in business fifteen years ago. Send to Department A for price lists and catalogs and place your order soon to avoid disappointment on delivery. Finest incubator, brooder and baby chicks display in the city. Visitors welcome at all times.

The Wonderful Attractions of BRITISH COLUMBIA

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the Coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now, is the time to

Learn about this wonderful Province and share in its possibilities. It's industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success. For illustrated literature, maps, etc., write Department of Immigration, Ottawa, Can., or

Gilbert Roche.

HAY

Alfalfa Growers of California under date of January 19:
There were 775 tons received in San Francisco the week ending January 15.
No. 1 Dairy Alfalfa.....21.00
Standard 19.00
Under date of January 17, A. W. Scott Co. says:
Receipts of hay for the past week, 775 tons. The past week has shown more activity in the handling of hay, both in San Francisco and throughout the state, than for some weeks. In fact, it is the result of a general sentiment manifest in all lines of business. Both consumers and producers seem to have squared back their shoulders, tightened up their belts and made up their minds that they are going to take their medicine and do business. The consumer seems to feel that values have now reached levels low enough to inspire his confidence, while the producer also has become apparently convinced that a reaction is unlikely and nothing will be gained by holding longer. As the minds of the two elements of business thus apparently approach a meeting, trading results and business will probably be increasingly active from now on.
We quote today wholesale prices in carload lots as appear from dealers' transactions upon the hay market in San Francisco (for prices to consumers charge of cartage, commission and handling expenses must be added, according to conditions).

Wheat Hay, Fancy	20.00@21.00
Wheat Hay, light 5 wire bales	17.00@19.00
Tame Oat Hay, fair to choice	17.00@19.00

Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00

Citrus Markets

Los Angeles, January 19, 1921.
Prices are firm and fairly satisfactory in nearly all markets. The immense amount of small fruit is inducing heavy cutting of small offs. There is but little f. o. b. buying. No injury is the report from all orange districts affected by the recent cold.
The lemon market remains flat, though slightly better feeling prevails. There are practically no foreigns on the market.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 2,873 cars; lemons, 1,012; total 4,885. To same date last season: Oranges, 4,794; lemons, 799; total, 5,593. From Central California to date, this season: Oranges, 3,890; lemons, 50; total, 3,940. To same date last season: Oranges, 3,381; lemons, 140; total, 3,521. From Northern California to date this season: Oranges, 297; lemons, 3; total, 300. To same date last season: Oranges, 260; lemons, 20; total, 280.

HOG WALLOWS

I was much interested in Mr. Whitney's article on hog wallows. He has surely been close to this particular soil and knows whereof he speaks. I think he has effectively disposed of the bush, wind and dirt theory. Now I would like to ask who has ever seen tules growing in this particular soil? I never have, and I have seen thousands of acres in California and Oregon. Invariably they grow in silt, and their whole lifework is leveling and building up.

No respectable tule would be satisfied with a little 20 foot hog hummock. They are a slow plant to start, and then only under the most favorable conditions; but once they do start they never let go until long after they are dead, and lack of water is about the only thing that will kill them. Dozens of plants grow from a single root, which may be 50 to 100 feet long, crossed by other roots until a network is formed upon which one can walk in safety, while underneath may be 20 feet of slime and ooze.

The first time I saw the hog wallows of Tulare County they reminded me of the home of my youth, and I am taking the liberty of advancing the theory that occurred to me at that time. In the light, deep soil along the creeks and rivers are many grand old oaks, and the ground under them is smooth as a lawn. In many places where the oaks cease the hog wallows commence. Is it unreasonable that many years ago there should have been oaks where there are none now?

Many years ago a fire in Maine and New Brunswick swept a good part of that state and province. Before the roots had rotted heavy rains loosened the soil and a high wind leveled the forest, and the roots lifted great quantities of dirt and small stones. And there today, in all but the lightest soils, are hummocks and hollows in miniature of the hog wallows of Tulare County. Those knolls are five to ten feet across, but after all these years during which generations of timber have grown and been cut for the market, the little wallows still wallow and the little hummocks still stand. The knolls of Tulare are 20 to 30 feet across, and if one of our giant oaks uprooted what would you have?

And, again, is it unreasonable that during some season of extreme wet that a high wind swept through the valley, and while the deep rooted tree still stands, his brother on the heavier soil with his mighty weight of leaf and branch and shallower root system should be uprooted and help to form the noted hog wallows of Tulare County.

A woman tourist inquired of the San Diego ticket office man when the 5:15 train would leave.
"A quarter after 5," he replied politely.
"My goodness!" she exclaimed. "I never can get accustomed to Pacific Coast time."

Establish a reputation for honest, uniform, high grade products, and then live up to your brand.

SCRAPERS TO FIT CALIFORNIA

Californians have always demanded something "different." Years ago wagon manufacturers sent the old time eastern box wagon here and found it was not received with favor. They learned California's requirements, and practically every Eastern manufacturer sent carloads of "California" wagons. They are even quicker today to meet the conditions. As an example, the Miskin Scraper Works at Uncin, Idaho, manufactured a scraper which fitted Idaho conditions to a T. It was a horse drawn implement and so successful that shipments made to California were well received, but still were lacking in the eyes of the tractor farmer. Regarding the situation the company writes:
"We began sending our horse drawn scrapers into California last summer but soon ran up against the proposition that most of the farmers in that section of country use tractors instead of horses for their farm work. They were very anxious to get a suitable tractor scraper so that the driver could operate the scraper as well as the tractor, which we have succeeded in doing, though not until after a long and severe strugle, so that now the tractor will carry the front end of the scraper and the scraper wheels carry the rear end of the scraper, loaded or empty. It is very easily operated from the tractor seat. It is already in great demand in California."

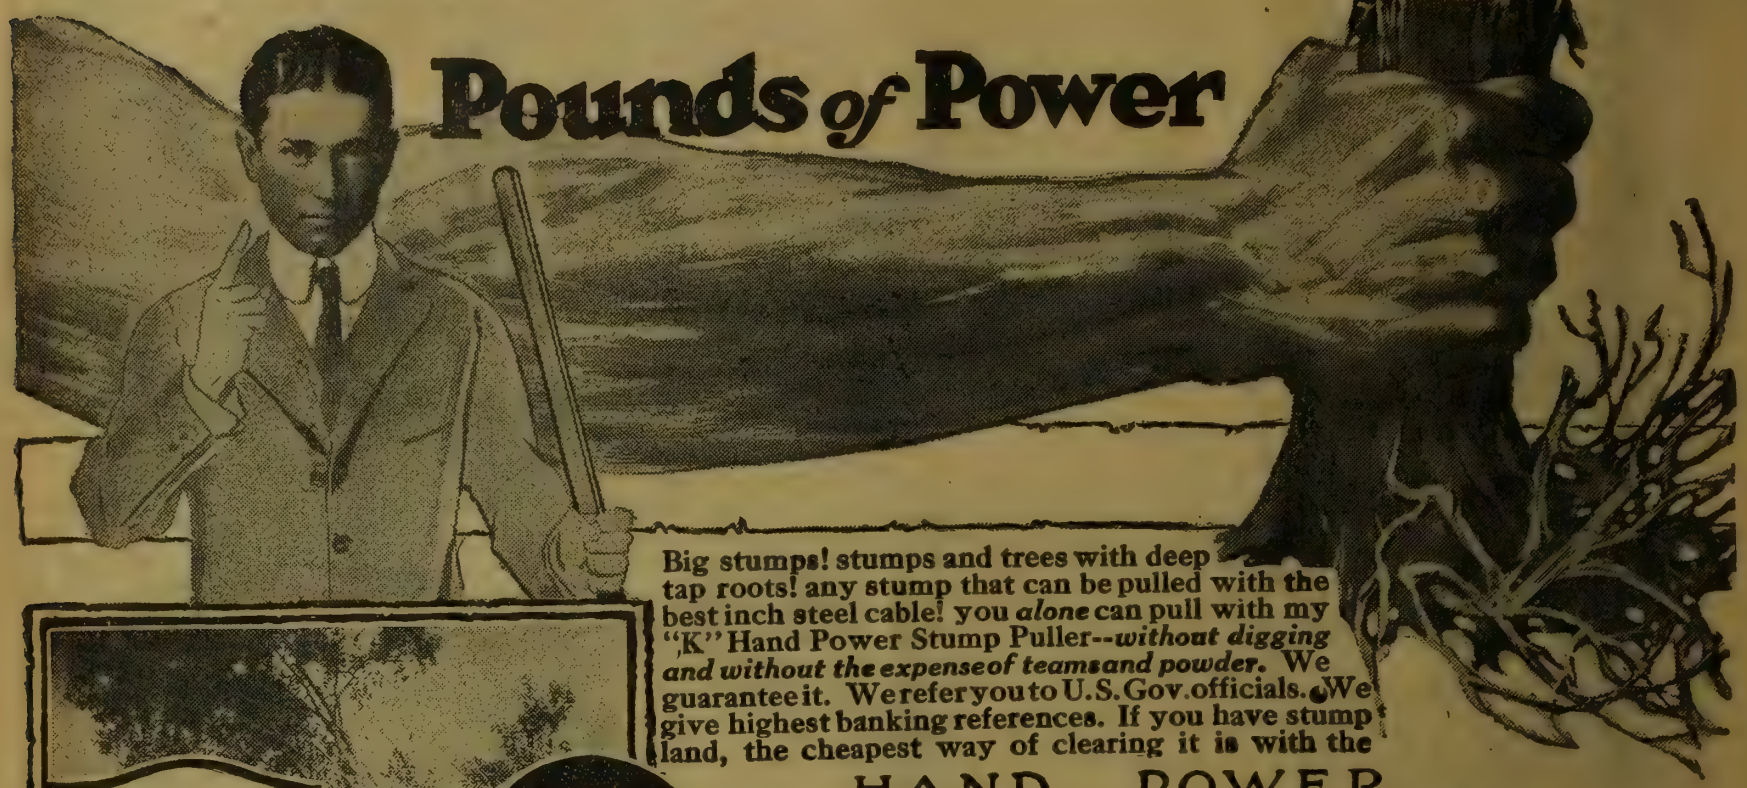
The K Hand Stump Puller

Gives Your Hand 96,000 Pounds of Power



Big stumps! stumps and trees with deep tap roots! any stump that can be pulled with the best inch steel cable! you *alone* can pull with my "K" Hand Power Stump Puller--*without digging and without the expense of teams and powder.* We guarantee it. We refer you to U.S. Gov. officials. We give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER

K Stump Puller

Frank Hance, a *one-armed* farmer of Bowie, Md., pulling double silver maple 3 ft. 8 in. in diameter at the ground, with deep tap roots. This is an easy pull for the "K" as the cable can be hitched high and the leverage is consequently greater.

How the "K" Pulls Biggest Stumps

The "K" works on the leverage principle of the ordinary lifting jack, except that the power is applied on a cog-wheel instead of a standard. 100 lbs. push on the lever develops a 48-ton pull on the stump—all an inch steel cable will hold. One man operates it alone—no teams to pay for—no walking.

A Mechanical Wonder

Made of finest steel—guaranteed against breakage. Weighs only 171 lbs.—easily carried or hauled about on its own wheels. Has two speeds—60 feet per minute for hauling in cable or for small stumps—slow speed for heavy pulls. *Works equally well on hillsides and marshes where horses cannot work.*

Owners Praise It

H. Sinclair of the Dept. of the Interior, a U. S. Gov. official, writes: "The stump puller is a wonder."

Ernest Thompson Seton, author and naturalist, declares the "K" "a great success."

Hundreds of owners write in, telling of pulling six- and seven-foot stumps, of pulling faster and pulling bigger stumps than by any other machine.

Special Offer We are making a special offer to get a "K" Stump Puller introduced in every neighborhood. Write us today for full information and for free book on Land Clearing and about our Wonderful Drag Saw.

The Fitzpatrick Products Corp.
Box 17
99 John St., New York

Let Spraying Save Your Fruit

Your Hogs, Garden and Poultry

EVERY Fruit Grower and Farmer should look out for destructive pests this year. Government bulletins say their work of destruction is more terrible than ever before in some sections. Experts estimate that the loss will total millions of dollars.

Send the coupon and find out now, how spraying will save your part of this enormous loss; how spraying will save your fruit and every other living thing on your place.

Our new FREE Book tells also how Fruit-Fog, the scientific, vaporous, super-spray, works into the microscopic niches in bark, buds and foliage, where no ordinary coarse spray can possibly reach. It explains why ONLY by thus doing a **thorough** job—only by seeking out and killing these **hidden** pests—are big crops possible.

When you understand this wonderful advantage, you will KNOW why Fruit-Fogged orchards and farms are producing amazing yields. Also why Fruit-Fog is acknowledged a phenomenal success.

Fruit-Fog is produced by Hayes 300-lb. high pressure and the famous Hayes nozzle. It envelops everything like a mist. Its vapory fineness gives wonderful adhering power. No drops form—no solution wasted—no buds or leaves knocked off—as with heavy, lower pressure sprays.

Hayes Sprayers are scientifically made to give enduring service and greatest efficiency under high pressure. The famous Fairbanks-Morse "Z" engine insures reliable engine service.

Send Coupon Today

Tell us how many trees you want to spray, and how old they are on the average, also what other uses you have for your sprayer. We will tell you where and how you can get the style Hayes Sprayer best suited to your needs, and its price. We will also send our big New Book of Hayes Sprayers, and valuable Spraying Guide FREE. Send the coupon today.

HAYES PUMP AND PLANTER COMPANY
Dept. D GALVA, ILL.

Hayes Sprayers For All Purposes

Whether for spraying orchards or gardens, for disinfecting hogs or poultry, for whitewashing or cold water painting or any of a hundred other purposes, there is a Hayes Outfit to exactly meet your needs.

Fairbanks - Morse & Co.

Distribute Hayes Power Sprayers, Engines and Repairs. Users of Hayes Power Sprayers are therefore, within only 24 hours of a service station at all times. In case of accident at a critical time, this quick service may save your fruit crop. Hayes Hand Sprayers are distributed by Hardware and Implement jobbers.

California Cultivator

Vol. LVI, No. 5 **Los Angeles, January 29, 1921** **One Dollar Yearly**

Arizona Boll Weevil

By Chas. T. Vorhies

Shall wild cotton be eradicated from Arizona's hills and with it will it be possible to eradicate the Western cotton weevil? This question would be serious enough in its financial phase, but it is also somewhat complicated by contention between the federal and Arizona authorities on one side and A. W. Morrill, formerly entomologist of Arizona, on the other. Dr. Morrill is now connected with cotton interests which take issue with authorities of Arizona, as he explained in an article appearing on Page 5 of the issue of the California Cultivator of January 1. Those who believe the Arizona authorities and department men are acting wisely and doing their utmost to control a pest which, as yet, is not serious, but from which much is feared, have since the publication of the article called at the office, and we now have a letter from Dean D. W. Working of the Arizona agricultural experiment station, in which he refers to Dr. Morrill's connection with the board of agriculture and horticulture at the time the present line of work was initiated and to the fact that his association joined in requesting the federal horticultural board to make an effort to study the Arizona situation and plan a campaign of eradication. Dr. Working encloses with his letter one which he has received from Entomologist Chas. W. Vorhies.

MR. MORRIL states that the wild cotton weevil "is probably more to be feared than the Eastern variety." This is purely a matter of opinion not yet proven by experiment, and on this point the opinion of Mr. Coad, the government authority who carried on the experiments at Agua Caliente ranch, east of Tucson, is doubtless as good as any other. He says in his report on this weevil: "Its present habits are such that it would not injure cotton greatly, but these habits will probably be changed to a certain extent and more injurious ones acquired." Without wishing to minimize in the least the possible danger, it is only fair to point out that no one knows the extent of this danger sufficiently to make a valid argument that it is "more to be feared." Mr. Coad further says: "The present habits render it quite probable that the control of the Arizona form will be a very different problem from that of the cotton weevil and more easily solved." Apparently the world is not on fire because an infestation has been found.

Unfortunately for the argument regarding the danger of forcing an infestation of cotton by such destruction of wild cotton as was carried out in the fall of 1919, there are several facts which tend to nullify it. The plants which were destroyed at that time were an insignificant fraction of the whole number of wild cotton plants in the adjoining ranges, quite insufficient to cause any great "food shortage" and consequent migration in numbers. I would estimate that much less than one per cent of the total plants were destroyed, only the fringe of scattering plants along the washes between the mountains proper and the valleys where cotton could be grown being cleaned out. These are precisely the plants referred to in Coad's report, as follows: "In this connection the distribution of the plants through the lower arroyos is especially important. In many localities these now support weevils and so are a constant menace to cotton, while even where the weevils are not now present they are always likely to serve as stepping stones in the downward movement of the weevils maintained by floods." It was only these "stepping stones" plants which the Arizona authorities eradicated, or attempted to eradicate. As a matter of fact, the plants outside of the canyons have during the last two years had a lighter infestation of weevils than those farther up in the mountains, and less than apparently was the case in some earlier years when others were making observations. This is a fact determined by my personal observation.

Regarding the forcing of an infestation of weevils by means of the eradication work, there was not known to me or to the commission or the state entomologist a single acre of cotton growing in the danger zone of the upper Rillito Valley in the season of 1919, so that the danger of causing an infestation at the late date of October 13 or 14 was but little; while as a matter of further fact, a killing frost occurred in a few days after the inauguration of the work, further safeguarding against forcing adult weevils to flight. The oncoming generation of weevils, such as may have been present, was certainly destroyed by the burning of the plants after pulling. In this connection, also, it is of much interest to know that precisely the condition held desirable by Dr. Morrill, namely, the leaving of roots of plants to grow and act as trap plants the next season, occurred in most if not all of the washes or arroyos where work was done. These in most cases produced a crop of bolls in the following season of 1920, and in these we should expect to find, if the trap plant theory works out so importantly in practice, a large number of weevils and also a large number showing the work of the boll worms. According to Morrill the boll worm moths must otherwise have infested cultivated cotton. Neither of the above events has transpired. As a matter of actual fact, I have opened and examined every discoverable boll on these left over trap plants in two washes and have not found a single weevil. Only one boll was found which had been eaten out by the boll worm, and this was at the canyon mouth, near undisturbed wild cotton and four miles from the nearest cotton field.

True enough, some weevil infestations of cotton have been found in the danger zone of the upper Rillito Valley, and I must believe that these infestations would have occurred under Dr. Morrill's plan of protection, as they have occurred under the other plan. I now believe, as a result of my observations of the past season, that the only safe thing to have done last year would have been to have established a wide and strict non-cotton zone such as has already been established for the coming year, and this Dr. Morrill does not claim he would have done. No one knows better than he the practical difficulties in the way of establishing such a non-cotton zone when the price of cotton is high and every farmer wants to try the crop. With the cotton market as it is today this will be a relatively easy precaution to carry out.

I wish to state that I know from cage experiments begun last fall on this potential pest that it is much easier to detect an infestation by the boll worm than a weevil infestation, and I therefore believe that no such infestation has occurred. The close inspection necessary to detect what has been found of weevil infestation would inevitably, in my judgment, have led to discovery of the boll worm, if present. A boll infested with a boll worm of the species to which Dr. Morrill has referred can be readily detected from outside examination only; in fact, if the worm be of fair size the boll is likely to be rendered conspicuous. On the other hand, a boll infested with weevil larva must be opened to be certain of determining the presence of a larva. The above facts concerning the appearance of a boll of cultivated cotton infested with boll worms of the species under discussion are doubtless unknown to Dr. Morrill, as they are the results of my own experimental work of last September.

There is another point which, as a direct result of my personal studies and observations in the past two or three years, I consider of great importance. Dr. Morrill makes much of the possibilities of distribution of weevils to the cotton fields by floods, following up in this respect the suggestions rather strongly urged by Coad in his bulletins. I am becoming more and more convinced, on the other hand, that this means of distribution, while a possibility, is not very probable. My reasons for this view are as follows: It appears to me that the great majority of the bolls remain rather firmly attached to the parent plants until a year and even more has passed. During this time nearly or quite all of the uninfested seeds have shaken or rattled out, allowing plenty of opportunity for the seeds to be carried away by floods, but not so the bolls. Further, a considerable number, which I believe to be the majority, and possibly nearly all, of the infested bolls not only remain on the plants, but they fail to open up sufficiently to allow of the discharge of the several glued together seeds which constitute the hibernation cell of the weevil. Consequently the supposed danger of carriage of infested bolls by floods I believe to be greatly minimized if not almost wholly negligible. I no longer believe that the distribution of seeds by floods, as indicated by the appearance of seedlings far down the washes and stream beds, is at all coincident with the probable distribution of weevils by floods. As this conclusion has grown upon me I have mentioned it to others in advance of the past season, which as I now see it offers some proof for it in a negative way. That is, we have seen this season an infestation similar to that observed by Coad at Agua Caliente Ranch, but without the floods to account for it. The 1920 season was unexpectedly dry in July and August when floods are usual, and no floods from the Catalinas reached the Rillito and the ranches where infestations occurred. From observations on the wild cotton in August and September, I learned that the blossoming season was abnormally delayed, probably mostly by lack of mosture, and the weevils had not even buds (squares) on which to oviposit until an unusually late date, and of course they had no bolls, which they prefer, until a later date. In fact, there were no bolls formed until the month of September, it being a very rare exception when a blossom opened before August 31. It is my belief that this condition caused a flight of adult weevils which would not otherwise have occurred, resulting in the infestation of cotton fields.

Dr. Morrill says: "No effort should be spared to completely eradicate the wild cotton boll weevil in Arizona." Personally I have steadily maintained, and am more firmly of the belief than ever, that to attempt this would be a great waste of money. The cost of eradication of the plant alone without any precautions as to the insects harbored would be prohibitive, and when there is added to that the increased cost which would be necessary if proper precautions were taken for eradication of the insects it becomes entirely out of the question to attempt it. The entire cotton crop of the Santa Cruz and Rillito valleys for many years would not pay this cost.

TRACTOR AND IMPLEMENT ASSOCIATIONS

On the Pacific Coast there are four separate power farming and implement associations. They are the Northwest Power Farming Association of Spokane, the Portland Tractor and Implement Association, Portland, Oregon; the Traction Engine and Implement Dealers Association, Los Angeles, and the California Tractor and Implement Association, San Francisco. These four associations united and organized the Pacific Coast Tractor Associations early in 1920. Members of this coast association have now made arrangements by which there will be affiliation, even closest cooperation, with the National Implement and Vehicle Association, a large national association which has had more to do with advancing power farming than any other.

At the recent convention of N. I. & V. A. held at Atlantic City, the Coast was represented by President Gardner, Thomas Osborne of Los Angeles and George Collins of San Francisco.

Regarding the Eastern convention and the courtesies accorded the Coast representatives, Mr. Collins writes:

"After expressing extremely cordial sentiments at the interest of the coast associations in being present at the convention, stated their desire to cooperate with the Coast in the fullest manner and afford every facility within their power and that of the committee in helping to solve these problems, carefully explained the inability of the N. I. & V. A., under its present bylaws, to federate any association with it, and suggested that we accept the invitation of President Gittins to be present at this meeting.

"Representatives of the coast associations are mindful of the extreme courtesy that was extended them, both in a social way and in line with the object of their visit here, which courtesy was often at the expense of a personal sacrifice on the part of the men who so graciously received them. Since the convention at Atlantic City the utmost in cooperation and assistance has been given to the coast associations by your secretary, H. J. Sameit, and by his assistant, Robert A. Jones."

Agricultural News Notes of the Pacific Coast

Northern California

Orland and Chico are discussing grain elevator.

San Francisco recently shipped 11,980 dozen eggs to Hawaii.

The Sutter Basin will plant over 1,800 acres of spring vegetables.

The Sacramento chamber of commerce now has a home of its own.

A prune grower at Chico has found market for his prunes at Denver, Colorado.

Northern prune producing counties are generally signing up the new contract.

More than 5,000 pigeons were shown at the recent Oakland national pigeon show.

Alameda County farm bureau is finding success in its 1921 membership drive.

The state engineer has disapproved of plans of the Honcut-Yuba irrigation district.

Tehama County is now in the oil game, new wells being sunk almost every day.

Butte County reports rice acreage not harvested because of storms will show at least 30 per cent loss.

The Contra Costa County Farmers Association has completed purchase of land for elevator and salesroom.

The Lake County Pear Growers Association recently held its monthly social meeting at Finley schoolhouse.

Bulk handling of grain received great impulse by the successful work of the few elevators constructed last year.

The Farm Bureau Elevator Corporation is planning the erection of five grain elevators at Davis, Woodland, Zamora, Yolo and Dunning.

Director Dunlap is having success in his drive for membership in the Prune and Apricot Association. Butte County reports many growers already signed.

The state farm bureau federation is pushing for a measure which provides appropriation of $50,000, preliminary expense in carrying out the California warehouse act.

President Stephens of the Pacific Rice Growers Association is urging members to discontinue harvesting efforts, maintaining that spring time will see the work more successfully done.

Placerville, Eldorado County, Fruit Growers Exchange in annual meeting reported that association shipped last season 166 cars fresh fruit. One hundred sixteen members attended the banquet.

The Iron Canyon survey findings indicate cost of the project as $37,577,000. It is estimated that 225,000 acres of Sacramento Valley land would be irrigated when this great work is completed.

Celery growers of the delta of the Sacramento River announce they will turn their gardens into hog ranches unless there can be a reduction in freight rates on celery. Sacramento grew 6,000 acres of celery this last year.

The Humboldt County farm bureau is making a special membership drive. A big year's work is blocked out, direction of which has been placed in the hands of ten standing committees, on livestock and dairying, on poultry raising, purchasing and marketing, etc.

Central California

The Hickman-Waterford farm center netted $450 from annual dance.

Barley growers are discussing what to do with their light weight barley.

Farm Adviser Smyth of Madera County has tendered his resignation.

Valencia, Santa Cruz County, is organizing a center of the farm bureau.

Fresno is making an effort to secure a branch of the state university in that city.

Fresno County farm bureau's membership campaign netted 100 per cent gain.

Almond growers are contemplating making direct sales of almonds to retailers.

Milk Producers of Central California recently met at Modesto to elect board of directors.

Duroc swine breeders of Stanislaus County held their regular January sale at Modesto fair grounds.

Watsonville reports storage apples as decreasing and as much lower than a year ago this same time.

California dairy council with dairymen from many sections of central California recently met in Fresno.

Ten years ago the San Joaquin Valley produced 70,000 tons of raisins; today its output exceeds 170,000 tons.

Watsonville apple dryers have declared against the proposition of marketing dried apples on a "moisture basis."

The County Supervisors Association of the San Joaquin Valley recently met in Fresno. Chris. Jorgenson of Fresno is president.

The state water commission listened to applications to appropriate waters of Tuolumne River at Modesto on Tuesday of this week.

Direct sale of raisins to jobbers and elimination of brokers is the new policy of the California Associated. The new plan will begin with the 1921 crop.

On February 8 the voters of the Fresno irrigation district will ballot on proposal to bond the district for $2,000,000. This is a step toward the Pine Flat project.

At a recent annual meeting of the Tulare County Mutual Fire Association J. W. McPherson of Orosi was elected president and A. P. Graybill, secretary and manager.

Owens Valley apple producers won many prizes at the fruit show recently held at Berkeley and now feel "Owens Valley apples are without exception amongst the finest and largest."

Annual election of officers of Stanislaus County Poultry Association resulted in selection of president, R. H. McDrew; vice-president, H. G. Brown; secretary, L. Miles, and treasurer, A. C. Drake.

Grape growers are asking as to the wisdom of contracting grapes this far in advance, especially if $100 per ton is offered, and the advice usually given is not to contract unless at least $50 per ton is deposited by the buyer.

The directors of the Modesto-Turlock irrigation district have approved and adopted plans for the construction of the Don Pedro dam. Two years will be required for completion of the project. The dam will have a capacity of 260,000 acre feet and its highest point will be 283 feet from the river bed.

Southern California

Some Limas have been sold as low as $5.25.

Correct dates for the orange show are February 18-28.

Banning almond trees are in bloom and heavy crop is promised.

This is Ventura County farm bureau's membership drive week.

The crop of Navels will be the largest ever grown in California.

Lima beans are looking blue; some sales are reported as low as 5¼.

Orange County has resolved to increase its membership 100 per cent.

Poultry Producers of Southern California holds annual meeting this week.

Orange County claims saving of $11,000 because of state fertilizer law.

Lima bean producers of Orange County met last Saturday at Santa Ana.

Perris irrigators are discussing bringing of water from San Jacinto River.

High school boys of Blythe, Riverside County, are forming potato growing club.

Coachella Valley now has an ambition to be a producer of pure bred cotton seed.

Excessive freight rates have prevented shipping of the Imperial Valley lettuce crop.

Arlington Poultry Association recently held meetings in connection with the farm bureau.

Farmers of Imperial Valley are discussing karakul or desert sheep to be raised for fur and wool purposes.

Covina farm center in annual meeting elected: President, B. F. Thorpe; secretary-treasurer, Grant Chapman.

The advance in freight rates will add more than $9,000,000 to the amount paid by orange growers in 1919.

Escondido Progressive Poultry Club recently elected: President, Mrs. Chas. Hudson; secretary, Mrs. J. A. Runser.

Many lemon growers refused to fire up during the frosty nights because prices of fruit would not justify the expense.

Imperial County's head lettuce is declared exceptionally fine but freight rates still holding much of it from going to market.

The Covina Citrus Association members have authorized the directors to proceed with building and furnishing houses for employes.

The station has been fitted up at Whittier, Los Angeles County, for the breeding of aphycus lounsburyi, the parasitic insect on black scale.

Nuevo, Riverside County, Cooperative Fruit Growers in annual meeting recently reported apricots sold for $85 per ton, while peaches mostly brought $100.

Citrus growers are protesting against 33 1/3 per cent cyanide tariff which they claim will be all for the benefit of one large American manufacturer.

Orange County Cow Testing Association reports great increase in average butter fat production. The best herd average for November was by the 20 cow dairy of F. T. Aitken, with 41.88 pounds.

The Coast and General

Michigan onion growers are demanding a one cent a pound tariff.

Several cargoes of Danish potatoes have been received in New York.

Jackson County, Oregon, farm bureau has a $5 per year membership fee.

Hood River, Oregon, is planting very extensively to berries and small fruits.

Cabbage grown in Denmark is selling in New York City at $12 and $14 per ton.

Walla Walla, Washington, gardeners have perfected a vegetable marketing association.

All small fruit producing sections of the Northwest are increasing their acreage of berries.

Washington state reports material losses to apple industry because of excessive freight rates.

The United States imports 154,820 gallons of green olives and 394,457 gallons of edible olive oil.

Ohio potato planters are finding trouble with certified seed, some of which has been condemned.

Onions are selling in Chicago at $1 to $1.25 a hundred with very free movement from surrounding states.

Yakima Valley, Washington, produced last year about 10,000 cars of apples, 9,000 of which were shipped fresh and 1,000 as by-products.

Yakima Valley, Washington, shipped out fruit during 1920 to the value of $15,500,000. This was nearly $5,000,000 lower than shipments of the preceding year.

Texas farmers are thoroughly aroused on the Japanese ownership situation and Japanese settlers have been urged to move on.

Oregon, Washington and Idaho recently proposed a joint meeting of the three states to discuss uniting of all coast and mountain states in a league to prevent Japanese ownership of lands.

The Chinese peanut crop for 1920 was better and larger than any preceding year. The peanut belt there produces about 400,000 tons annually, of which about 120,000 tons are exported.

Wheat growers of Montana are signing contracts for a six year marketing plan. Over 400,000 bushels have already been signed up. A series of meetings will be held the first week in February.

American National Livestock Association, recently in session in El Paso, recommended to congress enactment of constructive federal legislation regulating the packers, commission men and traders.

The Ohio University Clip Sheet suggests: Lightning rods may be placed on the silo with good effect, as the silo is likely to be the tallest structure in the farm building group and hence somewhat more likely to be struck by lightning." Why is a lightning rod?

Seattle is shipping to London by way of Panama Canal Northwestern grown apples. It has been determined that large quantities of 1921 apples will be shipped by the same route. The freighters now leaving Seattle have a refrigerator capacity of 3,000 tons.

Sixty Years of Beekeeping in California

By J. E. Pleasants

Mr. Pleasants of Orange County is one of the pioneer beekeepers of California, and qualified to touch upon the history of honey production in the state. He has written for the American Bee Journal the following article which touches upon 60 years of beekeeping, but we find his modesty has prevented reference to his own connection with the industry. We believe if Mr. Pleasants would give of his own personal recollections he would add materially to our fund of information as to beekeeping history. There are so many interesting items in the Bee Journal article that we take the liberty of quoting almost entire.

BEEKEEPING was introduced into the West by men of courage and enthusiasm. The distance from the older settled centers was great; travel was slow, accomplished by primitive methods and fraught with difficulties.

We are indebted to that intrepid enthusiast, John S. Harbison, for the beginning of our industry. From Mr. Harbison's own account we get the following data of the pioneer apiary of California. John Harbison came to California in 1854, and for two years he studied the flora of the state, while engaged in the nursery business. At the end of this time, he sold out his nursery and returned to his old home in Lawrence County, Pennsylvania, with the intention of bringing out bees.

Mr. Harbison had learned the care of bees from his father in boyhood, so was well equipped for his undertaking. He tells of the care with which he prepared his shipment, which was to make the long journey by water from New York to San Francisco via the Isthmus. He had the lumber for his hives sawed three-eighths of an inch thick to save on weight, as the freight from Newcastle, Pennsylvania, to San Francisco was very high. The hives, of course, were small, so Harbison added a chamber about 3x8x13, well ventilated with screen, as a place for the bees to get off the combs and carry out the dead.

He started with 116 colonies and lost only six on the journey.

Being a man of pleasing address, Mr. Harbison made friends with all with whom he came in contact, and was accorded all possible assistance by the ship's officers.

His first apiary was located in the Sacramento Valley. He readily sold all the bees that he was willing to dispose of at $100 per colony, and mentions colonies being resold at $200. The cost of bringing the 110 colonies from Pennsylvania to California was about $1,800.

Mr. Harbison made the first shipment of honey that went East from California. This was sent with the first carload of green fruit that was shipped to Chicago. In 1869 Mr. Harbison moved his bees to San Diego County, in the extreme southern part of the state, where he continued in the business until the time of his death in 1914. At one time he kept 3,750 colonies, divided into 12 apiaries. He sent the first carload of honey to go East from his San Diego apiaries. This honey was sold in Chicago at 27 cents per pound.

Mr. Harbison was a producer of comb honey. He invented a hive which was used in California until the introduction of the Langstroth hive here. He used two pound sections. He was at one time one of the largest comb honey producers in the world, and took many prizes for his exhibits at the Centennial and later exhibitions. Even a short time before his death he outlined a plan for a model apiary to be placed on the San Diego Exposition grounds in 1915. He was the author of a book on beekeeping, and his interest in his chosen pursuit never flagged.

Among other pioneer beekeepers were Wm. Muth-Rasmussen, Dr. Elisha Gallup, John F. Corey, R. Wilkin and N. Levering, the editor of the first bee publication on the Pacific Coast. This was the California Apiculturist, which was first published in 1882. Mr. Muth-Rasmussen was probably the first in California to use an extractor. He brought out a Peabody extractor in 1871. Prior to this all honey had been rendered out in sun extractors. Mr. Muth-Rasmussen writes that about three years after this he found others using home made extractors run by gear wheels. In 1873 he and Captain J. T. Gordon called a meeting and organized the Los Angeles Beekeepers Association, the first beekeepers association on the Pacific Coast. Mr. Muth-Rasmussen afterward moved to Inyo County, California, where he has since lived, and is a producer of comb honey.

There is an interesting story told in Gleanings of one of Mr. Corey's experiences, which will illustrate his determination to overcome difficulties. In the early days he was a mail carrier in the mountain regions of Northern California. On one of his trips he bought a small swarm of bees (probably a nucleus). This he carried on his shoulders over 100 miles, part of the way on snowshoes.

The first Langstroth hive was used here in about 1872, by John Beckley.

Among later men notable for their achievements in bee culture are M. H. Mendleson of Ventura County, Andrew Joplin of Orange County, John H. Martin, whose charming articles in Gleanings under the pen name of "Rambler" have been enjoyed by all readers of the magazine; M. C. Richter of the San Joaquin Valley, author of the bulletin on "The Honey Plants of California"; Willis Lynch, instructor and apiarist of Stanislaus County, and Messrs. Hauser and Hogaboom of the Sacramento Valley. Mr. Joplin's crop of extracted honey this year was about 25 tons from sage alone. Mr. Mendleson is probably at the present time one of the world's largest beekeepers. He came to California in 1880, and while he had kept bees previous to this, he worked with the veteran apiarist, Mr. Wilkin, to whom he pays this tribute:

"Mr. Wilkin was one of the most scientific, orderly and practical of men. He was a good and patient teacher and was resourceful and a genius in creating conveniences. It was a pleasure to work in his bee yard, everything was so clean and orderly."

Mr. Mendleson's apiary, at its largest, contained 2,000 colonies, and his largest yield for one season was 101 tons, taking out and extracting as much as three and one-half tons in one day. His Piru apiary of 700 colonies is on a hillside among most picturesque scenery, and is terraced. Each terrace contains two rows of hives facing the alley way in pairs, a numbered stake between each pair, and an individual record kept of each colony. All queens are replaced every year or two with the very best Italian stock.

Among the many younger men who have made notable success as apiarists we will mention only two, for lack of space. L. L. Andrews of Corona, son of the veteran inspector of apiaries of Riverside County, and George J. Brown of Orange County. L. L. Andrews got his start by digging 24 colonies of bees out of rock caves and trees. He added to these by purchase and increase until he now has 1,000 colonies, and his crop this year from orange and sage was 60 tons. Mr. Brown began as a boy, some ten years ago, and now has 800 colonies. His crop this year was 50 tons.

In the beginning of the bee business in California we had several problems to solve. The package problem seemed one of the most complex at the start, but was the quickest solved. We used kerosene cans mostly, though some used barrels. The experience of some of the beekeepers who tried barrels was harrowing to relate. I had two neighbors who stored their honey in barrels, waiting for a better price. They never got it. All through that winter, which was quite dry, the honey leaked out just about as fast as the bees could take it up. My bees went through fine that winter, as they were near enough to my neighbor's honey barrels to use them as feeders. Those of us who used kerosene cans will never forget those days of cleaning and soldering, when preparing for a honey flow. But from the ancient kerosene can was evolved the modern honey can and case, California's bequest to the extracted honey producers of the country.

The price of honey was good at the beginning, for a few years. Then it dropped very low. I remember selling extracted honey in 1877 for nine cents, but from 1877 until about 1884-1885 the beekeepers were in luck if their honey netted them three cents.

The cause of this was exorbitant freight rates on the one hand and the treatment we received at the hands of the commission men on the other. In fact, matters got so bad that producers quit sending their honey to the commission houses. That forced the buyers to come into the field; and while prices were not what they should be, we at least had the satisfaction of selling our own honey. Now the California Honey Producers Exchange bids fair to solve the marketing problem. This was organized over two years ago for the purpose of marketing honey and buying supplies. It was organized with the assistance of the state market director and is modeled to some extent on the plan of the fruit exchanges. There are about 70 per cent of the commercial beekeepers of the state in the membership, with new members coming in regularly. In addition to furnishing honey in carload lots to the buyers, the exchange is now putting up honey in small packages, which are being sold to wholesalers, who do the distributing. The California Exchange is young, but so far is meeting with a fair measure of success.

Up to about 30 years ago most of the honey of the state was produced in the southern part, and exclusively from wild plants. Now beekeeping is a thriving industry in the northern part also, as well as in the large interior valleys. While we still depend upon the wild flora for our mountain apiaries, the bee forage along the foothills and in the valleys has been largely increased by the large acreage planted to oranges and beans in the coast counties, and by the alfalfa fields of the interior valleys. The Sacramento and San Joaquin Valleys have hundreds of thriving apiaries fed by alfalfa and lippia. Alfalfa does not furnish nectar in the cool coast region to anything like the extent that it does in warm inland valleys. Another comparatively new section, rich in the production of honey as well as of other resources, is the Imperial Valley, lying in the extreme southwestern portion of the state. This valley is truly one of the wonderlands of the Southwest. A reclaimed desert, as it were, but of a soil rich in silt washed for ages from the overflow of the Colorado River; soil which only needed water to produce anything in the dry, warm climate in which it lies. Water is now had in abundance, and its alfalfa fields yield an ample supply of nectar to thousands of colonies of bees. While honey is not produced commercially in all parts of California, in the last 25 years the industry has very materially increased. We still produce almost as much from the native plants, and the great increase of forage from cultivated plants has enabled many more to engage in the business. The wild pasturage of Southern California is pretty thoroughly stocked, so there is little room in the sage belt for beginners, unless they buy an old range.

I believe California now leads in the production of honey. The honey for the most part is of excellent quality. There is no more delicately flavored honey than that produced by the sages, and it is of excellent body when allowed to ripen properly. The orange honey is also beautiful to look upon and is of a spicy flavor, recalling the fragrance of the orange blossom itself. It is a very common practice for beekeepers here who can obtain suitable locations to move from orange to sage and thus get two flows in one season. Some then move to the lima bean fields and get three The bees there are largely Italian though Cyprians, Carniolans and Caucasians are used by some. Of course there are plenty of hybrids. Almost all the beekeeping counties have county clubs which serve to keep the members in touch with each other's work and socially.

The state has a good foulbrood law, providing for an inspector for each county where the beekeepers demand one. The system of inspection has been thorough, the inspector giving his whole time to the work during the season, and subject to call at any time. American foulbrood has been greatly decreased, and is altogether under control. European exists in some localities, but is not near the menace that it was.

Grain dust and similar mill siftings appear harmless, but filtered through the air and ignited in a closed structure, they are as deadly as dynamite. Such explosions cost 80 lives and $7,000,000 property damage in 1919. The United States department of agriculture dust explosion investigation service has practically eliminated the evil.

EDITORIALETTES

Only a bit of waste water is shown on the cover this week, and this is in Tulare County, where every drop of water is valuable. The war has forced us to make sacrifices and to study wherein every part of our resources may be conserved in the interests of all the people. It seems today that the need is none the less for conservation, not only that our finances may be of value in advancing the country's interests, but that our soil and our water shall be compelled to do their utmost. Water cannot be forced to do its utmost when it is conducted in sluggish lagoons or in open canals over gravelly soil. Concrete is expensive; water is more so.

* * *

The California State Irrigation Association is making a strong fight for an appropriation to provide means to enable the state engineer to make investigation and report on the feasibility of the Marshall plan. With the Marshall plan proposing an ultimate expenditure which may reach $750,000,000—which is some appropriation for a single state to attempt—there is perhaps sufficient opportunity for activities without other dreams being referred to as having possibilities along that line. The Marshall plan thoroughly covers the great central valley, and even water for some of the coast and bay counties, likewise a liberal portion for the northern part of Los Angeles County. But there are many storage possibilities in other southern counties which should be availed of. There are the Little and the Big Tejunga, San Gabriel, San Antonio, Santa Ana and other canyons, which have never been fully investigated. These should not be used to jeopardize in any way investigation of possibilities of success in the Marshall plan, but the state is big enough to take first steps in conservation in all the counties of the state.

* * *

Mr. Royce is furnishing, on Page 148 of this issue, a number of most interesting notes on legislative matters at Sacramento. Other items will follow week by week.

* * *

Two strong organizations, the National Grange and the National Federation of Farm Bureaus, are watching legislation at Washington. It appears that they are doing some good work and keeping the country informed. The Grange is making a special effort to secure the passage of the Wadsworth-Kahn bill, which provides for the creation of a government corporation to operate the government nitrate plant at Mussel Shoals, Alabama. It is declared that the material on hand as the result of its operation during the war period, if sold, would assure the continuance of this great plant and provide nitrogen to thousands of American farms. The Grange declares that no additional appropriation would be called for.

* * *

The Capper-Volstead collective marketing bill seems to be taking a recess in its activities. This bill provides for release of cooperative farm organizations from the operation of the anti-trust bill, but the enemies of the bill have succeeded in putting on a rider, or amendment, which practically removes all the features favorable to cooperative marketing and leaves the farmer standing where he is today, subject to prosecution similar to that recently undertaken against raisin growers. Cooperators have promised to turn in and defeat the bill if the present amendment is forced through.

* * *

The emergency tariff measure is still stirring up the animals. The importing interests are fighting it tooth and nail. The would-be friends of the importer and some friends of labor are endeavoring to use farm products to beat down the cost of living. The number of farm products to be added to this emergency tariff list has been greatly increased, and all poultry and dairy, wool and meat products have been added to fruits, nuts and farm products which were at first under consideration. The conditions for final passage of this bill are rather more favorable than they were a week ago.

* * *

The California Breeders Sales and Pedigree Company, which has been such a factor in advancing the pure bred interests of the state, announces a change in plan by which it becomes even more cooperative than before. Beginning with 1921, it will refund any surplus accruing in each calendar year from sales of registered livestock, whether consigned by members or nonmembers. Heretofore there has been participation on the part of all members, and as a truly cooperative organization the membership was open to all owners of pure breds.

WHO PAYS TAXES?

Unless the people wake up and say something pertinent, even pungent, to some of the corporation assemblymen who voted down the King taxation measure, they will have a neat little addition to their tax bill. The vote stood 49 for and 30 against, but, being a taxation measure, it requires two-thirds majority for passage, and one of the strongest lobbies which has gathered for years at Sacramento succeeded in defeating the people's measure. The lobby insists that the measure which provides that the corporation taxes shall be increased one-third in order to meet necessary expenditures will only result in the railroads and others passing the burden back to the producer for hauling his products to market or for other service rendered. Perhaps this is true, but why the energy exerted by the lobby at great cost?

The friends of the measure are strong enough to vote for and secure reconsideration. This will probably be one of the first matters taken up after the present interim or recess. Here is the roll call:

Ayes—Anderson, Bernard, Broughton, Christian, Cleary, Cleveland, Colburn, Coombs, Crittenden, Cummings, Eksward, Fellom, Fulwider, Hawes, Heisinger, Hornblower, Hughes, Hume, Johnson, Frank, Johnston, J. W., Jones, G. L., Jones, Isaac, Kline, Lee, George W., Lee, Ira A., Lewis, Manning, Mather, McDowell, McKeen, Morrison, Parker, Parkinson, Pettis, Powers, Prendergast, Roberts, Rosenshine, Ross, Saylor, Smith, Spalding, Spence, Webster, Wendering, West, Windrem, Wright, T. M., Speaker Wright.

Noes—Badaracco, Badham, Baker, Beal, Benton, Bishop, Bromley, Brooks, Burns, Graves, Gray, Greene, Gart, Heck, Hurley, Long, Loucks, Lyons, McCloskey, McGee, McPherson, Merriam, Mitchell, Morris, Pedrotti, Ream, Stevens, Warren, Weber, White.

Some of these assemblymen who voted "No," it may be observed, are representing agricultural districts.

The Taxpayers Association seems to be in for plenty of censure on the part of the people who are in favor of keeping the taxation where it belongs—on the corporations. It certainly is standing loyally by the corporations in their effort to defeat this measure.

EAT OLIVES

George C. Mansfield of the Oroville Register is fathering a little olive eating boom all his own. He calls attention to the blow which was delivered to the industry and appeals to Californians all to aid in reestablishing the olive in public esteem. He speaks of California Olive Day, February 21, and asks all to join in the campaign to:

Restore normal consumption in California.

Start a wave of favorable publicity eastward from the home of the ripe olive.

It may interest you to know that experts state there are 350,000 acres in the Sacramento Valley and its adjacent foothills, 350,000 in the San Joaquin Valley and its foothills, and 100,000 acres in Southern California where the conditions are particularly suited for the culture of the olive. There is no industry that belongs to every part of the state as much as the olive industry. Its ultimate development should mean a state income of at least half a billion dollars. If the consumption of New York City equaled the average consumption of a California city during normal times, New York City would consume California's entire production at the present time.

Time alone is the great testor

As the sands run through the glass of life the things that are real abide while the the unworthy pass away.

Since Byron Jackson produced the first pump that virtually gave birth to irrigation in the west pumps of many names have come and gone. Time, however, has only served to better establish Byron Jackson products.

Buyers of Byron Jackson deep well turbines make an investment that is founded on this enduring past.

Let us furnish you the name of a neighbor who is a Byron Jackson user.

Almonds: Effect of Culture is Quite Marked

By T. C. Tucker

ALL varieties will vary in size from season to season and in the different orchards during the same season, depending upon the plant food and moisture supply available during the time the nuts are maturing. Some varieties will vary more in size than in plumpness, while other varieties are more inclined to produce somewhat shriveled kernels and imperfectly developed shells and the variation in size will not be as great. Exchange members know the great care required to maintain quality, so you can readily understand why Blue Diamond Brand almonds are always full meated, perfectly developed almonds. As the trees bear a larger crop the almonds produced are inclined to be smaller. Young, vigorous trees with a light crop will often produce unusually large almonds with comparatively thin shells. The value of a variety, therefore, will depend largely upon its behavior after the trees reach full maturity and bearing. The Exchange issues to grower members a monthly bulletin containing the latest scientific method of culture.

The almond of commerce is encased in a thin, brittle shell, but on the tree this shell is enveloped in a thick, grayish green hull. When nature begins to open the outer hull of the almond, harvest time draws near.

The harvesting of the crop should be commenced as soon as the hulls have opened to their fullest extent and no time should be lost in completing the work. The nuts in the center of the trees are the last ones to ripen and so may be used as indicators. If harvesting is commenced early, the nuts will cling to the tree rather tenaciously, and knocking must be vigorous in order to shake them loose. On the other hand, if they are allowed to remain too long after they ripen a number of difficulties may be encountered. They may be thrown to the ground by light winds and the cost of gathering be increased, which quite commonly occurs, or the hulls may dry up and in doing so close around the nuts to a greater or less extent and add to the cost and difficulty of hulling. Time of harvesting in California varies according to the district. Strong winds will break off a great many of the nuts of any of the varieties, and promptness is doubly essential where there is any likelihood of such winds during the harvest season. Depredations by birds may cause serious losses, especially with the soft and paper shell varieties.

The crop is gathered by knocking the ripened nuts and hulls with long poles onto sheets spread on the ground under the trees. The knocking should be done near the portions of the trees where the nuts are borne and by striking a number of light, quick blows, rather than by a heavy blow aimed to jar a large branch. This will avoid injury to the bark by bruising and will accomplish the work in less time. The blows should always be delivered squarely against the branch. A glancing blow will tear the bark and break off a great many fruit spurs, thus reducing the bearing surface for the next year. For this reason, harvesters must be watched closely all the time to insure the proper use of the poles. The sheets, two in number, are spread under the trees so they will overlap and catch all the almonds that fall. When sufficiently loaded with nuts to make dragging the sheets from one tree to another difficult, they are emptied into lug boxes and sent to the huller.

The character of the harvesting equipment may vary considerably, depending on the acreage, character of trees and ground, time required, capital available, and the personal wishes of the owner. Some growers use heavy poles of pine, spruce or fir, while others prefer the lighter bamboo poles. The heavy poles are from 1½ to 2 inches in diameter at the base and from ¾ to 1 inch in diameter at the top. Experience has shown that poles of this type over 20 feet in length become unwieldy, and not only swing slowly but do more damage because of the greater difficulty of control. Most growers prefer 16 foot poles with a few 20 foot ones for use in the tops of the tallest trees. Where the tops cannot be reached with these, the men climb into the trees with shorter poles. The bamboo poles used are about 24 feet long and because of their lightness can be used with greater speed. Bamboo, while easy to handle, cracks so badly when exposed to the sun that it can hardly be considered a success. The sheets used are made of duck ranging in weight from 7 to 12 ounces. Sizes of single sheets range from 12x24 to 24x48 feet. Sheets need not be much longer than the longest diameter of the tree.

After harvesting, the almonds, hulls and all, are taken while still moist to the huller to separate them. If they become dry before hulling they must be dipped in water or the shells will be broken. All hulling was formerly done by hand, and this is still done where only small lots are to be handled. The invention of machinery for this purpose has reduced the cost of hulling materially. Most outfits separate the hulls from the nuts before they leave the machine. Some of the hand hullers consist simply of the hulling portion of the larger power machines without the separating screens. Where a man has a small acreage and is too far away to haul to a large huller, a hand machine will greatly facilitate the work, even though the final separation must be done by hand.

There are three different kinds of hulling and separating machines now in operation in California, all invented by California almond growers.

After the hulling operation all almonds must be gone over by hand to remove pieces of hulls and inferior or gummy nuts. Where canvas drapers are not available for sorting directly from the huller, the nuts are piled in hoppers and sorted on benches beneath them.

Headquarters of the Skookum Packers Association has been moved to Wenatchee, Washington.

CITRUS FRUIT FUMIGATION SAFEST BELOW 80

While it has long been known that the presence of light during fumigation of citrus fruit with hydrocyanic acid is one of the factors which cause injury to both fruit and foliage, it has not been known that light before and after fumigation has a similar effect. This fact has been disclosed by recent tests conducted in California by specialists of the United States department of agriculture, who have made a report of the experiments with suggestions for preventing injury, in Department Bulletin 907, "Fumigation of Citrus Plants with Hydrocyanic Acid: Conditions Influencing Injury."

Moisture and temperature, as well as light, influence fumigation injury, and experiments show that fumigation is more safely performed at temperatures below 80 degrees Fahrenheit. It has long been known that citrus trees are less liable to injury from hydrocyanic acid gas fumigation when treated at night. The bulletin points out that in order to prevent injury due to sunlight, diffused light or darkness both before and after fumigation is desirable.

Sunshine fumigation can be conducted with safety, the department's specialists say, only by proper regulation of the amount of gas used and length of exposure. Moisture on citrus plants does not increase the degree of injury, and an application of cold water on plants in hot sunshine immediately prior to fumigation appears to reduce slightly the effect of the gas. Sudden changes of temperature over a wide range during exposure tend greatly to increase plant injury. Trees in wet soil are likely to be more severely injured than healthy trees in dry soil. Therefore, irrigation should follow rather than precede fumigation, according to the bulletin.

Commissioner Collins reports Tulare County's production of grapes as: Raisin, 24,000 tons; table, 60,000 tons; wine, 26,000 tons. The county's output of Navel oranges was 1,390,160 boxes; Valencias, 735,970.

This Man Markets His Apples at Home

By Delphia Phillips

THE climate of California is not, as a rule, adaptable to growing apples of snappy flavor, except in the mountain districts, being too soft, and without the freezes that seem to create the tang to the apples of the colder regions; but there are some varieties and some localities that reverse this rule. The varieties are the Pearmain, the Bellfleurs, the Banana, Stark's Delicious, and the Arkansas Beauty. The locality is the strip of coast tableland extending a few miles inland from the ocean.

That well flavored apples could be grown in this section has not been very much appreciated as yet, for few realize that they can be produced outside of the mountain districts.

One of the successful growers of apples on the coast tablelands is Donald J. Dodge, of Costa Mesa (which is Spanish for coast tableland), Orange County. Mr. Dodge is really the pioneer in apple raising in this section, at least in a commercial sense.

Some of his methods in growing and marketing his apples could be followed to advantage in almost any locality in the United States. And the fact that he took up apple raising with absolutely no experience, being city born and bred, and made a success of it in less than seven years ought to encourage somebody.

With nothing but the bulletins and instructions of the agricultural department to guide him, Mr. Dodge embarked in the business of apple raising at Costa Mesa. He has 15 acres planted in apples on his ranch, which is two miles back from the coast and 90 feet above sea level. The soil is a fine, sandy loam.

The first trees were planted in 1912, and the methods followed were those commonly employed in a country where irrigation is needed. Tree holes were blasted out and filled with water before the trees were planted. Mr. Dodge took good care of his trees from the beginning and they were sprayed from the time they began to bear.

After a few years, the people in the nearby beach towns began to realize that some very finely flavored, crisp, local apples were coming into their markets, and to inquire where they were grown. They were surprised to find the source so near at hand.

But Mr. Dodge's plan of disposing of his apples is the most interesting part of the work.

Little by little, he built up a reputation for choice apples, until people from all over the county, and from beyond, began coming to his ranch to buy the Quality apples, as they were called.

Mr. Dodge does not market any of his apples, as he has all the customers he can serve, who come right to his door. It is his belief that shipped apples are always picked too green, and he tests his apples for sugar content as beet growers test the beets.

No culls or inferior apples ever go into the Quality boxes, and the same customers have returned from year to year since he first began to sell apples from his orchard.

The Dodge acreage is near a well traveled public highway and signs point the way to the Dodge orchard. Sometimes as many as 43 machines in one day have stopped at the place to buy.

Mr. Dodge has another plan for his customers which is worthy of note. For those who wish to order apples for later use at harvest time prices, he will place as many boxes as desired in cold storage, to be called for by the customer when desired. All apples are placed in cold storage 24 hours after picking so as to insure firmness.

The writer was privileged to taste some winter Pearmains which had been in storage for ten months. They had been taken out in warm weather, and had been out almost a week, but were still firm and of good flavor. As a general rule, they will stand up for about two weeks after being removed from storage. Some of Mr. Dodge's customers order as many as 15 boxes.

One tribute to the reputation of the Quality apples is the fact that other growers, not so careful about spraying, etc., come to buy apples from the Dodge orchard.

Mr. Dodge sprays about five times during the year. His worst enemy, and yet the easiest subdued, is the codling moth. Trees are whitewashed in December to prevent sunburn. Irrigating is done about four times in the year, depending on the season, and the amount of rainfall, and all cultivation is done with a disk harrow, operated by tractor.

A herd of Duroc-Jersey hogs consume the orchard culls.

In 1919 Mr. Dodge's customers numbered 450, and he sold 350 tons of apples. He expects to about double the latter amount this year. The selling season opens in September and lasts until December.

WRAPPING APPLES IN OILED PAPER CUTS DOWN SCALD LOSS

Wrapping apples in oiled paper has been found to prevent apple scald, a cause of heavy loss during storage and transportation. As a result of investigations by the United States department of agriculture a great many of the fancy packed apples are likely to go out next year in oiled instead of plain wrappers.

Scald, department specialists have discovered, is caused by gases given off by the apples themselves. The gases contribute to the flavor of the apple and recently were segregated and identified by department chemists who even went so far as to build up a synthetic apple odor from chemicals obtained from outside sources. Pending practical use of this discovery, which is attracting scientific attention both here and abroad, the specialists of the bureau of plant industry have applied the distilled chemicals to apples and checked up on

Bartlett Pear on Japan Roots

We still have some fine Bartlett as well as Bosc, Anjou, Comice, Flemish Beauty, Winter Nellis and other leading varieties of pears on Japan Pear roots.

These trees are grown on new soil never before in nursery stock, are well rooted, clean, healthy and hardy.

Hundreds of thousands of our trees in all parts of the West are now bearing profitable crops for their discerning owners.

We also carry a complete line of general nursery stock, all of which is guaranteed to please you.

Remember our prices cover freight and packing charges.

their theory as to the cause of scald.

Scald, it has been found, can be entirely prevented by storing apples in oiled (not waxed) wrappers. A good quality of oiled wrapper can be prepared by hand, but the cost of labor is too great. The oiled paper on the market in 1920 had been prepared for other purposes and was too heavy for convenient use, but manufacturers are now preparing lighter weight oiled papers for the 1921 crop.

Ventilation has also been proven to be a remedy for apple scald, but it has been found extremely difficult to secure under commercial cold storage conditions.

NEW NAVEL BUD VARIATION

The attention of the Cultivator was called to an aberrant type of Navel orange, by V. F. Blanchard of the Los Angeles farm adviser's staff, growing in a Sunland orchard. These trees were photographed and data and photos sent to A. W. Shamel of the bureau of plant industry at Riverside. After visiting this orchard Mr. Shamel replies:

"My impression is that this peculiar leaf condition on these trees bears many of the earmarks of a distinct strain of the Navel orange and the occurrence of single tightly rolled leaf branches in otherwise normal leaf trees points to the origin of this strain from bud variations. Of course we are unable to say definitely whether or not this is the case; however, Mr. Milliken took some buds at our suggestion from one or two of the typical rolled leaf trees and will insert them in seedling stocks in the experimental nursery of the Exchange at Lamanda Park. The behavior of these buds will indicate whether or not this is a strain and as to whether this peculiar leaf characteristic is heritable.

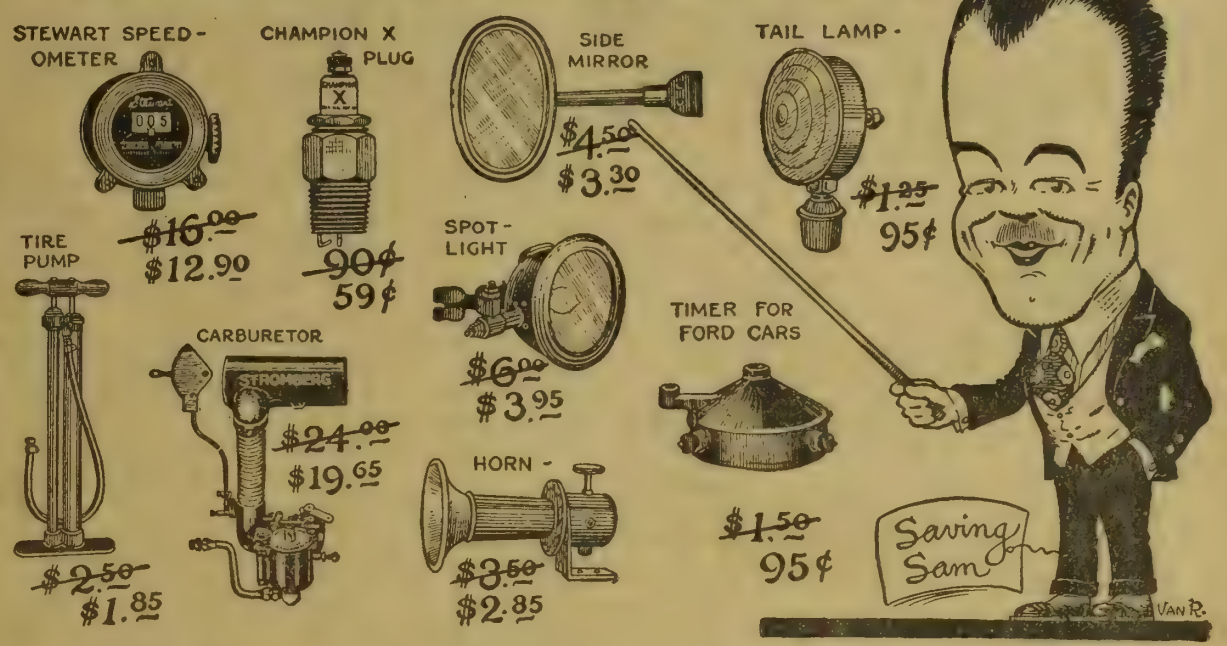
"My impression is, from examining the fruits that they resemble one of the Thomson Improved strains of the Washington Navel orange. The texture of the rind, the color of the fruits and the texture and qualtiy of the flesh of the fruits are very similar to the Thomson type. At the same time, they are somewhat different from any of our Thomson strains which we have studied thus far. I mean by this that the shape and color of the fruits, the texture of the rind, the thickness of the rind and the rag characteristics are somewhat different from that of any of the Thomson strains which we have studied in our performance record plats of this variety. I could not discover from the casual examination which we gave these trees and their fruits any marked difference in the fruits on the trees of the rolled leaf strain and those of the normal leaf strain. Most of our studies heretofore have been concerned with fruits rather than foliage characteristics. Of course, the type of fruit is often correlated with certain types of foliage—as, for example, in the case of the Australian and Golden Nugget strains of the Washington Navel orange.

"I have observed a few cases that were apparently similar to the rolled leaf trees in the Kirschman orchard but have assumed that they have been due to some local environmental or pathological condition. The trees in the Kirschman orchard, however, present such a marked and complete opportunity for study that I believe that it will be well worth while to give them further study, from the standpoint of discovering whether or not this condition is due to bud variation or other causes. As I said in the beginning of this letter, it seems from a casual observation of the conditions in this orchard that this peculiar leaf condition is apparently due to bud variation and is a foliage mutation from the normal Washington Navel variety. It is very interesting and I think may be a very valuable instance of the behavior of citrus trees and I hope that further study will bring out as to whether or not the rolled leaf condition is a heritable or non-heritable characteristic."

INFECTED FLORIDA GRAPEFRUIT

Quarantine Officer Vary reports intercepting at Los Angeles two boxes containing Florida grown grapefruit shipped from Ogden, Utah, badly infested with purple scale and infected with Phomopsis citri. This fruit was wrapped in Florida wrappers and packed in apple boxes, the bottom and sides of which were lined with heavy manila paper. The top of the box was faced with apples which showed through the cover, making them appear to be boxes of apples. They were labeled "Fancy Delicious" and in addition to being securely nailed were tied with heavy cord. These two boxes were included in a lot of about 200 and were destined to parties in one of the citrus growing communities of Los Angeles County. A letter addressed to the consignee informing him that these boxes must be sent out of the state or destroyed was returned to this office by the postmaster marked "party unknown." Everything in connection with this shipment would indicate that it was a willful attempt to evade the law. These boxes, together with several others of grapefruit from the Southern states, were confiscated by this office and taken to the city incinerator and burned.

SAVE 1/3 ON AUTO SUPPLIES



These Are Examples of Our Low Prices

And you can easily see why we can save you 20% to 50%, or on an average of about one-third on your auto supplies. The goods go direct from the factories to you through one of our big stores, requiring but one small profit to be added instead of four, as in the usual way. Why should you pay the BROKER, JOBBER, TRAVELING SALESMAN and DEALER all four a profit to get the goods from the factory to you.

Also, the enormous volume of goods we buy to supply our 14 BIG STORES and our MAMMOTH MAIL ORDER BUSINESS, reaching from the Mississippi River to the Pacific Coast, gives us a buying power which insures lowest possible cost. Also, we control the manufacture of many articles. Where the small dealer buys in dozens we buy in thousands. You know this enables us to buy for less and YOU, THE CUSTOMER, get the saving.

Although our prices are unusually low, do not forget that first of all "Western Auto" is a QUALITY house. Quality always comes first with us. That is why every article we sell is new, fresh, standard stock, sold with our iron-bound guarantee of money back if not exactly as represented.

You are as safe in ordering by mail from us as if you selected the articles yourself. Try us now on anything from a cotter-pin, bolt, nut, gasket or bearing to a new top, body or tires, and let us prove our claims.

If you haven't one of our big free catalogs send in the coupon below to the store nearest you TODAY.

THE PEAR THRIPS

The pear thrips was first recorded in California as a new species in 1904 and for more than ten years it has been an orchard pest of considerable importance in the counties adjacent to and in the San Francisco Bay region. It first became serious in Santa Clara, Alameda and Contra Costa Counties, but in later years developed importance in Solano, Napa, Sonoma, Monterey, San Benito, San Joaquin, Sacramento, Yolo, Marin and San Mateo Counties.

The appearance of the pear thrips in the orchards is sporadic; no two successive seasons are alike in any particular locality. It becomes destructive in small or in large, widely separated areas and may be very unevenly distributed in these. It is seldom that a large body of contiguous orchards is found uniformly infested; there may be a small district here, an orchard there, or a number of orchards having serious outbreaks, while neighboring trees escape injury. It is true that some individual insects may be found in practically all orchards, but in many they are not found in sufficient numbers to injure the crop. This fact has not been entirely explained, but the chief factors responsible therefor probably are climatic conditions, general orchard practices, artificial control and natural enemies.

The following miscible oil formula has been successful: Miscible oil, 5 gallons; nicotine sulphate, 1 pint; water to make 200 gallons.

This formula for use against adult black thrips to be applied liberally as soon as any considerable number of insects is found. Do not fail to make daily inspections after buds begin to swell.

The development of nicotine dust sprays for aphis control has suggested a method which is proving successful with the thrips. They save in time and money. A five per cent nicotine dust mixture has proved successful.—E. O. Essig in Circular 223, "The Pear Thrips," California College of Agriculture.

BROWN ROT OF APRICOTS

W. L. Howard and W. Y. Horne are authors of the latest bulletin from the agricultural experiment station of the state college of agriculture. It is Bulletin 326 and touches upon the brown rot of apricots.

Brown rot is a fungus disease affecting apricots and various other stone fruit trees. It attacks both the ripening fruit and the twigs; but since the attack on the ripening fruit is serious, it is to this attack that reference is made when speaking of the brown rot. In California, however, the attack on the twigs has attracted more attention. In this the withering flowers become infected and not only the blossoms and young fruit are killed but also the twigs to a distance of several inches. Atmospheric moisture favors the growth of the fungus, which forms spores in gray pustules of about the size of a pin head on rotting fruit and on blighted flowers and twigs. In California it is practically confined to the regions exposed to ocean influences and does not develop except in times of unusually moist weather.

Plant Teague Citrus Trees

THEY ARE GROWN FROM SELECTED BUDS

A. D. Shamel of the U. S. Department of Agriculture says:

"The citrus nursery business is usually conducted by men of experience in growing nursery trees and who specialize in this work. All progressive nurserymen are now agreed as to the necessity for using scientifically selected buds in their business. Ordinary citrus trees grown from guesswork buds are very dear at any price. No intelligent planter or propagator will buy such trees or buds, no matter how cheap their price may be when it becomes generally understood that reliable trees grown from carefully selected buds, and reliable budwood are reliable. The slight difference in price of ordinary trees or buds and the best trees and buds is usually made up, in the improved production of the reliable trees or buds in their first crop."

We Can Still Supply Washington Navels, Valencia Lates and Eureka Lemons

of the quality mentioned by Mr. Shamel, but the supply for 1921 planting is limited, so place your order early and be sure of getting what you want.

Avocados, Feijoas and Other Subtropical Fruits

We still have a nice assortment to select from.

Deciduous Fruits

In order to accommodate those wishing to plant a variety orchard for home use we have an asortment of deciduous fruit trees and can take care of any such orders while our stock lasts.

We are always glad to show intending planters over our Nurseries and advise with them regarding tree planting.

SPRYWHEEL

The $150 Tractor—Crating and Freight Extra

"Multiplies Man Power by Five from Seedtime to Harvest"

Why Every Farmer and Gardener Should Use a SPRYWHEEL

Thorough cultivation is the first essential of good farming. Much of it has always been done by hand—and hand hoeing is hard, expensive drudgery.

This is the work Sprywheel enables every farmer and gardener to do economically and as often as necessary. It enables one man to do more and better work than any five men pushing hand tools.

Sprywheel won't do everything from breaking new ground to grinding grain, shredding corn, sawing wood and cultivating onions. We don't know of any machine that will do all of these jobs equally well.

But Sprywheel will do any work a hand or wheel hoe can be used for. It practically eliminates hand hoeing.

The market gardener knows

the necessity for timely cultivation. He often attempts to overcome the excessive cost of hand hoeing by spacing rows wide apart so that a horse-drawn cultivator can handle most of the cultivating work. Or he cuts down his acreage.

Using Sprywheel, every row can be cultivated as often as necessary. Profits per man and per acre simply multiply.

The half acre home gardener

often cuts down his garden patch because of the difficulty of getting the cultivating done. Sprywheel solves his problem. Besides tools for weeding, mulching, hoeing and hilling, there is the Sprywheel Lawn Mower Attachment. Attached in less than five minutes, it converts the Sprywheel into a power lawn mower.

For farmers who raise staple crops

—tobacco, cotton, peanut and corn growers, sugar beet farmers, etc.—the Sprywheel is quite as valuable. After plants have grown high or spread into the rows so that horses can't be put in without damage, Sprywheel provides continuous cultivation at the very time cultivation is most necessary.

Cost of Sprywheel operation

One gallon of gasoline runs a Sprywheel all day. Enables one man to cultivate fifteen miles of wide, single row, considerably more with the two or three row attachments—used while plants are small with rows planted close together.

Sold by authorized Sprywheel dealers

The Sprywheel is sold by authorized Sprywheel dealers who are granted exclusive territory. Write today for a Sprywheel catalog and the name of the nearest Sprywheel dealer.

"We Had Been Wishing for Just Such a Small Tractor"

Sprywheel Division, H. C. Dodge, Inc., New York City.

HICKS NURSERIES
L. Hicks & Son
Westbury, Long Island, N. Y.

Gentlemen:— Oct. 22nd, 1920

Last summer we were up against it, having had a large area of little evergreens in rows 15 inches apart where the weeds were growing so rapidly that we could not get ahead of them by hand-hoeing or wheel-cultivating.

It was during the above period that your agent appeared with one of your tractors and we lost no time in putting it to work, as we had been wishing for just such a small tractor. We worked Sprywheel in blocks that were planted in squares both ways and on diagonals.

Boys take to the Sprywheel enthusiastically.

Commuters who have gardens of one-half acre or larger should lay them out in rows so as to use a tractor such as yours. They have found it impossible to secure sufficient time to properly cultivate their ground and are especially prone to neglect the cultivation of their fruit trees, which, in this sandy sub-soil, suffer from lack of moisture, and we recommend that they try the Sprywheel.

Very truly yours,

HICKS NURSERIES Per—Henry Hicks.

TOP-DRESSING TALK No. 5

How to Fertilize the Orange

Rate of Application

For the lighter types of soil the rate of application of *Arcadian Sulphate of Ammonia* should be from 300 to 500 pounds per acre, divided into three applications. On the heavier types of soil about one-half this amount.

Time of Application

The first application should be about four weeks before blossoming; the second when the fruit begins to set, and third about the middle of June. Very often it is advantageous to make a fourth application in September. This not only helps "size" the fruit, but promotes wood and bud growth for the following season.

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. *Arcadian* is the kiln-dried and screened grade, made fine and dry for top-dressing purposes. Ammonia 25¼% guaranteed. Made in U. S. A.

Napier or Elephant Grass

WE have received so many inquiries concerning Napier grass, its culture, habits uses, etc., that we here give our readers the latest up to date information, furnished us by H. L. Musser, who is giving much attention to its introduction into California.

"It is only four years since our attention was attracted to the exceptional growth of Napier or Elephant grass. Since that time it has been tried under varied conditions of soil and climate. It thrives alike on light or heavy soil, provided ample water is applied. It is also wonderfully drouth resistant. Six hundred dormant joints were planted in moist clay soil May 15, and without any rainfall or irrigation. On November 21 75 per cent were living; many had grown to bloom and were seven feet high with 10 to 20 stools, and never during the summer did they show any distress, like corn with parched foliage.

We have been told by one authority that it is not a beef producing forage for range cattle, but milk cows feeding for two weeks on our demonstration plot, after feeding on alfalfa hay, showed no decrease in the quantity of milk.

Picture No. 1 shows the demonstration plot January 1, 1921, with a second season's growth of Napier before the two cows were turned in to feed upon it. Two weeks later the cows had cleaned it up.

After four years of observation we are convinced that the best use for Napier is in the way of a permanent pasture or browsing field. The cattle cannot destroy it, and if given an abundance of water frequently, it will grow three feet every four weeks. One acre with a good start will grow faster than five cows can eat it. With scant moisture it will give more pasture than any other crop except Sudan sorghum.

If allowed to grow during the summer and early fall when other feed is plentiful it will produce more feed for winter browsing than any other crop, because a branch grows at every joint from the ground up.

As a pasture for chickens, rabbits, goats or cattle, a well established plot of Napier, with sufficient water, cannot be excelled. It withstands much cold. By that we mean that the crowns and hardened stems endure several degrees of frost, as was evidenced at San Jacinto, where it was planted near a water trough during September and by January 1 had grown eight feet tall. Ice had formed on the water trough; only the foliage of the Napier was damaged. The stems were yet green and the crowns uninjured. This was proven on land south of Bolsa, Orange County.

How to plant:

Single eye cuttings are planted with very little difficulty. The operation of preparing it provides a sharp joint at the lower end of the cutting, and this is simply thrust obliquely into the ground, covering the joint to a depth of four or five inches. With canes in good condition and other factors favorable, both roots and sprouts will be sent out from the single joint and a good vigorous plant soon established.

One joint planted during April will grow as many as 20 or more sprouts that may be separated July 1 and planted separately, so that by October 1 the original joint may be multiplied by 400. We advise that no subdivision be made after October 1, but let the crown remain undisturbed until the following April, when each one will again produce 20 or more divisions besides many joints. Thus one joint within 12 months will produce more than 8,000 plants. This is a conservative estimate.

Table comparing composition of green Napier grass with corn and sorghum. Taken from Bulletin 153, Florida experiment station:

Nutrients.	Percent Corn	Sorghum	Napier
Water	78.1	75.1	85.84
Ash	1.2	1.4	2.68
Protein	1.9	1.5	2.58
Carbohydrates	13.00	14.0	14.13
Fat	.6	1.0	.53
Fiber	5.2	7.0	13.24

Napier Grass
Picture at left is No. 1; other is No. 2 as referred to in Mr. Musser's article.

Mr. Musser is also authority for the statement that Rhodes grass may now be seen growing luxuriantly in the Imperial Valley on soil so strong with black alkali that no other crop would grow.

It would seem that stockmen who have alkaline soil going to waste should investigate the possibility of

growing Rhodes grass. This grass is drouth resistant to a remarkable degree and survives our Southern California winters; recovers quickly and grows luxuriantly throughout the summer; cures to an excellent quality of hay and affords abundant pasture.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards six times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Suphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 220 POUNDS PER ACRE of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR — or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6, 7 and 8.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

WILL WE HOLD?

A United States consular report from Argentina on "Manufacture of Acids in Argentina," after an account of several, adds:

"Citric acid importations from France, England, Germany and Italy have averaged 132 tons yearly for the past eight years. The United States entered the field in 1914, increasing since then its proportion of the business materially. * * * Only in 1916 did the United States begin exporting tartaric acid to Argentina. * * * In addition to the foregoing acids the importations include several of minor importance, among which are included boric, carbonic, hydrofluoric and tannic. These came from Germany, France and England previous to 1916. Since then a small but increasing percentage of all but carbonic acid was furnished by the United States. * * * The United States furnished less than one per cent of alum up to 1915, but in that year jumped into first place with over 50 per cent, a place which it still holds. * * * The demand for aluminum sulphate maintains its average for the last 12 years of 1,155 tons. Since 1915 about 95 per cent has come from the United States, although previous to that date our exports to Argentina did not amount to five tons a year."

JERSEY POTATO CULTURE

The director of fruit and vegetable supplies at the ministry of food, London, England, thus describes potato growing methods on the island of Jersey:

In Jersey potato growers secure all their seed from their own stocks by digging up the most green and vigorous plants when the potatoes have reached about three-quarters growth. These potatoes are then put in boxes and left in the sun until they get thoroughly green and hard, when they are put away in a shed where they will be secure from frost for the winter. The potatoes are examined about every ten days and prevented from growing sprouts more than one-fourth inch in length by being given more air or being moved into a cooler position.

Early varieties can be planted early in March; late varieties at the end of March or beginning of April. By getting these potatoes green and hard in the sun when planted, wireworm and other pests will be avoided and the potatoes will be much stronger to resist frost and damp. The grower who carried out these instructions will increase his crop by at least 30 per cent.

IN KINGS COUNTY

More than a million dollars increase is shown in the returns to fruit growers of Kings County in 1920 over 1919, according to the annual report of L. O. Haupt, county horticultural commissioner.

The total for 1920 was $7,355,653, as against $6,258,810 in 1919. Grapes led with a total value of $4,615,726, of which, $2,813,100 was for raisins, $1,432,906 for fresh shipments and $369,720 for wine grapes. Peaches, canned, dried and shipped fresh, yielded $1,776,477; apricots, $778,290; prunes, $168,000; and plums, $17,160.

The apricot crop was only 60 per cent of that of 1919 and the prune and plum crops much lighter, with grapes and peaches about equal, the increased return being due to the uniformly higher prices received.

DRIED STRAWBERRIES

A method of obtaining strawberries as a dried fruit has been worked out by an English government plant and has yielded good results. The product, which has the appearance of a small reddish fig and the consistency of raisins or sultanas, retains the strawberry flavor and differs from a fresh strawberry in the same sense as the raisin differs from the grape. The product keeps well, is not attacked by molds, and is one-quarter to one-fifth the weight of the fresh fruit.

FAGEOL

WALKING TRACTOR

Beyond its unusual advantage in positive traction without slippage or soil packing and its definite dust protection, this tractor is so simple in design and so strongly built that there is little breakage, and it can be depended upon to work steadily through more days of continuous service.

An annual inexpensive between seasons overhaul will keep it in shape.

Use a Planet Jr. and more acreage

With a Planet Jr. you can work faster and better than by the old methods, increasing your acreage and growing many times larger crops.

The secret of this efficiency lies in construction, the result of many years spent in study and experiment. During the half century since the first Planet Jr. was made, hundreds of improvements have been added, each one making the labor lighter or the work more thorough.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Pecan

Could a pecan be grafted upon an almond tree? If not, what kinds of fruit could be grafted on it?—Subscriber, Eagle Rock.

No, the almond is of the peach family and the pecan of the hickory, two entirely different trees. The almond and the peach are practically the only fruit budded on almond stock. It is a physical possibility to bud the apricot and other stone fruits. However, if the subscriber contemplates working over an old almond orchard we believe he will find it more economical, or at least vastly more satisfactory, to uproot the trees and plant new. Working over an old orchard is work for an expert.

Effect of Saltpeter on Stumps

I read in the Cultivator that saltpeter is used to destroy stumps and wish to know just what effect saltpeter will have on sycamore stumps that are being cut this month and next. How long before they can be burned and how much saltpeter should be used in stumps of various sizes?—Subscriber, Hamilton City.

Saltpeter will not hasten but retard decay of stumps. Its only effect is to make more combustible, and this is done through its absorption by the wood. To hasten this after the auger holes are filled with the saltpeter water may be added, which should be renewed occasionally. It has been asserted that if this absorption is complete the stumps will ultimately, when fired, be consumed to the tips of the larger roots.

Liquid Fertilizer

What is the analysis of liquid horse manure and how does it compare with the manure in solid form? — Subscriber, Santa Ana.

More than half of the potential fertilizing value of manure is usually considered to be contained in liquids, hence the practice of using plenty of absorbents to save this valuable portion of the cleanings from stables. However, there seems to be no table showing analysis of the solid and liquid portions of manure, for their greater value lies in the two being used together. Weir's "Productive Soils" says: "Of the total amounts of the fertilizing elements contained in manure, about one-half of the nitrogen and 60 per cent of the potassium are found in the liquid excrement. Thus, the liquid manure is practically as valuable in fertilizing elements as the solid. This fact emphasizes the need of suitable absorbents to take up and conserve this valuable fertilizing material."

Milo for Dairy Feed

Does milo when fed as a fodder with pumpkins made a good feed for a milk cow?—Subscriber, Santa Ana.

This would not make an ideal balanced ration as neither of these feeds are rich in protein, one of the essentials in milk production. Alfalfa added would increase the value and in case of lack of alfalfa bran, cotton seed meal or similar concentrates should be fed.

Raspberries

In the wash back of my place is a bench three feet above the bed of the stream and six feet below the top of the bank. The water does not reach so far as that except in such years as 1914. It is 30 feet wide. I wish to plant to either raspberries or blackberries if advisable. It is protected from the cold west winds and I would wish to choose for earliness. I would prefer raspberries other things being equal. I don't want any trailing varieties. It is good soil, not gravel. It is as much to prevent any further washing as anything else.—Subscriber.

Berries or other small fruits will not make as good soil binder as will the giant reed or some other plants which are of no particular value. But as to variety of raspberry the Cuthbert or St. Regis, especially the latter, have given excellent returns. The St. Regis is recommended particularly because of its bearing two crops on the same wood. That is, plants set in the spring will make a summer growth and give a late fall crop and the same wood comes on with the regular spring crop and at the same time makes new growth for another fall. The earliest of blackberries is perhaps the one known as Gardena Dewberry. Other good varieties are the Himalaya and Mammoth.

Misrepresentation

I bought a cow from a man, he representing that she gave two gallons of milk a day, which she does not. He also told me that she would calve in three months. The fourth day I had her I found out she was not in calf. Can I get my money back and return the cow to him?—Subscriber, Fresno.

Quite plainly you have claim for return of your money, that is, providing the facts as stated can be proved to the court, and in addition, the man from whom you purchased is a responsible party.

Curing Hams and Bacon

Will you please give us the best method of home curing hams and bacon?—Subscriber, El Monte.

This question is best answered by an article appearing in the Cultivator of November 27 on household page.

Grapes

Would you give me some information on grapes, as to the kinds, care, amount of cultivation and irrigation in the Fallbrook district, etc.?—Subscriber, Fallbrook.

The first suggestion would be to decide on the type of grapes, whether table, raisin or wine, then investigate as to which variety has done best in that portion of San Diego County. In addition plant varieties with reference to your own market demands. Once the variety is settled upon, bulletins might be secured from the State Experiment Station, College of Agriculture, Berkeley; also a fund of information from catalogs of nurserymen as to culture and difficulties. Specific questions would be gladly attended to in this department of the California Cultivator. The Department of Agriculture, Washington, D. C., has published several bulletins on grapes and their diseases. A request to the department would secure a list of these publications. Cultivator articles which will be of particular value along this line are those written by Fred K. Howard, especially the two entitled "Planning and Planting a Vineyard," appearing in the Cultivators of November 6, 1920, and December 11, 1920. These give an excellent outline of general cultural methods.

California Horse Breeders' Association, Los Angeles, October 30 to November 5.

Salt Grass

What is best method of killing salt grass other than continually plowing the ground?—Subscriber, Willowbrook.

The plow, cultivator and hoe are by far the best implements for weed control. We know of no successful chemical cure for weeds which does not at the same time, at least for the time being, destroy the soil for other crops. A measure of success has been secured where arsenite and other sprays have been applied, but knowledge must be had as to condition of plants and of weather to secure complete success. The planting of sugar beets, beans and other crops calling for clean culture will succeed best for cleaning up foul ground.

Sweet Potato Plants

Please give information as to growing sweet potato plants.—Subscriber, Madera.

This question is fully answered in an article which appears on another page of this issue, which is really a reprint from a former Cultivator, but is timely and contains very complete information on this topic.

Spraying Trees

What is best time to spray trees and best fluid to spray with?—Subscriber, Willowbrook.

The best answer to this question is given by the California Caltivator of August 9, 1919, which gives nearly half a hundred formulas for spraying all kinds of fruits in different sections, for instance, apples, pears and quinces in one section, under which there are an even score of suggestions for handling insect pest or fungoid and bacterial diseases. More general information on spraying trees cannot be given without knowledge of needs and variety of trees.

Unsatisfactory egg yields, low fertility, poor hatches, slow growth and development of the young stock, and many of the most troublesome poultry diseases are often due primarily to improperly located and poorly constructed poultry houses.

A new Fresno County cow testing association plans membership not to exceed 800 cows, this in order to render better service. Tuberculin testing is a feature of the association's work.

GOOD FRIENDS AND BAD

When your back's to the wall and you've
no hole to crawl
Within, and must win out or perish;
When you've broken your lance, but still
cling to the chance
To battle for all that you cherish,
Then it is that you feel what can hurt
worse than steel,
From the friends who withdraw from
you, sighing:
"We must wash our hands, lad, of a
muddle so bad—
Don't you see you were foolish for
trying?"

Yet, if one in the crowd comes to tell
you: "I'm proud
Of the courage you've shown, and the
chances
You take; I don't care for a man who
won't dare
For his honor to break a few lances.
It is worth a hard fight—which you're
making, all right—
So here's a fresh lance you may win
with."
You've more courage, more pride—and
more friendship, beside,
Than ever you had to begin with.

Oh, the worst friends there are (and,
alas, they are far
From scarce) are the ones timid-hearted
Who shout, when your place is far back
in the race:
"Drop out. You should never have
started."
And the best are the few who are proudest of you
When your heart proves more strong
than your sinew,
When, though running behind and though
staggering blind,
You still give the best that is in you.
—Lee Shippey in L. A. Times.

OVER HER LEFT SHOULDER

(Concluded.)

"Well, dear, we shall have to give it up for tonight. It is time for you to go to bed. Let us hope that it will come to light tomorrow."

The collie still continued to bark and jump, but his mistress was in no mood for play. She searched for the morning paper and it could not be found! "Isn't that too bad?" she exclaimed crossly and looked reproachfully at Ned as though it was his fault.

She knew that the sensible thing was to go to bed and forget the storm and all suggestions of trouble, but she decided to sit up for her husband. Perhaps he was waiting in town to see the owner of the forty on the other side of the meadow, that they wished to buy. But why couldn't he have started home before the storm?

The rain poured down harder, blowing in sheets against the windows. Every few minutes the thunder boomed heavily. Dora began to be thoroughly frightened. She crouched down in Henry's easy chair with her hands over her ears, but even then she could feel the jar of the storm. Around the drawn window shades the lightning played like a frame of fire.

Ned raised his head and walked slowly to the door to listen. Growling, he lay down, with his nose pointed straight at the threshold. His ears quivered, his tail moved back and forth heavily, he held himself keenly at attention.

Dora finally took herself in hand and went to the back of the house to make sure that all windows were closed against the rain. When she returned, Ned was still motionless, listening.

"Good dog, good old Ned!" she said. "If anything should happen, you and I are the only ones to take care of the stock and the house and the children!"

Ned beat his tail sympathetically. He was on guard, he said to her in dog language.

"Cr-cr-crash!" That terrible thunder again! Dora held fast to the door frame to keep from trembling. Then after a moment she said aloud, "I am going to make myself go to that window and look out!" What would Henry say if he knew that I was afraid like this?" As she drew the shade aside, lightning flashed a vivid, forked sign like fiery handwriting across the black of night. Dora gave a little scream and darted away from the window, covering her eyes with her arm as the thunder, louder than ever, followed the flash. "That struck near us!" she gasped. She was walking up and down the room now, her hands clasping each other until the knuckles were white. "Bad luck, bad luck for us!" she whispered with pale lips.

Ned lay motionless by the threshold, following with loving eyes his mistress's every anxious step. Suddenly she stopped beside him and exclaimed, "Oh, it is bad to be scarred! Do you hear, Ned? I do not want to be afraid. I am ashamed of myself." And then, gathering herself together, "I am not going to be afraid! I will not!"

Ned thumped his tail and continued his watch.

Somehow, just saying those words made Dora feel braver, and at the next clap of thunder she clasped her hands together so that she could not clasp them over her ears. Then she went to each window and rolled up the shades. "There, you can stay up!" she declared. She had come to the point where, though still afraid, she was compelling herself to act bravely. In spite of herself, she was fascinated by the majesty of the storm seen through the unshaded windows.

"I believe that when you face things you are afraid of, you are not nearly as frightened as when you try to hide," she said, speaking aloud to the dog.

He beat his tail in answer, then rising slowly, gave a quick, low growl and backed a few paces away from the threshold. The next minute there was a loud pounding on the door, someone vigorously rattled the door knob and a strange man burst into the room.

"Hey, call off your dog, lady!" he shouted, as he shoved the door shut against wind and rain. "I'm a respectable traveler, ma'am, but in a storm like this you would have to let any villain in! I thought each one of those bolts would be the last of me. Terrific!"

The intruder was an elderly man with jolly blue eyes and a ruddy countenance. Water ran down from his hat and overcoat in streams, and settled in puddles on the rug. He went right on talking without waiting for an answer, mopping his face with a large handkerchief.

"Say, it was a good thing when you threw up those window shades. Steadied me, you know, out there in the dark. My car was jumping. Couldn't keep the road. I am on my way to Mr. Benton's place. Can you tell me how far I have to go?"

"Mr. Benton's place! This is Mr. Bentons place. I expect my husband home any minute."

Even as she spoke, the door was thrust open a second time and Henry nearly knocked the stranger over as he literally flew in before the impact of the storm.

"Hello, there!" he said in astonishment. "Who—who are you?"

"My name is Stevens!"

"Well! Well! I have been all this evening at Deer Creek looking for you. Heard you were due there."

"And I have been in Centerville, ten miles away. Thought I wouldn't go home without seeing you about that land. Said I would drive out, storm or no storm, and here I am. Didn't know this was your place. Blew in!"

"This is my wife, Mr. Stevens. How about supper, Dora? Perhaps Mr. Stevens will have some with me."

"Sounds good to me," answered the visitor, "if it is not too much trouble, Mrs. Benton."

A little later Henry followed Dora into the kitchen and whispered gleefully as she poured the steaming coffee, "Good luck, little woman! We closed the deal. The old gentleman is going to California to live and is anxious to wind up his affairs. He held out for more than I offered, but then he came down a little and I guess we can manage. And I can get a whopping crop off that land next summer!"

It was good luck, after all! Henry was home safe and sound. The storm was over. It had blown the owner of the land right to their door and now they were assured of the wish of their hearts. Dora knew just how much difference that extra piece of land would make in their year's receipts.

After supper, Henry escorted Mr. Stevens out to his car, gave him minute directions as to turns, short cuts and bad stretches of road, and in a trice the little man was gone.

"I am going to take a look at the attic roof," he announced upon coming back to the house. "I shouldn't be at all surprised if it were leaking,

The Cultivator Patterns

BE SURE TO SEND SIZE

3472. A Simple Chemise Dress.—Cut in three sizes: 16, 18 and 20 years. A 16 year size will require 4 yards of 44 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

2990. Child's Dress.—Cut in five sizes: 2, 4, 6, 8 and 10 years. Size 6 requires 2½ yards of 36 inch material. Price 10 cents.

3049. Ladies Cover All Apron. — Cut in four sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. Size Medium requires 4⅝ yards of 36 inch material. Price 10 cents.

3467. Girl's Coat.—Cut in four sizes: 4, 6, 8 and 10 years. A 6 year size will require 4 yards of 27 inch material. Price 10 cents.

3471. A Pretty Dress.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The width of the skirt at lower edge is 2 yards. A 38 inch size will require 4⅝ yards of 44 inch material. Price 10 cents.

3491. Girl's Dress.—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 3⅞ yards of 38 inch material. Price 10 cents.

3469. Dress for Breakfast or Service.—Cut in four sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. The width of the skirt at the foot is 2 yards. It will require 7⅜ yards of 27 inch material for a Medium size. Price 10 cents.

3470. Girl's Dress.—Cut in four sizes: 4, 6, 8 and 10 years. A 6 year size will require 2¾ yards of 36 inch material. Price 10 cents.

after all this downpour." He lifted a hand lamp from the hall table and disappeared up the red carpeted stairway.

Dora passed lightly back and forth from dining room to kitchen, softly singing as she cleared away the dishes. "Oh, I am glad that Henry is home—I am glad that Henry is home. Everything is all right now—and it was good luck after all!" she chanted below her breath. Once she stopped by the great chimney that went up between the living room and the dining room and listened to a rhythmical drip-drip, drip-drip, and could hear Henry as he set heavy crocks to catch the water.

"We'll have to have new shingles pretty soon," he said, returning to the cosy room. "Perhaps next year we shall be able to afford it. Here is what is left of the morning's paper," he continued. "I found it up in the attic. The children must have taken it by mistake for wrapping apples."

As he handed Dora the paper, a yellow envelope fell from its folds. The lost letter! For a moment as she held it in her hand the shadow of bad luck fell once more athwart her thoughts. Perhaps it contained unhappy news. "It is Cousin Ella's handwriting," she said, "Aunt Martha's daughter. I have not heard from her in ages."

"Well, what does she say?" laughed Henry. "You will never know unless you open it."

This is what she read:

Dear Cousin Dora: Do you know anything about a gold and enamel locket with the initials A. L. W. in blue on the back? I know those were Aunt Alice's initials—your mother's.

We have been changing the old place considerably of late. The latest improvement is a new stone bridge across the brook that runs through the pasture. In digging through the sand and stones to the supports, one of the workmen found this beautiful locket. I have polished it up and really it is hardly hurt at all. It must have been wonderfully well made. The workmanship is exquisite and I consider it a real treasure. Cannot you and all your family come down and see it at Thanksgiving time? If it is yours we shall be glad.

Drive down the day before and let us have a regular, old time family reunion on Thanksgiving. I am giving you notice far enough ahead so that I am sure you can come. It will be so good to see you again. Do not disappoint us, please.

Affectionately yours, Ella.

Dora lay back in her chair for a few minutes without speaking. Then she said solemnly, "Henry! The next time I see an omen that I think means bad luck I am going to get ready for double good luck instead. I have had a lesson tonight. I wish I could tell Aunt Martha."

And then she told him the full story of her superstitious fears and useless suffering, all because she saw the good old moon over her left shoulder. And Henry laughed.

THIS WEEK'S PATTERNS

With the coming of the green on hills and fields come plans for repainting and repapering the home and making new clothes for the spring and summer. "I'm going to get all our summer clothes made this month," announced a capable young matron, "so that next month I can get busy in the garden. There is so much I want to do that I'm planning way ahead." And she went on to describe hers and her two little girls' wardrobes for next summer. By the way, she makes all her husband's shirts, too, and in addition is planning a campaign of painting and tinting and scraping and smoothing floors that sounds very ambitious, but she happens to be one of the people who carries out her plans.

She is now getting cotton materials for the little girls' school dresses. One likes blue; the other pinks and browns. So those are the colors she chooses and the youngsters love the dainty simple dresses she makes. She seriously studies the fashion sheets and the store windows and adds to each little dress an individual touch especially becoming to the wearer.

This department often mentions Devonshires and similar materials for children's clothes, and it is pleasant to note now that these useful materials are descending in price, along with ginghams and percales. Men's shirtings are also excellent for children's clothes and are very often to be had more reasonably than ginghams.

The children's dresses shown this week are all practical and dainty as well. Nothing could be simpler than the litle girl's dress 3470 developed in a pink sprigged percale, and let us suggest as a dainty touch a plain white collar instead of one of the material. 3491 is a style that gives opportunity for dainty additions of lace trimming that any little girl will love. The little apron front is an unusual touch and the whole dress is so simply made that it may easily be kept fresh and crisp.

3471 is an unusually stunning gown with long straight lines, the new rolling collar and attractive touches of embroidery. The braiding of skirt, collar, sleeves and basque like front is quickly done and gives a tailored finish.

HINTS FROM HOUSEKEPERS

I am sending a recipe for use of old bread crumbs that is a decided change from bread pudding. It is very nice and so good for "farmer ladies" like myself when one can't get mince meat. It is better served hot but is equally good cold. This is enough for two pies:

One cup bread crumbs, 1 cup sugar (brown or white), 1 cup molasses, (any kind) ½ cup vinegar. To this add ½ cup boiling water and large piece of butter, and 1 cup of raisins and currants mixed or either separate, ½ teaspoon nutmeg, cinnamon, allspice, and cloves, 3 or 4 tablespoons flour.

Mix hot water and vinegar add butter and crumbs, then raisins or currants then molasses. Mix flour, sugar and spices and add to above. Cook slowly for 20 or 30 minutes or until you are ready for same.

This is a delicious crust for hot pies, or when one wants one in a hurry: 2¾ cups flour, 1 cup shortening (generous cup), ¾ cup boiling water, ½ teaspoon salt, 1 teaspoon sugar. Mix as any crust and roll.—Mrs. Camp, Corona.

HOUSEHOLD QUERIES

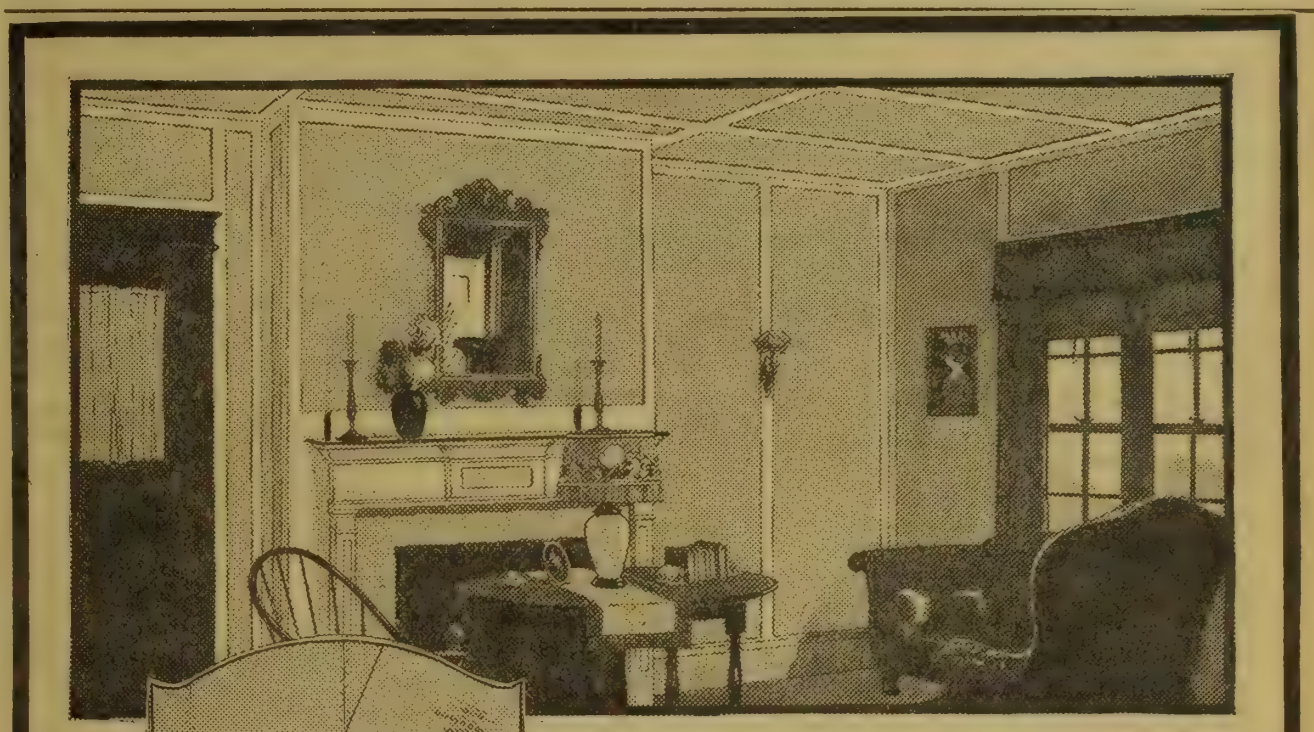
Home Made Yeast

We have inquiry from a mountain subscriber as to best way of making and keeping home made yeast. She expects to use the dry yeast in making her potato yeast starter and asks Cultivator readers who are experienced bread makers to give their best advice. The Cultivator will be glad to extend subscription credit for hints along this line and others of practical help.

Rancid Lard

In your household department please tell me how to sweeten lard that has become rancid. I bought 20 pounds at 40 cents a pound and do not like to lose it.—Subscriber, Napa.

This also we turn over for answer to our practical housekeepers. What can you suggest other than heating and storing in a cool place?



The Mark of Better Walls and Ceilings

It's no longer necessary for you to live with unsightly wall paper and cracked plaster. You can completely cover them up. You can have new walls and ceilings that will never need replacing. You can do these good things yourself, and do them EASILY.

Look at the pictures on this page. The small one shows how easily the big flawless panels of Beaver Board are placed over the old worn wall and how they cover up the old surfaces entirely. The larger picture shows the result you can expect and the "Beaver Quality" trademark is the symbol by which you can be sure you are getting genuine Beaver Board.

The next time you are in town visit the Beaver Board dealer. Let him show you the big flawless panels of Beaver Board—all ready to use on your walls and ceilings. He will tell you all about this "Do-it-yourself Way" to renew the old home or build everlasting walls and ceilings in the new home. Ask about Beavertone, a velvety flat wall paint especially made for Beaver Board in a variety of beautiful colors.

If you cannot locate the Beaver Board dealer write to the nearest of the District Sales Offices listed below.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Blue Sky Law

What is meant by "Blue Sky Law"?—Subscriber, San Jose.

"Blue Sky Law" is the colloquial term for an act known as the Investment Companies Act, creating the office of corporation commissioner. Briefly, under this law all corporations desiring to sell stock in this state and all stock salesmen are required to submit to the jurisdiction of the corporation commissioner and obtain permits from him, in order to carry on their business.

Ditch Right

My grantor owned 80 acres of land and made irrigation ditches throughout to suit his convenience. He thereafter sold 40 acres to one party and the other 40 to me. A ditch for the irrigation of the first 40 meanders through my property, commencing and ending within the first 40. Since the acquisition of the property, the owner of the first 40 has installed a pumping plant and regularly runs the water therefrom through this ditch. In order to irrigate ten acres of my land it is necessary for me to use this ditch also, and if I have not the use thereof I cannot so irrigate. What period of time is necessary to give him a right to run his water? Can my neighbor take water over my land when I wish to irrigate? If he has not acquired rights, how can I prevent his using the ditch?—Subscriber, Bakersfield.

When an owner of an entire tract of land employs a part thereof so that one derives from the other a benefit of a continuous nature and divides this land into two portions, selling to different persons, the respective grantees will take the portions granted to them, burdened or benefited, as the case may be, by those rights in the nature of an apparent and continuous easement, which the prévious owner had the right to attach. Under this rule the owner of the first 40 undoubtedly has the right to run the water from the irrigation ditches through the ditch running over the second owner's land, but he has this right only for such periods and in such way as it was customary for the former owner to use this ditch for that purpose. It is certain that he passed to his grantee no right for the general use of the ditch for continuous irrigation from pumps, as such pumps had not been installed. The right of way being in derogation of the rights of the second grantee, must be construed strictly to that which prevailed at the time of the grant. However, if the use of these ditches for pumped water has continued for five years openly, adversely, and under claim of right, the owner of the first parcel would doubtless have procured a right by prescription. If he has not acquired such right, the owner of the second parcel would be entitled to install a gate or gates at the boundaries of his premises and shut off the ditch from use for the water issuing from the pumps, as the action of the first owner in sending pumped water through the ditch would probably be a simple act of trespass. It would be well, at the same time, to give the first owner notice that the installation of the gates was without prejudice for the use of the ditch for irrigation water at the times and by the means which were customary under the ownership of the original grantor.

Irrigation District Expenditures

Has the board of directors of an irrigation district the right to overdraw and spend any large amount of the taxpayers' money without taking the matter up with the taxpayers? If they cannot, what recourse have the taxpayers?—Subscriber, Escalon.

Upon the organization of an irrigation district the directors are authorized to expend for the purposes of organization not to exceed one-half as many dollars as there are acres of land in the district and may cause warrants for such expenditure to be issued, payable not later than the first of January after the assessment. For all other contracts in excess of $10,000 for emergency indebtedness the board of directors must procure the assent of the majority of the owners within the district. They do have the right to acquire land, water rights and property necessary for the construction and maintenance of canals and works up to the amount of $10,000 without the previous assent of the land owners. Expenditures in excess of the amounts permitted by the law are by the law held to be void. The party protesting against such illegal expenditures would doubtless be entitled to hold the directors personally liable and would be entitled to bring action to have such expenditures declared unlawful and possibly recover the amounts from the parties to or by whom they were made and also would have the right to petition for an election for the recall of the offending directors. It would be necessary in such a case to consider the exact facts before deciding upon the most appropriate remedy to be used.

Transportation of School Children

Is there a law requiring school districts to furnish transportation for children to and from school?—Subscriber, Simmler.

It is the duty of school trustees with the approval of the superintendent of schools to provide for the transportation of pupils to and from school when in their judgment such transportation is advisable and good reasons therefor exist, and, in pursuance with that duty, to purchase or provide for the operation of vehicles or contract for the transportation of pupils by bid in the usual method of bidding for all school supplies.

"Co-operation is born of Desperate Necessity"

These are the words of G. Harold Powell, head of the oldest and the greatest of our wonderful California co-operative marketing associations; the

CALIFORNIA FRUIT GROWERS EXCHANGE

was born of desperate need of the Orange Growers of Southern California faced with bankruptcy in the marketing of 5000 cars of citrus fruits. Today their annual sales amount to 50,000 cars valued at $75,000,000.

Raisins were bringing 1¾c to 2½c. Vineyards were worthless. Fresno business houses and banks were unable to realize on the growers' accounts and mortgages. Today the

CALIFORNIA ASSOCIATED RAISIN COMPANY

markets a crop three times that of seven years ago at 15c per pound and Fresno is one of the most prosperous and progressive cities in our broad land.

Santa Clara Valley orchards, famed for their luscious prunes and golden apricots, are selling at $2000 an acre. Four years of successful co-operative marketing by the

CALIFORNIA PRUNE & APRICOT GROWERS

is the reason for this wonderful prosperity.

But what of the great Canning Fruit Industry? Today fully five million cases of the choicest fruit, packed by scientific methods in sanitary factories, remain unsold in the warehouses of the commercial canneries. With tremendous new acreages of fruit coming into bearing, with a production three times that of previous years, the canning industry faces demoralized markets. The canneries are suffering staggering losses on the past season's operations and you, Mr. Peach Grower, you, Mr. Grower of Pears, Cherries, Plums, Apricots, Asparagus, etc., will pay the price, unless—

Well, do you intend to stand by quietly, allow your orchards to be fertilized by thousands of tons of perfect fruit, while Europe, China and the rest of the world starves, or—

Do you intend to take charge of your own business, build your own markets and turn your *Desperate Necessity* into your *Co-operative Salvation?*

It will require the united efforts of the growers of canning fruit to finish this job which we have started. A card addressed to Box G, San Jose, California, will bring full information.

CALIFORNIA CO-OPERATIVE CANNERIES

Owned and Operated by the Growers of California

Main Office, San Jose, Cal.

120-1

STATE DAIRY COW COMPETITION FOR DECEMBER

THE prize for the highest production of butter fat by five grade cows entered in the state dairy cow competition for the month of December was won by Earl Graham of Compton, for an average production of 75.96 pounds of butter fat per cow, and the California Cultivator prize for this month was therefore awarded to him.

The production of the individual grades for the month was as follows:

Name	Age, yrs.	Days in Milk	Milk	Butter Fat Pct.	Butter Fat Lbs.	Butter Fat Credit
Peg	4-	29	2241	4.1	91.88	105.66
Tomie	4-	33	2275	3.6	81.90	94.19
Spot White	.. -	49	2331	3.2	74.59	74.59
Emma	6-	5	1866	3.6	67.18	67.18
Mousie	3-6	38	1947	3.3	64.25	75.82
		31	2112		75.96	83.49

This is the second time that grades owned by Mr. Graham have won this prize for him. Other groups of five cows, eligible for competing for the prize, produced on the average as follows:

Napa State Hospital, Napa, 71.47 pounds; L. A. County Farm, Hondo, 62.48 pounds, (credit 72.18 pounds); F. F. Pelissier, Whittier, 63.17 pounds; C. E. Fisher, Hughson, 46.01 pounds (credit 52.97 pounds); J. M. Christen, Pacheco, 47.91 pounds (credit 50.35 pounds).

The summary figures for the month for all cows in the competition, for which reports have been received at this writing, are: 1.042 pounds milk, 53.3 pounds butter fat, equivalent to over 2 pounds of commercial butter per head daily. So far, about 250 cows have been entered in the competition, owned by 34 different dairy farmers or breeders. Professor Woll of the University of California, Berkely, reports that entries are still open, and necessary blanks and further information concerning the competition will be furnished promptly upon request.

(Detailed report of production of 20 best individuals for December next week.)

REVADA GUERNSEYS AVERAGE $268

The first public dispersal sale of Guernseys ever held in California occurred January 20 when the entire herd owned by the Mission Land and Cattle Company, Yountville, was sold. This herd was the remnant of what was once regarded as one of the top herds owned in America. At the time the herd was established by B. E Nixon no expense was spared in securing cattle from the top herds of this country as well as the Island of Guernsey. After several years of operation the former owner turned to other interests and from time to time sold off many of the choicer members of the herd. Finally the Revada Ranch and herd was sold to the Mission Land and Cattle Company. This concern, having other plans for the ranch, decided to close out the complete herd.

The sale attracted wide attention throughout the West and many of the leading breeders were present. The list of buyers serves best to indicate the widespread interest in this breed, the cattle going to herds from Humboldt County to San Diego County. Another feature of the sale was the widespread and active demand for bulls, 15 bulls selling for an average of $238.

Walter H. Dupee of Santee was the heaviest buyer of the better things. Chas. Maurer, representing A. B. Humphrey of Escalon, was a close second. Other prominent buyers were: C. S. Rasmussen of Loleta, Wm. H. Saylor of San Francisco; Inglewood High School, Inglewood; W. H. Rapson of Corona and W. F. LaGrange of Inverness.

The top bull was taken by W. H. Dupee and the top female, Imp. Golden Wish of Revada, by C. E. Potter of Shellville.

The sale was generally regarded as satisfactory in view of the fact that none of the individuals had been given records; none of the young things were from tested dams. An unfortunate feature of the sale was the fact that most of the imported cows had reacted to the tuberculin test and were sold as reactors.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company. Ben A. Rhoades of Los Angeles was the auctioneer. A representative list of sales follows:

Bulls

1, Stagenhoe King of Revada, April 1919, W. H. Dupee, Santee, $625.

2, Itchen Daisy's Butter Boy of Revada, Nov. 1918, W. H. Rapson, Corona, $350.

3, Revada Golden Sun, Aug. 1917, W. F. LaGrange, Inverness, $150.

7, Henry of Revada, April 1920, Inglewood Union High School, Inglewood, $220.

9, Coming King of Revada, Oct. 1919, W. H. Saylor, San Francisco, $250.

18, Itchen Sandman of Revada, April 1920, C. S. Rasmussen, Lolita, $425.

21, King John Rose of Revada, January 1920, W. F. LaGrange, $170.

29, Golden Purity of Revada, May 1920, Louis Bidstrup, Suisun, $150.

41, King Milkman of Revada, January 1920, O. C. Struve, Napa, $180.

43, King Britannia of Revada, Nov. 1919, A. L. Hinshaw, Petaluma, $160.

48, Revada Demonstrator, June 1919, F. B. McKay, Standish, $180.

(Continued on Page 150.)

Think of the Auction Sales

Let your mind for a moment turn back to the auction sales of grade dairy cows that you have attended. What sort of cows commanded the top prices and why?

Don't you remember that the cows that were in most demand at the best prices were those that were well marked and showed plainly the black and white imprint of the Holstein breed?

And when a well marked black and white cow came into the ring with the added attraction of a cow testing association record, didn't it make considerable difference in price?

Why raise grade dairy heifers of nondescript blood that are quite certain to develop into the sort of cows that bring the low prices when sold, or become the boarders that have to be weeded out of the herd when the cow test association tester exposes them, when the very small comparative investment in a good, pure bred, registered Holstein bull will assure greater certainty in the productive ability of the heifers you raise?

SIR AAGGIE MEAD

His sire, SIR AAGGIE DE KOL ACME, by a son of Aralia De Kol and out of Aaggie Acme of Riverside 2nd, whose record of 1,331.70 lbs. butter in one year is the world's strictly official record, and she is the dam of Miss Aaggie Acme Burke, the only junior 2 year old in California that ever made over 1,000 lbs. butter in one year, her yearly milk production a world's record when made, and still second highest in class, and now on test again in our herd has 35.38 lbs. butter from over 726 lbs. milk to her credit in 7 days as a junior 4 year old. She in turn is the dam of the $41,000.00 bull King Korndyke Pontiac Acme. The first daughters of Sir Aaggie De Kol Acme to freshen are splendid producers, and as he is being used heavily in our own herd and in the herd of Mr. F. W. Kiesel, Sacramento, he is certain to have a very large list of daughters.

His dam, ARALIA DE KOL MEAD, made a strictly official record of 1,215.20 lbs. butter in one year, and she is by King Mead of Riverside out of Aralia De Kol, with 1,142.3 lbs. butter and the former world's milk record of 28,090 lbs. in one year. She is also the dam of Aralia De Kol Pontiac Mead, 932.43 lbs. butter in one year as a senior 2 year old, and 34.43 lbs. butter in 7 days as a senior 3 year old, who in turn is the dam of the $11,000.00 bull Sir Aaggie Mead De Kol, heading the Arfmann and Amos herds in New York.

The three nearest dams of SIR AAGGIE MEAD average 1,229.74 lbs. butter from 25,274.8 lbs. milk, two of them strictly official records, and his pedigree on both sides represents some of the most dependable high producing blood in our herd.

SIR AAGGIE MEAD carries a high degree of type with his rich breeding, and we have every confidence that he will add substantially to the great production records of his ancestors through his offspring.

He heads the herd of outstanding females owned by

Toyon Farm Association
Los Altos and San Francisco

We have developed a number of families whose productive and reproductive worth is well established through several generations of yearly tests.

Bulls from these families head a large percentage of the most substantial breeding herds of registered Holsteins in California, as well as a number of high class herds in other states and foreign countries.

Visit the nearest breeder to you who has at the head of his herd a bull bred by us in one of our proven families, and learn how reasonably you can add 50 per cent of real producing blood to your next crop of calves.

We have bulls for sale that are just the kind to improve grade dairy herds, at prices that make them first class investments, and we are usually in position to meet the needs of the breeder who wants a real herd header for a registered herd.

Remember that practically all of our breeding females are young, most of them still in heifer form, and every buyer of one of their sons at values based on present records will benefit through any later and larger records we may make.

Come and see our herd if possible, or write your needs if in need of a good bull at a correct price.

NEVADA HEREFORD RANCH

We always carry a large herd of high-class Herefords and at the present time we are offering:

A splendid lot of young cows with Harris Standard 2nd calves at foot, and many of them rebred.

A nice selection of young cows and heifers bred to our herd bulls.

A choice collection of open heifers.

A lot of good rugged range bulls. These are the real money making kind, and they are priced to make money for the buyers. We will sell them in car lots or in lots to suit buyers.

We also have some choice young bulls of herd-header caliber that we will sell well worth the money.

We invite your inspection.

John H. Cazier & Sons Co.

Otis Cordell, Herdsman Wells, Nevada

Our ranch is on the main line of both the S. P. and W. P. railroads and only a twenty minutes drive from Wells.

SIERRA VISTA HEREFORDS

One of the largest herds in the West. Built on a Repeater and Fairfax foundation. At present we have to offer 24 choice yearling bulls ready for service.

Sierra Vista Vineyard Co. Minturn Madera County Cal. On Highway 16 Miles South of Merced

MERRITT-BOWERS COMPANY, Tagus Ranch, Tulare, California

have just got in two carloads of registered Shorthorns and Hereford bulls, and have a large assortment of draft stallions of all breeds, work horses and mules, as well as Mammoth Jacks, Duroc-Jersey Hogs and Poland China Hogs for sale, with a guarantee on every animal.

DIAMOND G HEREFORDS

A few choice young bulls, big, heavy-boned husky fellows sired by DON PERFECT 2nd, one of the best sires in the West. Priced right and guaranteed.

H. H. Gable Esparto, Cal.

ALAMO HERD
(Founded by the Late Gov. Sparks)
Registered Herefords
Herd and range bulls reasonable. Largest Hereford Herd in California.

W. D. Duke, Gazelle, Siskiyou Co., Cal.

Use Hereford Bulls

The Hereford is the range bull without a peer.

My Herefords have size, bone, constitution and are notably thick fleshed. Visit my ranch and get my prices. Send for free literature.

At Sacramento

By R. P. Royce

The third week of the legislature was characterized by the introduction of an avalanche of bills; two plans for the reorganization of the state government and an honest-to-goodness fight that was precipitated by the proposal to increase the tax rate for corporations. This corporation measure served to bring to Sacramento a lobby that old timers say is one of the strongest that has ever been seen at the captial. After a battle of nearly a week, during which time the measure was approved by the senate, it was finally defeated in the assembly. It is certain that it will come up for reconsideration after the recess.

Governor Stephens has proposed a plan for the reorganization of the state government. In brief the plan if adopted would abolish about 90 existing commissions, boards and other offices and in their place provide for six general governmental departments as follows: finance, agriculture, education, public works, labor and professional standards. The following are the more important boards that are eliminated: State fish and game commission, state normal school boards, boards of the California Polytechnic School and School for Deaf and Blind, state purchasing agent, Carey act commission and advisory board, immigration and housing commission, state bureau of labor statistics and commissioner of this bureau; industrial welfare commission, boards of accountancy, architecture, dental examiners, embalmers, library examiners, medical examiners, optometry, pharmacy and veterinary medicine, two of the three paid civil service commissioners, state dental surgeon and children's agents.

Other agencies which are not interfered with in the governor's plan are the following: Legislative counsel bureau, superintendent of banks, insurance commissioner, building and loan commissioner, real estate commissioner, corporation commissioner, state mining bureau, industrial accident commission, state board of health, railroad commission, reclamation and irrigation boards, state board of harbor commissioners and board of charities and corrections.

The board of health and railroad commission are constitutional bodies.

A somewhat similar plan is being sponsored by the Taxpayers Association of California. The association believes that the governor's plan is not sufficiently thorough. The second plan is based on 13 departments; they are finance, agriculture, labor, harbors, public health, welfare, corrections, education, natural resources, corporations, state, institutions and public works.

A bill that has the support of the agricultural legislative committee has been introduced in both branches of the legislature looking toward the safeguarding of butter fat tests. Through the administration of the state department of agriculture manipulations of tests are prevented.

Senator W. J. Carr has introduced a bill providing for the purchase of a university farm for the use of the college of agriculture and for the development of such a farm and providing instruction for students, said farm to be located in the San Fernando Valley, Los Angeles County.

Senator Jones has introduced a bill establishing standards, grades and standard packages for fruits, nuts and vegetables sold in state and interstate markets. His bill is calculated to supersede existing legislation.

Senator Rigdon has introduced a bill calling for the establishment of a deciduous fruit and nut experiment station to be located in the Paso Robles district or in the Atascadero district.

Assemblyman Isaac Jones has a measure for the control of walnut codling moth.

Senator Breed has introduced a bill proposing a bond issue of $3,000,000, to be voted upon at the next general election, for the establishment of additional land settlement units. Preference is proposed for ex-service men.

Three other measures planned to assist ex-soldiers to acquire land in this state have been offered.

Senate bill 549 introduced by Lyon regulates the baling, ginning and storing of cotton and establishes minimum and maximum weights for bales and places the industry under the control of the department of weights and measures.

Senator Rush has a bill preventing the importation into this state of horses, mules, dairy cattle, breeding bulls, bucks and sheep which are affected with a communicable disease.

Rush also has a bill for the eradication of sheep scabies.

Senate bill No. 500 by Harris amends acts relative to coooperative, nonprofit farmers' organizations to permit the members to receive profits.

One bill has been introduced that requires all state highways to be at least 18 feet wide.

A daylight saving bill to become effective in March, 1922, has been offered.

The assembly unanimously adopted the West resolution for the appointment of a committee to investigate and report on the present status of the college of agriculture and the university farm school. The resolution was also adopted by the senate with but one dissenting vote. The resolution is generally regarded as of great importance and it is expected that the report will serve to shape the future development of the college of agriculture along lines calculated to correct many of the present faults.

Senator Slater has introduced a bill appropriating the sum of $5,000 for the fourth district agricultural fair.

The proposed plan for placing a tax of one cent a gallon on gasoline is meeting with considerable opposition from farmers who own tractors.

Dennett has introduced a bill empowering county fire insurance companies to form reinsurance companies.

FRESNO COUNTY POLAND CHINA BREEDERS' SALE

The Poland China breeders of Fresno County held their annual consignment sale of bred sows and gilts at Fresno, Wednesday, January 19. Although there was more interest manifested by the local trade and the heaviest demand for catalogs of any sale held by the county association, still an all day's rain evidently discouraged the crowd and kept most of them away. Col. Fred Gatewood worked hard on the block but everything was against him. It was hardly possible to sell the entire offering. The sows and gilts sold brought an average of $60 per head. The top of the sale was No. 19, a choice gilt by Liberty Bond, consigned by A. Buckland & Son. She was purchased by Bassett Bros., Hanford, at $100. H. A. Johansen, Fresno, was the heaviest buyer, taking four of the best sows in the sale.

It is doubtful economy to build a silo within another structure, for it amounts to paying for the space twice. It would be more aconomical in the long run to use durable materials, paint, or treat it with some good preservative, and provide a roof for protection.

Milk should be served to children at every meal. If a child does not care to drink raw milk, it should be prepared in some manner to tempt the appetite.

GREAT MORRIS HEIFER MAKING SPLENDID RECORD

Miss Aaggie Acme Burke, the noted Holstein-Friesian heifer owned by A. W. Morris & Sons Corporation, Woodland, whose records have been referred to in our recent issues, has apparently reached her best seven day production, and now has to her credit 35.38 pounds butter in seven days from over 726 pounds milk as a junior four year old with second calf.

Miss Aaggie Acme Burke

This great heifer is not only a high class individual, as her picture shows, but is also of royal breeding. She is by Segis Pontiac De Kol Burke, son of the former world's record cow Riverside Sadie De Kol Burke, and is out of Aaggie Acme of Riverside 2nd, whose record of 1,331.70 pounds butter in one year is the world's strictly official record. Curiously enough this heifer has made exactly the same seven day record as her dam, even to the fraction of a pound, 35.38.

As a junior two year old with first calf, Miss Aaggie Acme Burke made 1,034.44 pounds buter from 24,338.8 pounds milk in one year, her butter record being third highest in class, and her milk production a world's record when made, and still second highest in class.

She is the dam of King Korndyke Pontiac Acme, the outstanding young bull purchased by Anita M. Baldwin in the St. Paul sale last year for $41,000, and who was junior champion at California State Fair and Los Angeles Livestock Show in 1920.

Miss Aaggie Acme Burke dropped a fine heifer calf by Sir Aaggie De Kol Acme at this freshening, and is starting off at a wonderful clip, holding well over 100 pounds milk per day.

California Duroc Breeders Association Consignment Sale

Davis, Cal., Saturday, Feb. 5th 1921

An offering that will increase the profits from your farm. We appeal to both the farmer and breeder.

This consigmnent of

THERE IS NO BETTER BLOOD IN THE COUNTRY

— ALSO —

A Few Fine Boars for Sale at Private Treaty

Send to Thos. T. Dinsmore, Manager
O U R Ranch—Santa Barbara, Cal.
for Catalogs

NOTE: California Farmers have been slow to realize that the packers and butchers all over the country will pay more for Hampshire Hogs than for those of any other breed and incidentally the Hampshires have won the blue ribbon of hogdom, namely, the Championship in car load lots at the Chicago International Livestock Show in 1918, 1919 and 1920—and in the last two years the Reserve Championship as well. Such a record requires no comments.

In the Cornbelt States and through the South, hundreds of breeders identified for years with other well known breeds are now breeding Hampshires only, because they find them the best money makers.

The unprejudiced man who wishes to breed only the best can easily satisfy himself by growing a good Hampshire Sow and her progeny under equal conditions with a good sow and her progeny of any other breed.

February 17, M. Bassett, Hanford.

One of the most important transactions ever made in California Holstein circles was consummated last week when W. J. Higdon of Tulare sold the great yearling heifer, Miss Aralia De Kol Aaggie, to Fred Hartsook of Lankershim for a price more than double ever paid for a Holstein female in this state. Miss Aralia De Kol Aaggie was sired by Sir Aaggie De Kol Mead and is out of the great cow Aralia De Kol Pontiac Mead. She is one of the two heifers in the world whose seven nearest dams average above 1,100 pounds of butter in a year.

W. M. Bergstrom of Pleasanton, who made his initial purchases of Herefords at the fall sales held at Sacramento, has secured two carloads of very high class herd material from a number of the leading eastern herds. Bergstrom was one of the heaviest buyers at the Mousel Bros. sale in Nebraska, where he selected the young bull, The Anxiety 3d, a son of Young Anxiety, for $5,000. In the same sale four females were purchased for an average of $880. In the Rodwell sale 21 of the better sort of females fell to Bergstrom's bid. The addition of such cattle to the Hereford industry of this state will mean much in our future development and is evidence of the marked growth of our beef cattle industry.

The annual meeting and sale of the Western Berkshire Congress will be held at the university farm, Davis, during the annual Stockmen's Week. Details of the meeting will appear in a later issue.

W. M. Carruthers of Live Oak writes that he has selected seven females and one bull for the annual spring sale of the California Shorthorn Breeders Association and that he has gone pretty deep into his herd for his entries. Among the entries are: Opal Violet 2d, a daughter of Hallwood Villager and out of a Marsh Violet dam that sells with a calf at foot by Royal Knight, a son of Count Avon; Live Oak Secret, a red November two year old daughter of the former champion Count Glory and out of a Secret dam; Crimson Flower 2d, a beautiful white junior yearling daughter of Count Glory, and a full sister to the heifer for which William Bond paid $1,800; Riverside Grace and her full sister that are sired by Hallwood Villager and out of a Generosity dam; a December 1919 roan daughter of Count Glory and out of a Ringmaster cow and a roan daughter of the Villager bull and from a Ringmaster dam. The bull to sell is roan Count Glory Jr. that was shown at the last state fair as a senior calf.

Will Johnson, a member of the staff of the Shorthorn World, is visiting the Shorthorn herds of this state. This is Johnson's first trip to California and he has been greatly impressed with the character of Shorthorns he has found. Johnson says that from now forward California Shorthorns are certain to attract attention in the East and he predicts that many of our top productions will be in demand.

Caledonia Farms, West Sacramento, will be represented at the annual Shorthorn Congress show and sale to be held at Chicago next month with six females all carrying the service of Imp. Caledonia. In addition to the above, two bulls will be consigned. This is the first instance of a California herd being represented in a large Eastern sale.

At a meeting held at Stockton, January 21, Holstein breeders of San Joaquin County met and organized the San Joaquin County Holstein Friesian Breeders Association. About 15 breeders became members and the following officers and directors were elected: A. R. Magruder, Ripon, president; R. Stevens, Stockton, vice-president; R. E. Kilgore, Ripon, secretary-treasurer; J. M. Campbell, Escalon, J. W. Scudder, Escalon, M. H. Newborn, Manteca, and M. H. Cusick, Lodi, directors. The meeting was addressed by C. L. Hughes, secretary of the state association. It was decided that the new organization would work in close harmony with the state association in all matters affecting the welfare of the breed.

Harvey M. Berglund and Boyd Harold of Dixon have planned to hold their second annual sale of Duroc sows and gilts at 10 a. m. February 5. This is the day of the consignment sale at Davis. Anyone from a distance will be met at the depot in Dixon, taken to the morning sale and then in the afternoon taken by auto to the breeders' sale at Davis.

While many hog breeders are still feeling that it is hard to sell breeding stock, D. G. Cummins & Son, Visalia, have been enjoying a brisk trade. They report recent sales of 18 head at satisfactory prices, and have disposed of all the bred sows and gilts they can spare. Cummins & Son feel very optimistic over the future of the swine industry.

M. Bassett & Sons, Hanford, recently sold their fourth carload of fat hogs since September 1 and have another carload to be ready for market and more to take their place when they are gone. With the present prices of feed and fat hogs, Mr. Bassett reports the best profit in feeding the last carload he has made for several years. Few men in the state have had any more experience in feeding operations than Mr. Bassett. He also reports that more sows are being kept to farrow this spring than for many years.

Ratto Stock Farm, Napa, has just sold a carload of brood sows to the Brentwood Farms. This was a selected lot, some of them being registered Poland China and Berkshire sows, the balance all sired by top notch boars. A car of yearling and two year old Durham heifers were sold to B. F. Russi of Halfmoon Bay. This was a splendid lot of heifers from grade Shorthorn cows and all sired by Fanny's Sultan, a son of Sultan Maybower, the university bull. Two registered Berkshires and one Poland China boar were also sold to the California Livestock Company of Colma.

LOS ANGELES MILK RATINGS FOR A PERIOD OF EIGHT MONTHS

By J. C. Marquardt

Milk ratings of Los Angeles dairies based on the results of a milk scoring which started April 1, and which the health department has just finished, are as follows (three highest in each class):

Certified Milk

This is raw milk produced under the supervision of the medical milk commission of Los Angeles County Medical Society. Bacteria limit not to exceed 10,000 per cubic centimeter: Adohr Stock Farms, 99.0; Arden Dairy, 93.8; Cold Springs Dairy, 91.3.

40 Bred Sows and Gilts and the Grand Champion Boar, Great Orion Sensation

One of the Finest Show Boars and Best Junior Breeding Boars on the Coast

A son of the world's grand champion boar, Great Orion Sensation, he is also a brother to the world's junior champion boar.

He is the sire of many prize winning pigs in the 1920 shows including Miss Defender Sensation, first at Sacramento in class of 72 and junior champion at Riverside. Never before has such a boar entered the sale ring in the West.

ORION PATHFINDER

By the Ace of Pathfinders, he is out of the $1,500 sow in the A-1 Duroc herd at Visalia owned by J. P. Walker. He is a real boar farrowed March 2, 1920.

The List of Sows Includes

A Daughter of Pathfinder

Daughters of Winsor's Giant Orion, Grand Model 8th, Orion King Gano, Pathfinder's Likeness and Great Orion Sensation.

A Fine Lot of Spring Gilts by Great Orion Sensation Jr.

Guaranteed Milk

This is raw milk guaranteed by the producer with the written permission of the city of Los Angeles. Bacteria limit not to exceed 25,000 per cubic centimeter: Burr Creamery Company, 98.4; Elliott-Brant Rancho, 97.5; Los Angeles Creamery, 90.0.

Grade A—Raw Milk

This is the raw natural product from tuberculin tested cows. Bacteria limit not to exceed 100,000 per cubic centimeter: Walter Williams, 97.7; Jersey Dairy-Dolan, 96.6; A. Kravchyk, 95.9.

Grade A—Pasteurized Milk

This is milk that has been heated to a temperature of about 142 degrees Fahrenheit and held for about 25 minutes and then rapidly cooled to below 50 degrees Fahrenheit. Bacteria limit not to exceed 15,000 per cubic centimeter after pasteurization and 200,000 per cubic centimeter before: Sanitary Gold Seal Dairy, 95.5; Crescent Creamery, 95.2; Hansen Dairy, 93.3.

Goat Milk

Requirements as to bacteria same as grade A milk-raw: Beverly Hills Dairy, 94.4; Goat Dairy, 91.8; La Corona Dairy, 87.9.

Grade B Milk

This is milk put out in cans to restaurants and wholesale trade and contains less than 1,000,000 per cubic centimeters before pasteurization and less than 50,000 per cubic centimeters after pasteurization: Hansen Dairy, 85.0; Mutual Dairy Association, 83.5; Crescent Creamery, 80.3.

The score card used allowed 35 points for bacterial count, 15 for flavor and odor, 16 for absence of sediment, 15 for butterfat, 15 for solids not fat, 5 for acidity, and 5 for appearance of package. The final scoring for the period was under the supervision of R. J. Posson of the United States department of agriculture, Dr. A. S. O'Banion, head of the Santa Barbara health department, and J. C. Marquardt of the dairy division of the University of California. All classes of milk were scored on the same basis in regard to bacterial content. However, in an effort to further increase milk quality, the health department will modify this system in the future. That is, no points for bacterial content will be allowed to dairies having a higher bacterial content than is allowed for the grade of milk which they are producing. The revised score card of the United States dairy division is used in the work of the Los Angeles health department.

CAUSES FOR BITTER FLAVOR IN MILK

Milk sometimes contains a distinct bitter flavor which may be caused by the action of bacteria, feed which the cow has eaten, an abnormal condition of the cow's udder, or an advanced stage of the lactation period.

All milk is affected to a greater or lesser extent by the action of bacteria. The normal souring of milk is caused by a bacteria which is nearly universally found in milk. Besides the souring type of bacteria there are types which produce very disagreeable flavors and odors and among these are the bacteria which give milk a bitter flavor when they are allowed to grow and develop in sufficient number. They usually gain entrance to the milk with the dirt which drops into the bucket while milking or from dust in the air. Once they are in, they will multiply very fast and as their number increases the bitter flavor becomes more pronounced.

When buckets, pans and other utensils used in handling milk are washed in hot water, most of the bacteria are killed. There are a few, however, which may survive this treatment. If the utensil remains wet after washing, these bacteria which are left will immediately begin to grow and multiply, so that when the utensil is again used it will contain large numbers of them. These then go directly into the milk. If they are present in sufficiently large numbers the bitter flavor may be developed in a few hours, especially if the milk is not properly cooled. After the utensils are once infected the bacteria may be passed on in the milk from day to day providing the utensils are not sterilized. Utensils should be thoroughly washed and sterilized after each using. The milk may first be rinsed out with a small amount of warm water and then thoroughly washed with hot water and soap or washing powder. After they have been scalded with boiling water, or sterilized in live steam, they should be completely dried by then placing on the stove or in the hot sun. If placed in the sun, care should be taken to see that they are not contaminated with dust. If thoroughly cleansed after each milking, utensils will not carry the bacteria from one day to another.

Milk absorbs readily flavors and odors from such feeds as ragweed, onion, cabbage, kale or the highly flavored weeds. These should be eliminated from the cow's ration or at least not fed until just after milking. During the later summer and fall the pastures contain a number of strong flavored weeds which will produce a bitter flavor in the milk. An abnormal condition of the cow's udder is not an uncommon cause for bitter milk. If any irregularity is noticed either in the milk when first drawn or in the udder, the milk should not be used. The advice of a competent veterinarian is always advisable in these cases.

As a cow nears the end of the lactation period the milk becomes more or less abnormal. When within six to eight weeks of the close of the period the fat content begins to rise materially, the fat globules get small and hard and the milk sometimes takes on a pungent, bitter flavor. If the bitter flavor becomes prominent, the cow should be dried up. The cream during the latter part of the lactation period requires considerable churning to make it into butter, as the fat globules are too hard and small to adhere readily.

Cream which is held from three to five days before churning will usually make a bitter, off-flavored butter. Good butter cannot be made from poor cream. If the utensils are well washed and sterilized after each milking and strong feeds are not fed and the cow's udder is normal, bitter flavors will usually not be noticed. Milk from cows in the latter stages of lactation may, however, be bitter even if the other sources of trouble are removed.

THE FIFTH SHORTHORN SALE

A splendid lot of Shorthorn cattle will be offered at the fifth public sale of Shorthorns, to be held at the university farm, Davis, on Tuesday, February 22, 1921. The uncertain condition prevailing last fall prompted a postponement of the fall sale and the breeders have been saving up their best entries for the spring event. So many entries have been received that it is questionable whether they can all be disposed of in the one sale. In any case, the best will be selected for the sale on February 22. Clyde N. Moore of Montana will conduct the sale, which promises to be one of the most eventful yet held under the auspices of the California Shorthorn Breeders Association. The great bull, Maxwalton Lavender, is being entered and it is expected that buyers will come from afar to put in a bid on this magnificent breeding animal.

ACE OF PATHFINDERS

Plan Your DUROC FUTURE NOW!

SATISFACTION GUARANTEED

Every sow in this sale must be safe with pig or your money will be cheerfully refunded. See the generous guarantee in our sale catalog. Most of them are bred for March litters.

Good Sows Bought at the Present Low Prices Will Make More Money Than Hogs Have Made in 10 Years

The best efforts of the greatest Duroc breeders of the entire county have been concentrated to produce the extreme modern type and conformation of the sows and gilts that go into our February 16th sale. A purchase at that time will eliminate years of experiment and uncertainty on your part.

Bred Sow Sale

The Profitable Hog

OUR BEET CROP

A "Commerce Report" states, date of November 15: "Regarding conditions in the United States, the output of the beet crop in Ohio is estimated at 45,000 tons, Michigan at 145,000, Colorado 250,000, Nebraska 75,000, Utah 140,000, Idaho 50,000 and California 151,000. In this last state the campaign is so nearly over that the figure given will be very close to the actual outturn. The production of the various other states going to make up the estimate totals 94,000 tons.

"The above estimate is freely confirmed by the United States government, which estimates the crop of beet roots as of November 1 as 8,812,000 tons. Using an average yield of the past three years (including last year's poor outturn, gives a crop indication of 900,000 tons. This year's yield will exceed the three years' average materially, according to present prospects."

Dr. LeGear says

"To get more winter eggs hens must have help.

You must counteract conditions that hens live under in winter by stimulating their egg producing organs and fortifying their systems against disease. Thus you will increase your profits. Dr. LeGear's Poultry Prescription will do these very things. Used successfully by thousands of poultry raisers." For example:

"From my small flock I now get 20 to 25 eggs a day. Before giving them Dr. LeGear's Poultry Prescription I got only 4 or 5. Its cost has been repaid to me over and over." Mrs. J. W. Montgomery, Tunnel Hill, Ga.

Get it from your dealer to-day.

Harvest 20 to 45 Bushel to Acre Wheat in WESTERN CANADA

Think what that means to you in good hard dollars with the great demand for wheat at high prices. Many farmers in Western Canada have paid for their land from a single crop. The same success may still be yours, for you can buy on easy terms.

Farm Land at $15 to $30 an Acre

located near thriving towns, good markets, railways—land of a kind which grows **20 to 45 bushels of wheat to the acre.** Good grazing lands at low prices convenient to your grain farm enable you to reap the **profits from stock raising and dairying.**

Learn the Facts About Western Canada

—low taxation (none on improvements), healthful climate, good schools, churches, pleasant social relationships, a prosperous and industrious people.

Poultry Queries

Conducted by J. A. Koethen

Triple Yolked Eggs

About May 1 of last year my wife bought five little ducks, a cross between Pekin and Indian Runner. One died, and of the remaining four, two were drakes. When they were five months old the two ducks began to lay. One of them laid an unusually large egg, which when it was broken proved to contain three yolks. A few days later the same duck laid another three yolked egg. We have had two eggs a day from the two ducks with almost unfailing regularity since the first of October. Did you ever hear of an egg with three yolks before?—C. S. P., Santa Ana.

I never did, outside of a book. In "Poultry Diseases and Their Treatment," published by the Maine station, we are told: "Eggs with three yolks are very rare. An egg of this kind laid by a pullet at this station is shown in Fig 42." That, you notice, was a pullet egg. Possibly duck eggs, which are larger, are more frequently triple yolked.

Ration for Layers

Will you please tell me the amount of feed I should give two dozen R. I. Red hens, and how often and what kind? They have free range and I am feeding wheat and barley. I am getting but six and seven eggs a day and it seems to me they should lay more.—Mrs. F., Pond.

Whether six or seven eggs is as many as you should have from 24 hens at New Years depends largely on their age and condition. If they are yearling hens and not quite through the molt, 25 per cent is not bad. If they are old hens it is all you can expect. If they are pullets they ought to do better. Your ration, however, is not balanced, and a more complete ration will probably result in better production. They should have a laying mash where they can reach it at any time. One of the commercial mashes kept by all feed stores will be all right. Then give them morning and night their scratch grain, a little in the morning and the rest at night, feeding about two quarts a day for the 24 hens. No one can lay down an exact rule for the amount of grain to feed a hen each day, but they should always have all they want. See that they go to roost with full crops.

Weak Legs in Poults

I have eight young turkeys five weeks old. When they were a week old I took them from the mother turkey and gave them to a chicken hen. After a few days she began to shake her head as if she had something in her nostril, and I took them from her and am raising them by hand. They are quite large for their age, but they shake their heads as the hen did, and seem to have little use of their legs. I have kept them warm and dry; they eat well, but their legs are very weak. —Subscriber, Fields Landing.

Your little turkeys are getting more food than exercise, that is to say, the muscles of their legs are not strong enough to hold up their bodies. Better cut down their ration and make them forage for a good deal of their living. Now that there is so much green everywhere, they ought to be able to pick up half, anyway, of their food. You do not say what you are feeding them, so I cannot advise as to that except to say in a general way that rolled breakfast oats are excellent for muscle building, and you might once a week give them a pan of bran containing about five per cent bone meal. The right food is important in developing muscle, but exercise is vital. That shaking of the head I should sooner lay to head lice than to anything in the nasal passage. If they have not been well dusted they should be.

Rice Meal for Layers

I want to thank you for the information given in your issue of December 4 in regard to dry mash. I am now feeding 8 parts mill run, 1 part alfalfa meal, 1 part coconut oil cake meal, 2 parts barley meal, 1 part corn meal, 1½ parts meat scrap. Would it be all right to add rice meal, which is a cheap feed in this section?—E. P. L., Oakdale.

A recent feed letter from the poultry division at Davis says: "Rice bran containing no hulls and not less than ten per cent crude protein, five per cent fat and not more than 15 per cent fiber (guaranteed analysis) as well as rice polish and ground rough rice may be added to the mash mixture, if it can be purchased at less cost than similar and more common feeds during periods of high feed prices. Such rice feeds should not be used to a greater amount than 20 per cent (25 per cent maximum) of the total grain and mash ration, or 20 per cent of the mash alone. Rice feeds are very starchy and quite fattening in character. They have a high oil content and ground rice feeds are apt to turn rancid in a short time. They must therefore be handled and fed with care." As the mash you are now feeding is quite rich in protein you could add 1 part rice, I think, to the mixture as it stands. If you wish to use the maximum 20 per cent, you might omit the corn meal or the barley meal, whichever is more expensive in your section.

Why Grain at Night?

I notice in a poultry book the following: "Mash feed should never be fed in the morning and coarse grain should never be fed in the afternoon." This seems just opposite to the feeding of most people. Please tell me which way is right and why. — Subscriber, Fallbrook.

Either that quotation is a typographical error or the person who wrote it knew nothing about chickens. The fact that all experiment stations advise and all poultrymen practice the feeding of dry mash all day and of scratch grain in the afternoon or evening should of itself be pretty strong proof of the rightness of the method, but the reason is not far to seek. If hens are given all the hard grain they want in the morning they will fill their crops and loaf all the rest of the day. If they do not get a good feed of hard grain at night they will go to roost with empty crops. In either case a diminution in production will result. Most feeders give a little grain in the morning (one-third or thereabouts), but they feed it in litter, preferably the night before, so that the hen, as soon as she is off the roost, will go to scratching and will find something to reward her for her efforts. Her crop is not filled, however, and so she consumes a good deal of mash, which she does not find as palatable as the grain, but which is the real egg food, during the day. Late in the afternoon, when her crop is partly filled with mash and greens, she gets her fill-up of grain and should go to roost with her crop stuffed full so that her digestive organs may be kept busy grinding egg material all night. The New Jersey station is now advocating an 8 o'clock supper of grain in winter in addition to the one given at 4:30 or 5, on the ground that hens will lay more and keep in better health without the 12 hour fast from sunset till the lights are turned on at 4 a. m.

DECEMBER REPORT NATIONAL EGG LAYING CONTEST

The 300 hens in the Tenth National Egg Laying Contest laid 4,107 eggs during the month of December, or an average of 13.69 eggs per hen. Pen 12, S. C. White Leghorns, owned by F. M. Emhoff, Springfield, Missouri. won the cup for December by laying 124 eggs during the month.

The number of eggs laid by the different breeds for the month and to date, are: Wyandottes, December, 820 eggs; 10 months, 1,399. Leghorns, December, 753; 10 months, 1,356. Adconas, December, 731; 10 months, 1,329. miscellaneous breeds, December, 651; 10 months, 1,098. Rhode Island Reds, December, 611; 10 months, 1,019. Plymouth Rocks, December, 541; 10 months, 897.

The ten leading pens for December are: S. C. White Leghorns, Missouri, 124 eggs; S. C. White Leghorns, Washington, 119; White Wyandottes, Missouri, 111; White Wyandottes, Illinois, 110; Buff Orpingtons, Missouri, 103; Barred Rocks, Missouri, 102; White Wyandottes, Missouri, 100; Columbian Rocks, Missouri, 99; White Wyandottes, Illinois, 98; Black Langshans, Missouri, 97.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

During the past ten days many of the pullets that have gone through a molt since the contest started have come back into laying again. The long continued spell of wet and unusually cold weather has been quite severe on the molting birds, retarding the necessary quick growth of the new plumage. Following are the high pens for the past ten days:

Hanson's Poultry Farm, Corvallis, Oregon, 75; La Rita Poultry Farm, Santa Cruz, 70; W. H. Marshall, Santa Cruz, 70; S. L. Gibson, Santa Cruz, 69; Hollywood Farm, Hollywood, Washington, 66; W. A. Ford, Umatilla, Oregon, 64; Geo. Gray, Santa Cruz, 62; S. L. Gibson, Santa Cruz, 55; Oregon Agricultural College, Corvallis, 53; S. L. Gibson (Brown Leghorns), 53; Oregon Agricultural College (Barred Rocks), 53. All the above entries are White Leghorns except the last two.

THOUSANDS of young chicks die every year because folks seem to forget that they are just babies requiring food suitable to their baby bodies.

Give your chicks a fair chance. Start them on Globe "A-1" Baby Chick Mash *(containing Dry Buttermilk)* and watch the little fellows thrive.

FOR GROWING CHICKS

After your chicks are about six weeks old change the ration to Globe "A-1" Growing Chick Mash (containing dry buttermilk) and when the pullets are five months old begin to feed Globe "A-1" Laying Mash (containing dry buttermilk) and get ready for the full egg basket.

There is practical and scientific knowledge put into Globe "A-1" Baby Chick Mash. It isn't just feed. **It's that and more—a health protector.** The generous quantity of pure dry buttermilk which it contains gives it this invaluable property. The lactic acid content cleanses the baby chick's system, and protects it from the ravages of disease. **(It has proved a preventative of white diarrhoea and coccidiosis.)**

Nutritious hearts of grains, meatine, selected whole ground grains, and plenty of pure dry buttermilk,—that's Globe "A-1" Baby Chick Mash.

GLOBE A-1 GUARANTY

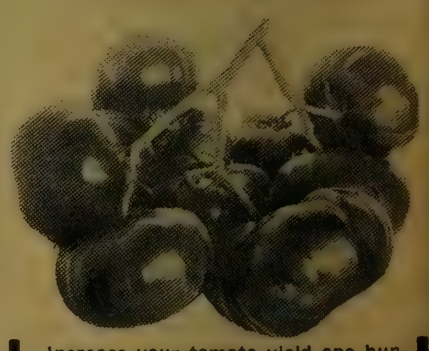
The Diener Tomato



Increase your tomato yield one hundred per cent by raising the new DIENER TOMATO. 30-40 tons of ripe fruit to the acre.

This tomato was raised last year all over the United States and Canada with the greatest satisfaction.

As smooth as an apple and of a magnificent dark red color. Single tomatoes weigh up to 3 lbs. each. The flesh is more solid than that of any other tomato. The fruit contains very little seed and is solidly filled out. This tomato is free of the acid taste, and for dehydrating, catsup, and canning it is the best tomato in existence today.

The DIENER TOMATO is blight-resisting as well as drought-resisting. It will not crack from the rain and will not rot while lying on the ground in wet weather. This tomato will grow in almost any kind of soil and it commences to ripen the first part of August.

It is the greatest novelty in the tomato line, and it will soon crowd out the present varieties from the market by its far superior qualities.

Price of the DIENER TOMATO SEED: Sample pkg., 25c; one-quarter of an acre pkg., 50c; one acre pkg., $1.50.

OUR 1921 CATALOGUE, describing our many other novelties in flowers and grains, is free on request.

HAY

Alfalfa Growers of California under date of January 26:
There were 967 tons received in San Francisco the week ending January 22.
No. 1 Dairy Alfalfa.....21.00
Standard 19.00
Under date of January 22, A. W. Scott Co. says:
Receipts of hay for the past week 967 tons. Weather conditions have kept consumption in the country reduced and offerings have been heavier in every direction than the general demand. There is, however, a more healthy tone and feeling to the hay business which seems to be reflected from the same sentiment in all lines. Alfalfa has been extremely dull for the last two or three days with heavier offerings from Nevada interfering with the movement of our California stocks. A little inquiry from some of the larger dairies has stimulated trading somewhat but at a lower range of prices than have been ruling up-to-date.
We quote today wholesale prices in carload lots as appear from dealers' transactions upon the hay market in San Francisco (for prices to consumers charge of cartage, commission and handling expenses must be added, according to conditions).
Wheat Hay, Fancy.....20.00@21.00
Wheat Hay, light 5 wire bales.17.00@20.00
Tame Oat Hay, fair to choice..17.00@19.00

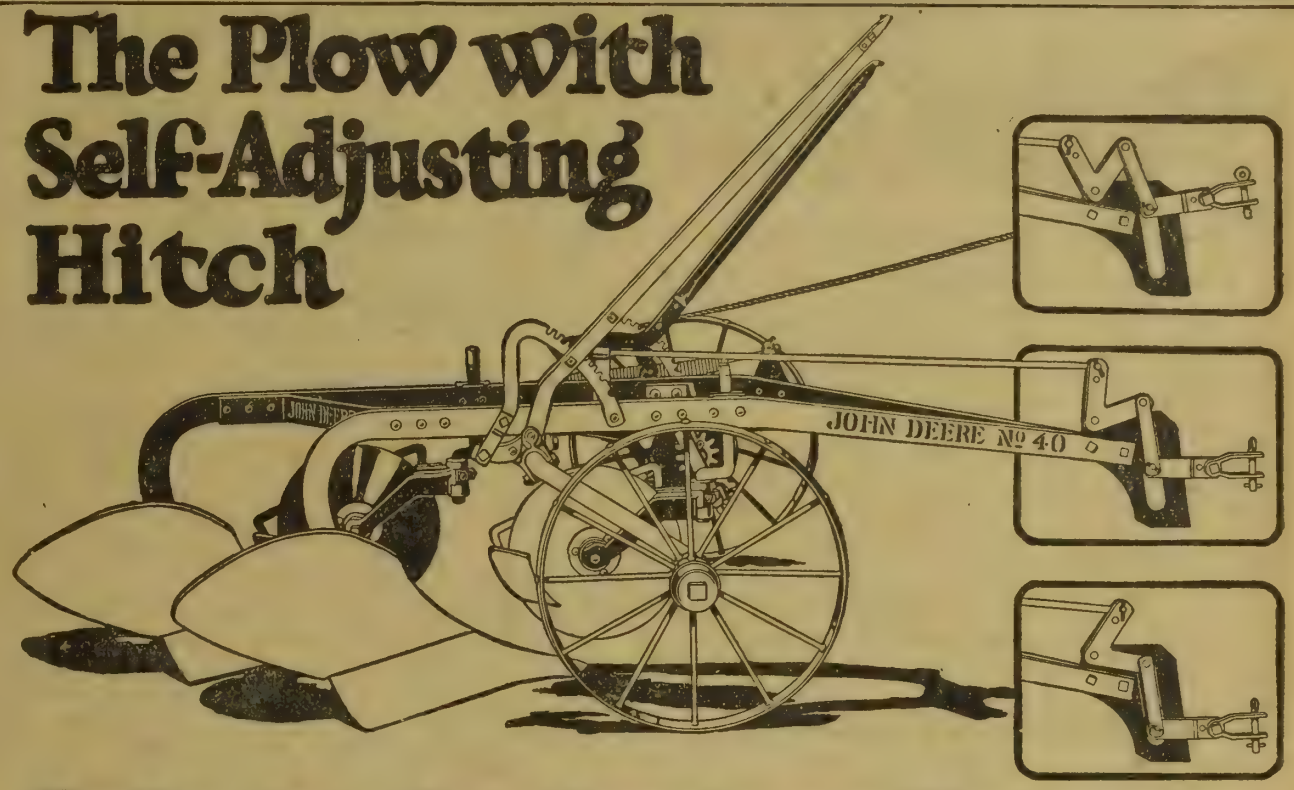
The Plow with Self-Adjusting Hitch



Built for the Fordson Tractor

YOUR Fordson needs a plow with self-adjusting hitch. That's one of the original and important features of the No. 40—the plow that John Deere built for the Fordson. Because of this hitch, the No. 40 automatically maintains proper line of draft as depth is varied with the depth lever. Bottoms always have the proper suction—"no nosing in", no "hopping out", no "bumpy" furrows.

JOHN DEERE No 40
The PLOW with the SELF-ADJUSTING HITCH

The self-adjusting hitch goes with unusual light weight and light draft plus great strength in making the John Deere No. 40, "the plow that fits the Fordson".

Built of John Deere New-Process Steel, the No. 40 is lighter than the average horse-drawn sulky; and it has tremendous strength to withstand severe plowing strains.

Beams are guaranteed not to bend or break.

Pulls extremely light—Because of proper line of draft at all times, the scouring qualities and general high grade construction of its genuine John Deere bottoms, light weight and the rigidity of its frame, the No. 40 is exceptionally light draft. It's a real fuel saver.

Simple, Positive, Power Lift—lifting parts move only when plow is being raised or lowered—practically no wear.

Does High Grade Work. The genuine John Deere bottoms insure good turning, scouring and pulverizing. They do the work the way you want it done. You can get your No. 40 equipped with John Deere bottoms of the shape and type to suit your soil.

Get Acquainted with the No. 40. You will find it is the plow your Fordson needs. Remember, the plow is the "business end" of the tractor plowing outfit. The tractor furnishes power; the plow applies that power in making the seed bed. Be sure to get a good plow for your Fordson. Write today for a folder describing the John Deere No. 40.

Any plow for use with the Fordson needs a self-adjusting hitch. Only the John Deere No. 40 has this hitch. Note the illustration above showing how the hitch of the No. 40 automatically adjusts itself to the proper line of draft as depth is varied with the depth lever.

JOHN DEERE

JOHN DEERE MOLINE, ILL

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

what do you buy—"feed or feel"?

Even the most expert poultryman can't tell the quality of a feed simply by looking at it or feeling it. Because a feed can be light or dark, fine or coarse, and yet not vary one-tenth of one per cent in net feeding value.

That's about the least important feed test in the world—texture! For example: Some wheats grind up rather coarse—others rather fine. That makes a big difference in "feel." But does it make a difference in feed value? No!

YOU can set it down as a pretty pat rule that the "feel" of a feed means *nothing*. Texture is about the least important thing in the world when you buy feed. Color is about the least important thing, too. Feed value is the *most* important thing. For *feed value* is the thing you're buying—nothing else and nothing less.

Experience has taught us that proprietary feeds cannot be manufactured in an economical way if color and texture are strictly adhered to. A change in the manufacture of different colored corns, different colored wheats, different colored sorghums or different colored meals immediately shows a change in the color of the by-products. But here's the essential point: *there's no change in feeding value.*

So, why fuss over the "feel" of a feed when the thing you're paying for—the thing your hens are praying for—is feed value? Seasoned poultrymen who use SURELAY year in and year out know this. They know that, regardless of "looks" or "feel," SURELAY is a uniform quality-feed that makes hens pay by making them lay. And that's the only test that interests them—or you!

You can't "go wrong" on SURELAY because our daily laboratory tests make sure that every batch of the feed "goes right" in the blending. That cuts out guess-work in the making and guess-work in the feeding.

Thousands of successful poultrymen have witnessed the profit-performance of SURELAY season after season. They have quit worrying over color or texture. As a matter of fact, they have quit worrying over the feed question altogether—thanks to the uniformly high standard of Sperry Feeds.

That's why we're anxious to bring *you* into the fold. If you haven't seen our booklet, "Make Hens Happy," mail the coupon for a copy of our new edition. You needn't bother to write a letter—although we're ever ready to discuss your feed-problems with you.

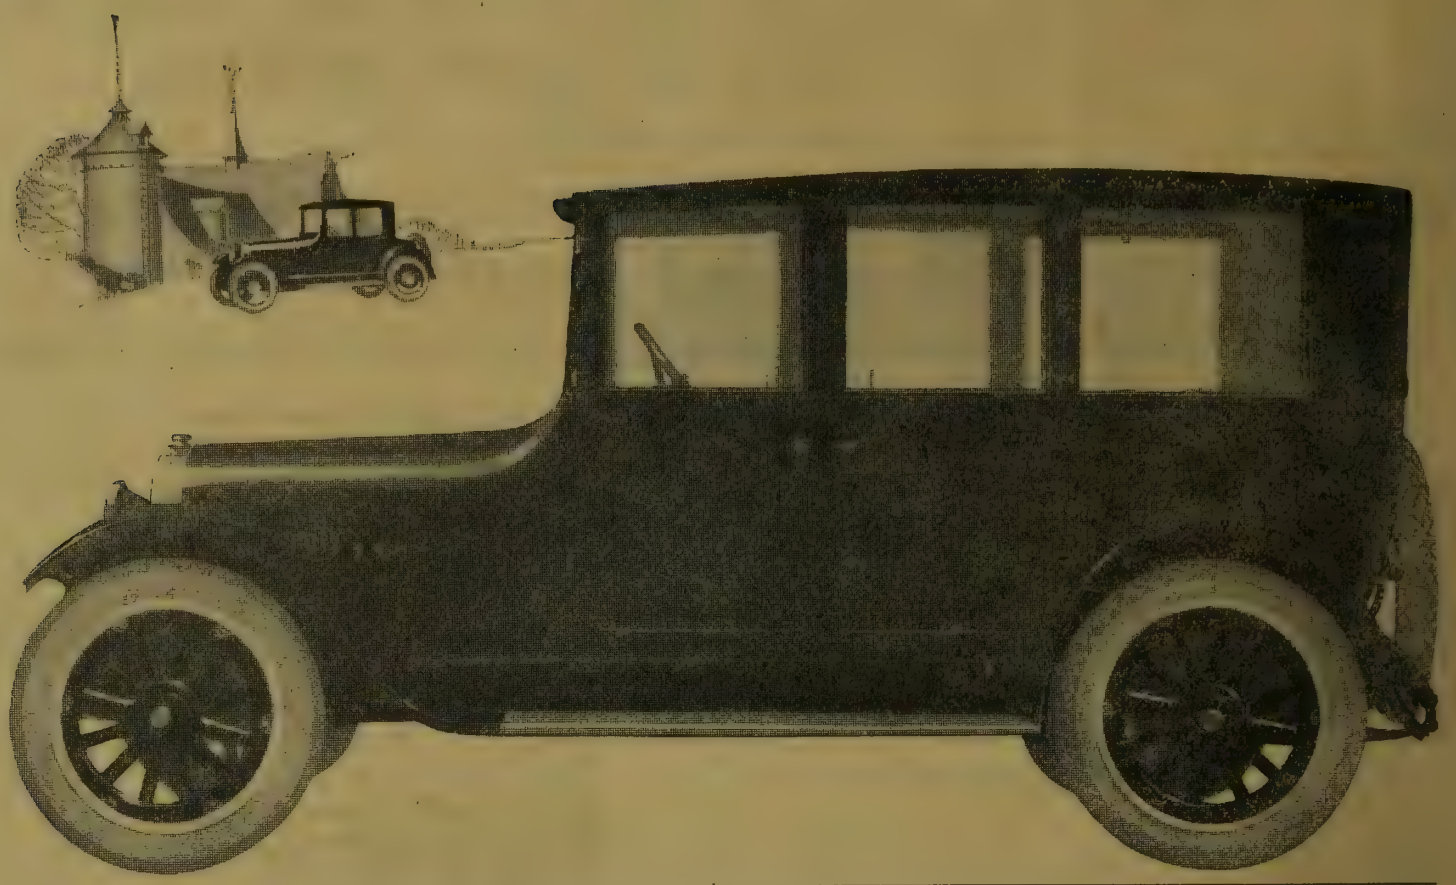
OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES



THIS OAKLAND SENSIBLE SIX SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

Summer or winter, over country or city roads, every mile in an Oakland Sensible Six Sedan is a comfortable mile. And an economical mile, also. For this efficient car delivers its reliable service at the very minimum of cost. Consider carefully these things about the Oakland, then contrast against them the very moderate price at which this Oakland is sold. Certainly no earlier type of motor car offers equal value, whether as an investment or as a means of satisfactory personal transportation.

OPEN CAR, $1395; ROADSTER, $1395; FOUR DOOR SEDAN, $2065; COUPE, $2065

Planning and Planting a Vineyard: Phylloxera

By Fred K. Howard

PHYLLOXERA is perhaps the most serious pest of the cultivated vine in the world. California has her share of this insect and it is impossible to even estimate the annual loss caused by its insidious attacks. It is an established fact that the insect may be present for years in a vineyard and the grower not realize the cause of his failing vines. Even though the insect works slowly as a rule, nevertheless it works surely, and sooner or later the vineyard will be a memory instead of a source of revenue to the grower. Nor is this pest confined to a few small areas in the state. No one who has given this matter any

As Phylloxera Appears

Upper photo: Vine roots showing the swellings caused by phylloxera. The degree of damage is usually determined by the character of these swellings, as they usually rot very quickly. Lower: An Emperor vine in midsummer. The short stubby growth on this vine is typical of phylloxera injury.

study will say at this time that any district where vines are grown is free, except perhaps the district south of the Tehachapi.

For this reason the prospective grower should use every precaution to prevent the vines he is planting from being infested with this insect. The presence of even one insect on a vine would undoubtedly mean the destruction of the entire vineyard in due time.

What Is Phylloxera?

First of all let's get acquainted with this little fellow and then we will consider how he works. Almost everyone is familiar with the soft bodied, comparatively long legged plant lice which pester the life out of milady's roses every spring, and for that matter appear on most of the garden truck in the back yard. Some of these clumsy looking fellows are green, while another kind may be black, or possibly lavender, or even white. Well, phylloxera really belong to the same family of insects as do these common every day plant lice or aphids. Like the rest of the family they are sucking insects, that is, they feed by puncturing the tender tissues of the plant with a sharp beak or probosis and suck out the juices. But they are much smaller than most of the family and are in fact only about one-twenty-fifth of an inch in length. All of which means that they are so small that they can just be seen with the naked eye. They are greenish yellow in color, getting a little darker in the winter than in summer. They will feed on the roots of practically all the varieties of grapes. In a nutshell then phylloxera, or phylloxera vastatrix, if you please, is a very small plant louse, greenish yellow in color, which feeds on the roots of grape vines. Now we are acquainted, but we are not pleased to meet you, Mr. and Mrs. Phylloxera.

How Did It Get Here?

According to Prof. G. C. Husmann of the United States department of agriculture, the phylloxera is not a native of California but probably is a native of the states east of the Rocky Mountains. He gives an interesting account of it in Bureau of Plant Industry Bulletin No. 172 as follows: "The phylloxera, which is not a native of California, was introduced into that state either from east of the Rocky Mountains, where it is indigenous on wild vines, or from Europe, or possibly from both sources. In 1880 it was found to exist in Sonoma, Napa, Solano, Yolo, Placer and Eldorado Counties. No careful investigation had been made at that time of the region much farther south in the state. It probably existed in Sonoma County as early as 1873, and it is possible that it occurred in the Sonoma Valley and on the Orleans Hills at least 20 years before that time.

The insect was probably introduced into Europe on American vines and taken there about 1858 to 1862, when the destruction of the French vines from oidium was feared. From that period until 1885 it became widely scattered throughout Germany, Switzerland, Austria Hungary, Italy, Russia, Turke and Australia."

From this small beginning in California, after having been spread slowly but surely almost around the world, we now have in this great state a very serious pest which is known to exist in this line-up of counties: Glenn, Butte, Sutter, Eldorado, Sacramento, Yolo, Napa, Sonoma, Marin, Solano, Contra Costa, San Joaquin, Calaveras, Tuolumne, Alameda, San Mateo, Santa Clara, Santa Cruz, Fresno, Tulare, Monterey, Kings and Santa Barbara. It has been aptly said that simply because the rest of the counties of the state are not listed with these is because either grapes are not grown there or that no one who was interested and knew what to look for has spent any time in these counties investigating the conditions. At least those districts which claim to be free of the pest need to look out for their laurels.

No Control Methods Known

In spite of the fact that the pest has caused the destruction of vines for all these years and almost everything has been tried to control its ravages when they are once established, nothing so far has proven successful. It is indeed a problem that deserves the attention of every one in the state, it matters little whether we are vineyardists, dairymen, merchants or bankers. For the very fact that this insect is present in such numbers is a menace to one of the great industries of California. Since there is no method of control it is evident that every effort must be made to prevent its spread in the older vineyard districts, and it should if possible be prevented from entering into the great new districts which are being developed every year, especially in the San Joaquin and Sacramento Valleys. And by all means it should be kept out of the districts south of the Tehachapi Mountains.

Phylloxera Spot and Vacuum Treatment

Upper photo: A characteristic phylloxera spot in a Muscat vineyard. Lower: A portable vacuum fumigation outfit which is being used by the state department of agriculture to determine if vines may be disinfected in this manner without injury.

Resistant Roots Only Salvation

In those districts where the phylloxera is already established the use of resistant roots grafted to the desired commercial varieties is the only chance the grower has if he wishes to stay in the business of producing grapes. Unfortunately, by far the best work in the studies of resistant vines with reference to soil adaptability and the congeniality existing between them and the commercial varieties has been done on the wine grapes, and at the present time the greatest planting interest centers on the table and raisin varieties due to national prohibition. This situation, together with the fact that the establishing of a vineyard on resistant roots, even when the proper root is used, is both expensive and difficult, will probably result in a great financial loss to the grower and to the districts where such steps are necessary. If work could be started at once to determine the proper root stocks for the table and raisin varieties, and the soil requirements of these different roots, as well as the other problems which will naturally enter into any consideration of work of this sort, it would be years before anything definite in the way of recommendations could be given out that a grower might accept with any degree of certainty that he was doing the very best under his particular conditions. A bill has been introduced in the legislature this session by Senator Harris which makes provision for this work, and in addition to this the United States department of agriculture and the University of California will undoubtedly continue with the work they have been doing for some time.

Spread May Be Prevented

All of this discussion leads to one conclusion. The continued spread of the phylloxera must be prevented. By far the most frequent means of spread is on rooted vines, and it is obvious that if some method can be used to thoroughly disinfect all of the rooted vines grown, it matters little where, we can then hope to check, in a measure, at least, the spread of this pest.

It has been determined, both in

(Continued on Page 170.)

Agricultural News Notes of the Pacific Coast

Northern California

Sacramento County almonds are blooming.

There are 800 colonies of bees in Napa County.

Sacramento County is holding farm management schools.

Sonoma County poultrymen are appealing for tariff on eggs.

Nevada City, near Grass Valley, has just organized a farm center.

Bowman, Placer Conuty, farm bureau is studying poultry problems.

Sacramento County farm centers are discussing green manure crops.

The state convention of Beekeepers will be held at Oakland, March 2-5.

The weather bureau reports 114 inches of snow on the ground at Summit.

Trinity County proposes to hold a county fair at Weaverville some time this summer.

Orland, Glenn County, will add 2,500 acres to its vineyards by this season's planting.

Moisture test shows California rice to be well within department of agriculture requirements.

Applications for grazing permits in Tahoe national forest will be received up to March 1.

Yolo County will plant extensively to figs. Commissioner Gould reports acreage will be close to 500.

Fred A. Ellenwood was reelected president of the California Wool Growers Association at a meeting recently held in Davis.

Sonoma County farm bureau is insisting that American producers and consumers shall be protected against the cheap Chinese egg.

The Pacific Rice Growers Association at a recent meeting placed all its 1920 crop rice in the hands of executive committee with full power to act.

Placerville Fruit Growers Association recently held annual meeting attended by 125 members. A $25,000 rebate or return was made to members.

Manager Davidson of the state irrigation association recently made address before the chamber of commerce of Colusa, urging endorsement of the Marshall project.

Hop men of the Sacramento Valley are investigating as to costs of production and have declared that if the labor costs of 1920 are continued it will be impossible to grow hops.

Sacramento County Pomona Grange has investigated cost of almond production and finds it to be $86.50 per acre. The average production in the state from 1910 to 1919 was about 700 pounds per acre.

The proposal to move the agricultural college from Berkeley to Davis called forth little opposition from the first session of the state legislature, but we are promised "one pretty little fight" when the legislature reconvenes, February 24.

Petaluma shipped last year 22,223,923 dozen eggs; the preceding year, 1919, total shipments were 16,047,355 dozen, a net gain of over 6,000,000 dozen, the greatest of any year in Petaluma's egg producing history. She also shipped 240,041 dozen of poultry in 1920, or more than double shipments of 1919.

Central California

Modesto held a fat hog auction, February 1.

The value of California's annual prune crop is $5,000,000.

The San Joaquin Valley has been visited by drenching rains.

Lodi vineyardists staged an immense rabbit drive, January 23.

Stanislaus County's crops for 1920 are pronounced worth $43,417,000.

The water of La Grange dam is now the highest it has been since 1911.

Tulare County is after noisy motorcycle riders; closed mufflers is the rule.

Merced County boys and girls calf clubs are looking for pure bred Holsteins.

Fresno reports 30 fires during 1920, traceable directly to carelessness of smokers.

California's distribution of auto plates has already reached the 400,000 mark.

Tulare County's fair dates, September 12-17; Hanford fair dates, September 20-25.

California Bean Dealers Association recently met in annual banquet in San Francisco.

Stanislaus County's farm bureau membership drive has been held up by continued rains.

Tulare County's squirrel drive called forth the ever present movies to take pictures of the drive.

Farm bureaus of the San Joaquin Valley are making drive for greater number of grain elevators.

A bill has been introduced into the state legislature making appropriation for campaign against grape mealybug.

Tulare County is more or less concerned over the changing of the routing of the Naranjo-Lemon Cove highway.

The San Joaquin Light and Power Corporation proposes to increase its capitalization from $25,000,000 to $150,000,000.

Chester Rowell has resigned his position with the federal shipping board and accepted California railway commissionership.

Tulare's fat hog auction sales disposed of 182 cars, or 15,141 hogs, and total sales amounted to nearly half a million dollars.

Terra Bella irrigation district expenditures during 1920 were $202,000. The outstanding indebtedness is nearly a million dollars.

The water committee of the Bakersfield Civic Commercial Association is endeavoring to secure adequate water supply for that city.

Max Thelan is making addresses in the interests of the Fresno irrigation district. The campaign began January 31 and is still continuing.

Farmers Union, Stanislaus County division, annual meeting was held January 21. C. W. Johnson was elected president and Mrs. E. C. Whittemore, secretary-treasurer.

Orange growers of Tulare County are advised to meet at Lindsay, February 9 to discuss picking, packing, shipping and cultural methods. It is presumed tariff protection of olives and lemons will be urged at this meeting.

Southern California

Brawley has shipped out about 400 carloads of lettuce.

The Oxnard farm bureau is conducting a membership campaign.

A new drainage district is proposed for Oxnard, Ventura County.

Riverside County claims an output of 820 tons of honey in 1920.

Brawley, Imperial County, shipped 200 carloads of tomatoes last year.

Farm bureau of Orange County is planning to establish a labor bureau.

Many lemon growers are reported to be planning to bud over their lemons to oranges.

The California Walnut Growers Association is asking congress to put a duty of four cents a pound on imported walnuts.

Two hundred and fifty tons of Lima beans were shipped last week from Hueneme to San Pedro for reshipment to New York.

The Riverside Beekeepers Association is urging necessity of a uniform law throughout the state to control movement of bees.

Beekeepers of Riverside County are protesting against the leniency of the courts in dealing with people who set fire to bee ranges.

Most of the apricot acreage in Orange County is reported to have been signed up in the California Prune and Apricot Growers Association.

Demonstrations in pruning grapefruit were given at various points in the Imperial Valley last week. They were in charge of the farm bureau.

Almond growers of California are also urging a protective tariff. They want five cents a pound on almonds in the shell and 16 cents on the shelled nuts.

Directors of the dairy department of the Orange County farm bureau met February 1 to elect officers and discuss the county dairy cow competition.

At the annual meeting of the Garden Grove Walnut Growers Association last week W. E. Schnitzer was elected president; C. K. Lee, secretary and manager.

During December 88 cows in the Riverside County Cow Testing Association won place on the honor roll for production of 40 or more pounds of butterfat.

Horticultural Commissioner Waite of Imperial County reports a larger acreage planted to tomatoes this year than last; also that the crop will be earlier this year.

At the recent annual meeting of the Santa Paula chamber of commerce a committee was appointed to attend to making shipment of beans to the Near East Relief Association.

The Riverside Press estimates the citrus crop of the state at 53,000 cars. For Southern California, 39,500 cars of oranges and 8,700 cars lemons; Central California, 4,300 cars oranges, 200 lemons; Northern California, 300 cars oranges.

At the recent meeting of the Riverside County Beekeepers the frequency of thefts of bees in that section was discussed and it was decided necessary to form a Southern California counties beekeepers vigilance committee and to recommend that all beekeepers brand their hives.

The Coast and General

Arkansas is certifying sweet potato seed.

South Florida fair will be held at Tampa late in February.

Texas tomato growers are organizing a marketing exchange.

California yielded during December 10,000,000 barrels of crude oil.

Perris Valley farmers are meeting and discussing cotton production.

Chicago and other Eastern centers are showing declines in price of gasoline.

Truck farmers about Chicago have organized and are securing more just treatment in marketing.

An irrigation congress at Portland reported 60 irrigation districts in the state including 1,209,000 acres.

Hillsboro, Florida, is shipping quantities of berries and other small fruits through cooperative association.

Florida reports lettuce going to seed and being plowed under because prices do not pay for the cutting.

Utah state legislature urges the national congress to enact legislation that will restrict immigration of Asiatics.

One hen in the egg laying contest being conducted at Corvallis, Oregon, produced during December $1.55 worth of eggs.

Storm which visited all California also gave to Arizona heavy precipitation, and livestock ranges are now reported as promising good feed.

It is claimed that railways are becoming restive under domination of the express companies, and there are manifestations of a breaking away.

Wheat growers recently convened in Pullman, Washington, and devoted most of the time in various sessions to discussing marketing problems.

Oregon wool men are urging the organization of the Wool Growers Association of the Northwest, which shall include at least 60 per cent of the sheep.

An orange company of Tulare County recently sued a nursery agent for damages because of selling trees untrue to name and secured an award of $2,000.

The Southern Tariff Association held meeting at Atlanta, Georgia, last week, at which over 2,000 delegates from various Southern states were in attendance.

The Deglet Noor Association of Coachella Valley reports 65 cents per pound net for first quality Deglets, 40 cents for second, or a field run average of 54 cents.

The International Apple Shippers Association, meeting in Cincinnati, spent much of its time discussing legislation and transportation, especially present embarrassing freight rates.

California-Oregon Power Company has applied to the California railroad commission for permission to reorganize and to issue $10,000,000 in bonds to be used in paying debts and extending power plants in the two states.

Hood River orchardists have been stung by dealers disposing of large quantities of worthless spray material. Analysis showed it to contain only a small quantity of lye and sal soda and to have no beneficial qualities whatever.

The Motor Truck and Transportation

By Arthur L. Dahl

BACK of every advancement there is a fundamental reason. If we look to such fundamentals we find that the basis of all rural development is transportation. The slender rails of our steam roads open up the way for the social and economic expansion of farm life, for they bring to the producer of food ready markets for those products, and they likewise keep him in touch with the refinements of the city. With the development of our public highway systems, new transportation problems are being solved by the advent of the motor truck into the competitive field of the railroad.

With the coming of the automobile the farmer learned how to be independent of the train in the matter of going to and from the town or city. Now, with his motor truck he can be independent of the steam cars when it comes to selling his farm products, and if he has not a farm large enough to justify the keeping of a truck for his own exclusive use, he will find plenty of operators who will handle his produce on a commercial basis. The new mode of transportation of farm freight has many advantages over the old, including the saving of time, loading and often expense. In certain industries, such as dairying and poultry raising, the motor truck is revolutionizing things, by enabling the owner to conduct his business far beyond the city limits, where lands are cheap and operating conditions favorable, and yet get his fresh produce to market in less time than formerly.

Competitive motor transportation is only possible on good roads, where maximum loads may be carried with minimum operating and replacement expenses. The spending of vast sums of money by the federal and state governments in the building of good public highways is reflected in the increased number of cooperative and commercial projects for the establishment of motor transportation.

California ranks as one of the leaders in good roads construction and most of our rich producing districts are now honeycombed with well built roads, and when the $20,000,000 or more now available for new highways have been expended, there will be few farms that are not within striking distance of a permanent highway. Accordingly the California producer, whether he raises grain or fruit, hay or hogs, or produces milk or eggs, will find the motor truck an efficient servant in solving his transportation problems.

The office of public roads of the department of agriculture has conducted some interesting experiments to determine the cost of hauling in rural districts and the effect of improved roads in those districts. It was found that improvement of roads in eight selected counties in different sections of the United States resulted in the aggregate in a total gross annual saving in hauling costs of $627,409. The studies extended from 1909 to 1915 and the counties selected were chosen because they had just issued bonds for road improvements when it was decided to make the studies, and it would therefore be possible to cover the road improvements from commencement to completion. The average gross annual saving in hauling costs due to the road improvements in these eight counties was found to be 17.9 cents per ton-mile, while the net saving was found to be 11.6 cents. In Spotsylvania County, Virginia, one of the counties studied, 76 miles of road were improved at a cost of $173,000. The average loads hauled in a two horse wagon increased materially after the roads were improved, and ton-mile costs dropped from 30 cents to 13.7 cents. This meant a gross ton-mile saving of 16.3 cents, or a net ton-mile saving, when charges were made for interest on bonds and maintenance of roads, of 14.9 cents. Similar examples could be enumerated from all the other districts included in the study.

Following the completion of good roads in a community the motor truck, as a medium for the carriage of farm products, assumes a permanent place in the general scheme of transportation. It is proving of special value in solving the problem of the short haul, one of the most difficult ones which confronted transportation experts during the last decade. The steady growth of our larger centers of population and their increasing demands for larger quantities of food have stimulated the development of producing areas adjacent to these consuming centers. These producing areas have been pushed farther and farther from the centers of population by the encroachment of the city proper. Gardeners and dairy farmers who a few years ago were faced with a short haul to the nearby market now find that the horse drawn vehicle of other days is entirely inadequate to cover the increased distance to market. Here the motor truck has offered itself as a transportation medium capable of working effectually within a much wider radius than the horse and wagon. The development of rail facilities for the short haul has not kept pace with the development of crop producing districts near the larger centers of population, and the necessity for double handling when the railroad is used often results in increased cost and excessive loss in certain classes of perishable commodities. With the truck a load can be carried from producer to consumer with only one handling. The average dairy farmer uses trucks to carry his milk to the distributing centers in the city, and by maintaining regular schedules it is possible to make these deliveries in less time and for less money than under old conditions when part of the journey was made by train. The milk is delivered in better condition, too, for during the hot days the trucks are covered and the cans protected from the glaring sun or else the runs are made during the night when it is cooler.

The truck gardener is likewise using trucks to carry his fresh vegetables to market, and with good roads he is able to carry capacity loads, often hitching a trailer behind the truck where no steep grades are encountered.

In rural districts which are pretty well built up, and where a variety of products are available for hauling, a number of commercial routes have been established and regular rates charged for hauling. The trucks operate on a regular schedule and the farmers bring their produce to loading stations along the way, where it is picked up by the truck on its way to the city. On the return trip the merchandise deliveries of the city stores are taken care of.

As an example of the enormous tonnage which can be handled by a single truck when in constant operation, the case of a six ton motor truck, entered in a national truck efficiency test by the Pennsylvania Utilities Company of Easton, Pennsylvania, is interesting. In three months this truck hauled enough freight to make up six trains of 50 cars each, or the equivalent of a train three miles long. The truck was in operation 92 successive days and nights and transported 11,827 tons of coal, ashes, sand and brick. The daily average was 128 tons, or the equivalent of three freight cars of 40 tons capacity. The truck covered a total distance of 7,851 miles during the test.

In Iowa a number of commercial truck routes have been successfully established, some of them operating in and out of cities within a radius of 85 miles. The trucks haul all sorts of farm products, including livestock, as reports show that in Iowa over 158,000 hogs, 18,488 cattle and 37,130 sheep were moved by trucks in 1918.

In a trial trip made from Mason City, Iowa, to Albert Lea, Minnesota, a distance of 42 miles, a three-quarter ton truck carrying 2,800 pounds and a one and one-half ton truck carrying 3,300 pounds made the round trip in a driving storm in six hours and 40 minutes, at an expense for both trucks of $24.80, including depreciation and interest. It is said that there are almost 400 motor trucks operating regularly in Iowa over established routes.

In Maryland we have an example of a successful cooperative truck service, known as the "Farmers Cooperative Company of Harford County, Incorporated." This association appears to have met the needs of the community it is serving in a very satisfactory manner, and at the same time has eliminated effectively the problems of profit and destructive competition.

The association operates in Harford County, Maryland. Its motor trucks provide a daily round trip service from Churchville and Bel Air to Baltimore, taking milk and other farm products to Baltimore and bringing back to the farmers feedstuffs, salt, seeds, fertilizers, farm implements and other articles for use on the farm, together with merchandise shipped from the wholesale houses of Baltimore to members of the association. The distance covered by the route is about 60 miles.

The territory served is a very productive agricultural region, many of

(Continued on Page 171.)

California's Use of the Motor Truck

By C. B. Messenger

CALIFORNIA highways have encouraged the extension of automotive transportation and, as a rule, to the advantage of producers. Generally, large quantities, carlots or more, and for long distances, are still handled by the railways, but the handling of smaller quantities has induced the extension of the use of auto trucks in every section of the state. Running between Los Angeles and Bakersfield during one week there were counted 264 auto trucks, many with trailers, or an average of 37.6 per day. The average load was about three and a half tons per truck and trailer. All told, there are 1,032 carriers conveying freight from Los Angeles to outside points. Doubtless traffic out of Fresno, Stockton, Sacramento, San Francisco and other distributing centers of the state is proportionately as great, but we have been unable as yet to secure the figures. These figures have nothing whatever to do with the passenger traffic, which calls for an even greater number of machines.

Something over nine per cent of these trucks were registered and under the jurisdiction of the state railway commission, and therein is cause for somewhat of contention on the part of the large operators. Companies of individuals which establish a regular schedule between cities or between a city and interurban points are compelled by the auto stage and truck transportation act of 1917 to register and file with the railway commission schedule of charges, dates of regular service, amount of capital invested, and, in fact, complete statement of their business. Once installed, companies are compelled to continue regular service and, within reasonable bounds, exactly on schedule as filed with the commission. Then comes the fly-by-night, or irregular expressman, and hauls special loads, sometimes at less than the rate charged by regular installed companies, and these companies are forbidden to meet the cut, at least without permission from the state commission. This creates a condition which is hardly fair to regular established transportation business, but, at the same time, the highways are public property and regulation of this carrier service with entire justice and to the satisfaction of all seems very difficult.

These questions of regulation, however, concern Cultivator readers but little, at least so long as fair transportation rates on products from producing to consuming centers are maintained, and this makes up the greater portion of the business of these carriers. For instance, there is daily service of trucks from Fresno and other portions of the San Joaquin Valley carrying dairy products alone to Los Angeles.

But there is another form of truck service which is more particularly dwelt upon by Mr. Dahl in the article which follows. This is the service on the farm or from the farm to warehouse, elevator or nearby distributing point. This calls for individual ownership of trucks, but where there is scarcity of capital or insufficient business to justify one farm's ownership of a truck then comes cooperative ownership.

One trouble in California specialized community production, however, is the fact that the service is heavier comparatively during a small portion of the year. For instance, take an apricot producing community. A period covering, perhaps, six weeks would call for heaviest service of the trucks, while the remainder of the year the service would be extremely light if required at all. Incidentally, we may remark that this is a proof of the wisdom of diversified farming. However, the purpose of this article is not to fit the farming to the implements, but the reverse. We still believe there is opportunity for the apricot grower to unite with the prune grower, the raisin grower, the dairyman and others to secure through minimum expense maximum service. In any case, there is opportunity for farm bureau meetings to discuss how cheaper transportation may be secured by the farmer.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

When lemons are not worth anything, so far as net cash to the grower is concerned, and culls are worth less, their economical disposition becomes a prime factor. The citric acid factories have been of material value to the lemon industry during the past two years and have made thousands of tons of cull lemons into a high grade product shipped to all parts of the country. The price paid for the lemons has been around $20 a ton, but this left little to the grower after payment of freight and handling costs. When freight rates were raised the situation was still further complicated. Lemon orchards only 50 to 100 miles from the factories found it practically impossible to transport their fruit, then entered the motor truck and gasoline did the job, saving a net of $3 per ton in one of the largest lemon growing sections. Three dollars a ton is not much, but it means much to an industry already prostrate.

* * *

Another relief from excessive railway rates has been given in small measure by water shipments. Another week we hope to have a story of oranges to Philadelphia by way of the Panama Canal. This fruit was shipped about the middle of January and so far as any reports have yet been received, arrived in good condition. Meantime another and longer shipment has been made of California Navel oranges, this time from Los Angeles harbor direct to London. While the Philadelphia shipment required 15 days to arrive at destination, the London shipment will require about 33 days, but the perfect control of refrigeration on shipboard, it is thought, will make up for long time in transit.

* * *

"The Southern Tariff Congress is perhaps the first movement in the history of the South that meets with the unanimous approval of all political, agricultural, industrial and commercial factions." This is the statement of the Southern Tariff Advocate, organ of the Southern Tariff Congress. Excepting for an effort in congress to make political capital out of the present situation, there is little partisanship in the present protective tariff movement. As one speaker has said, "It is no longer possible to speak of a tariff for revenue only in the sense that we were wont to speak of it in the past." Certainly the revenue needs of the government at this moment are such that a good stiff tariff can be put upon all things produced by farmers and still work no injustice on anyone.

* * *

The emergency tariff bill now before congress is intended to give justice and an opportunity to dispose at home of surplus stock of American producers. Fortunately, this measure is receiving fullest support of our ablest senators and representatives. It has passed the house and, as we write, it has fair promise of passing the senate with a number of amendments. The reproduction of telegrams on the cover of this issue is given in the hope that it may prove a reminder to many of our subscribers to use the wire to encourage renewed effort on the part of our friends in the senate.

* * *

Just as a reminder about "Who Pays Taxes." We discussed this question somewhat in last issue, calling attention to the defeat of the taxation measure. The state legislature has adjourned and there is nothing doing, not above board, at least, until February 24. Farmers who are not anxious to have the matter of taxation come back to themselves might look over the list of "Noes," and if any assemblyman is found to be in wrong his name should be placed on the calling list. Without question the bill will be reintroduced, or rather the whole question reconsidered, and an opportunity given those who did not fully understand the question before to vote right.

* * *

The trouble with a lot of essential legislation is that it becomes involved in such an awful mass of stuff included in the 2,000 bills introduced that it is impossible to secure sane treatment. There were introduced in the lower house 1,200 bills and in the senate 800. It is stated that practically all the bills which have been introduced and defeated for several years have been reintroduced.

* * *

One little economy which is promised to us by the federal congress is the saving of $363,000 in the free seed fake which has been fastened upon the country for a period of somewhat less than a century. This free seed stunt has given the congressman opportunity to think that he was pleasing his constituents by sending stuff of no agricultural value and yet with it carrying the idea that the aforesaid congressman had the individual voter's best interests so at heart that he was sending him a memento of great value. It is said that this custom has cost $828 for the district of every congressman. If there is a single district that ever got 828 cents worth of good seed it should be reported for the Congressional Record.

* * *

York state dairymen are using the movies to educate consumers of milk as to the value of the purest and best food on earth. It is done through the Milk Queen Fairy story, with much of fiction and more of truth. The Milk Queen Fairy is the heroine and other little fairies who live in the Milk Castle are Billy Lime, Chubby Butter, Susy Sugar, Fairy Ice Cream. Another character, who is a giant, is Vitamine. He is a for-sure full grown fairy of wonderful strength. The movies afford opportunity for education possessed by no other agency in our country today, but this agency has been so painfully abused that its influence is largely in the wrong direction. There is no call for a goody-goody moral to everything that goes on the screen, but there is call for reduction of some of the vice suggestions in too many of the reels. As we recently heard it expressed. "The time has come when the country should capitalize virtue and cease capitalizing vice as has been done so long."

THIS WEEK'S COVER

The larger business interests of the country realize that if maximum production is to be secured during the next crop producing season there must be given the farmer a reasonably stable market and assurance of prices which will at least cover costs. A situation much more serious than is admitted by many confronts us. Probably the great majority of the farmers of the United States are unable to dispose of their 1920 production at sufficient to cover its actual cash cost. Elevators and warehouses are still overfilled; transportation companies find it difficult to move the products and, worse than all, foreign exchange and financial conditions are most embarrassing.

Would-be political economists are presenting thousands of suggestions, but little action has as yet been taken. Congress has, however, started something and are considering what is known as the Fordney emergency tariff. This measure was taken up immediately on the convening of congress and before the end of December had passed the house. It then went to finance committee of the senate, and its troubles began. It has now been reported out and is on the floor and amendments almost by the score are being proposed. Some of these are simply the addition of agricultural products to the protective list; others are intended to embarrass and cause the death of the entire measure.

Partisanship has entered into the fight to a certain extent, but very fortunately the South comes up with its claim for protection and partisan opposition is almost a thing of the past. The wires are being kept hot to Washington, and the Cultivator has endeavored to represent California farmers by sending wires, as may be seen by reproduction on the cover, to two California senators and to Senator Penrose, chairman of the finance committee and one of the strongest boosters for this protection to America's producing interests.

DO IT NOW

The Agricultural Publishers Association has set aside a week to be considered on the part of the producers of the country as National Repair Week. Or, rather, there are three separate weeks, one to be observed in each of three zones. It is announced that the first zone observed January 31 to February 5; the second zone, February 29 to March 5; and the third, April 4 to 9. Which zone California or any other state is in we are not informed as yet, but we think the suggestion valuable enough that it is well worth the California producer's time to immediately take up the observation of National Repair Week. The idea is to overhaul plows, disks, drills, mowers, reapers, tractors, in fact, all implements in use on the farm—when they are not in use—paint, restore lost parts, where necessary order from factory or dealer, and have everything in shape for the campaign, which may not begin for some weeks. It is hoped by this campaign to induce not only greater production on the part of the farmers, but to encourage dealers to get their repair departments stocked up with all necessary parts and so prevent the crowding of all repair business into limited harvest or other short season.

Do it now; don't wait for the busy season.

SUPREME COURT DELAY

We are going to let William J. Bryan write this editorial. We regret that he has been a bit thoughtless and used it first in The Commoner, but that is immaterial, for he says so emphatically and so truly some things regarding certain interests causing the downfall, or at least great embarrassment, of the federal farm loan that we quote his editorial entire:

"The delay of the supreme court in deciding the case testing the constitutionality of the farm loan bank law focuses attention on a situation no longer bearable. Many months ago a group of interested parties brought suit to test the validity of the law establishing the farm loan bank. The farm bank interfered with interest rates and commissions of the banks and insurance companies, and the suit suspended competition. They have already profited, but they have brought an enormous loss to the farmers. The suit ought to have been heard and decided at once. Every day's delay has cost the farmers hundreds of thousands, if not millions, of dollars, while it has enabled banks and insurance companies to raise interest rates and commissions.

"Remedies are never applied until suffering compels action. The farmers have suffered enough to justify a demand for legislation giving to such cases an immediate hearing and requiring the court to render a decision within a reasonable time.

"If the federal farm loan bank act is unconstitutional, congress and the people can remedy the defect. If the act is constitutional, unreasonable delays are exasperating and very harmful. It is to be regretted that the supreme court docket is so choked with business, but provision should be made that cases of great public importance could be determined without delay.

"Where a few having a pecuniary interest adverse to the interests of a multitude, attempt to invalidate a law, the law ought not be suspended during the hearing unless the complainants protect from loss those who may suffer while the case is being heard. Here is an opportunity for senators and members of the house to render a real and permanent service to their constituents."

RELIEF FOR THE GROWERS

The railroads are not going to lower the freight rate unless forced to, and neither pussyfooting nor withholding shipments and allowing produce to rot on the farm will force a reduction. Meantime the consumer is paying practically the same old prices. In advertisements and otherwhere there is continual reference to reduction in the cost of living, but in actual purchases the home maker is as much embarrassed as ever. The larger cooperative organizations must take the initiative for railway and commerce commissions are having pressure brought to bear to raise rather than lower the rates. Touching this matter of rates, the Tampa, Florida, Tribune says:

"One of the most direct and far reaching steps toward reducing the high cost of living has been taken by the Florida Citrus Exchange in its movement to have established an 'emergency freight rate' for all food crops that must be moved by rail or water. It is also the most unselfish movement that has been started in the country since the war began. The West demanded relief for its wheat, and the cotton states demanded relief for their cotton. The Florida Citrus Exchange demands, and shows how it can be given, relief for every man, woman and child in the country.

"It is almost impossible to estimate the excessive charge total for the movement of foodstuffs in the country now over pre-war rates, but the Exchange shows that in the one thing of Florida citrus fruits alone the excess is above five and a half million dollars on this season's crop. What it will amount to for the vegetable crop of Florida for the year can hardly be given, as there is nothing to gather the exact statistics of this industry as there is for the citrus. But it is evident from the amount of perishables shipped annually from Florida that the total for the citrus crop will not exceed that for other perishables.

"The country needs every possible assistance in its getting down off the stilts of excess costs for everything. The mere cutting of wages will not help any, if labor is forced to pay the same high price for living needs. The railroads have been given all demands they made in the shape of guarantees of earnings and are now cutting down labor costs and number of employes. It is entirely logical that if the railroads reduce their expenses they should accept reductions in rates to even up things all around.

"With volume of business increased, with freight rates 40 per cent or more advanced, and with wages cut 20 per cent, and roll of employes cut ten per cent, it follows as a reasonable sequence that freight and passenger rates should be lowered in a just proportion.

"The railroads called for an emergency increase and got it. The food producers and shippers of the country need an emergency decrease in freight rates, and should have it.

"The press and the entire representation in congress of this state should get back of this Citrus Exchange proposition for the relief of the country and make it a special charge until it is granted. Unless it is granted, Florida farmers and growers stand to lose in crops which cannot be handled because the excess rates of freight will be the difference between profit and loss to the grower."

TEHAMA COUNTY FARM BUREAU MEETINGS

The regular meetings for the farm centers of Tehama County are scheduled as follows for February: North Capay, 2; Henleyville, 4; Squaw Hill, 7; Dairyville, 9; Antelope, 10; Oak Park, 11; Corning, 17; Bend, 18; Richfield, 21; Proberta, 23 Liberal, 24; Manton, 25; Bowman, 26; Los Molinos, 28. Directors meeting, 26, 10:30 a. m., Red Bluff.

PLANTS IN MARKET

A canvass of seed stores discloses plants and roots for sale as follows and may suggest to readers something needed in the garden which it is now timely to plant.

In economic plants: artichoke, asparagus, cabbage, chayote, horse-radish, lettuce, onions, parsley, rhubarb and Swiss chard. In ornamentals: Canterbury bells, carnations, larkspurs, pansies, poinsettia (dormant rooted cuttings), stocks, verbenas and violets. Suggesting arbor covers are grape vines, evergreen raspberries, thornless raspberries and rambling blackberries.

MISTAKE TO BE AVOIDED

An early morning customer in an optician's shop was a young woman with a determined air. She addressed the first salesman she saw:

"I want to look at a pair of eyeglasses of extra magnifying power."

"Yes, madam," replied the salesman; "something very strong?"

"Yes, sir. While in the country I made a very painful blunder which I never want to repeat."

"Indeed! Mistook a stranger for an acquaintance?"

"No, not exactly that; I mistook a bumble bee for a blackberry."—Unidentified.

Why Case Tractor Bull Gears Resist Wear and Breakage

CASE Tractor Bull Gears are made from high carbon steel billets, forged into one-piece, weldless rings. The method of manufacture — Case patented — is such that only steel absolutely free from flaws and defects can withstand, successfully, this process. If there is going to be any breakage, it occurs *in the factory*, before the gear is completed — not after it is on the tractor and the machine working in the field.

Hydraulic forging, annealing, heat treating, tempering in an oil bath, machining and cutting teeth to the accuracy of less than the thickness of a human hair — each of these important steps in the process of manufacturing Case Tractor Bull Gears contributes materially to the true-running qualities, smooth operation, and long life of Case Kerosene Tractors.

The wear-resisting hardness, breakage-defying toughness, and permanently perfect mesh of Case Bull Gears, are features characteristic of Case manufacturing thoroughness in all details.

Decay of Citrus Fruits in Transit

By O. F. Burger, Florida Experiment Station

WITH most fruit it takes 51 weeks to produce a crop and one week to market it. In this one marketing week 51 times more care should be taken than in any one of the previous producing weeks. However, here is where many growers fail—they take less care in marketing their fruit than in growing it.

During the fall and winter of 1918-19 from 10 to 15 per cent of Florida fruit decayed on the way to market. This was a loss of at least 890,000 boxes of fruit. This decay was due largely to blue mold. It has been shown repeatedly that this decay is not caused by inherent weakness of the fruit, but by bad handling. During the war it was impossible to obtain good help, but that condition has been remedied and good labor can now be obtained. Scientific workers have proven that a wound in the fruit is necessary before blue mold fungus can enter.

The foreman of the picking crew is responsible for much of the decay. It is his business to see that each picker leaves no long stems or makes clipper cuts. He must also examine field boxes and see that all protruding nails and splinters are removed and sharp corners rounded. Care must be taken in emptying the fruit from the picking bags that the fruit is not injured. As far as results are concerned, every injured fruit is a rotten fruit.

In the packing house the fruit must not come in contact with sharp edges of machinery. Washers and bins must be so constructed that the fruit is not crowded or given violent motion. The packers must wear gloves to avoid injuring the fruit with their finger nails.

Blue mold fungus lives on organic matter. In many groves dropped and split fruit are sources of infection. Mashed fruit and culls left lying about in the packing house furnish ideal conditions for the multiplication and growth of blue mold. All drops in the groves should be removed. Packing house and field boxes should be cleaned. Crushed fruit and culls should be kept out of the packing house.

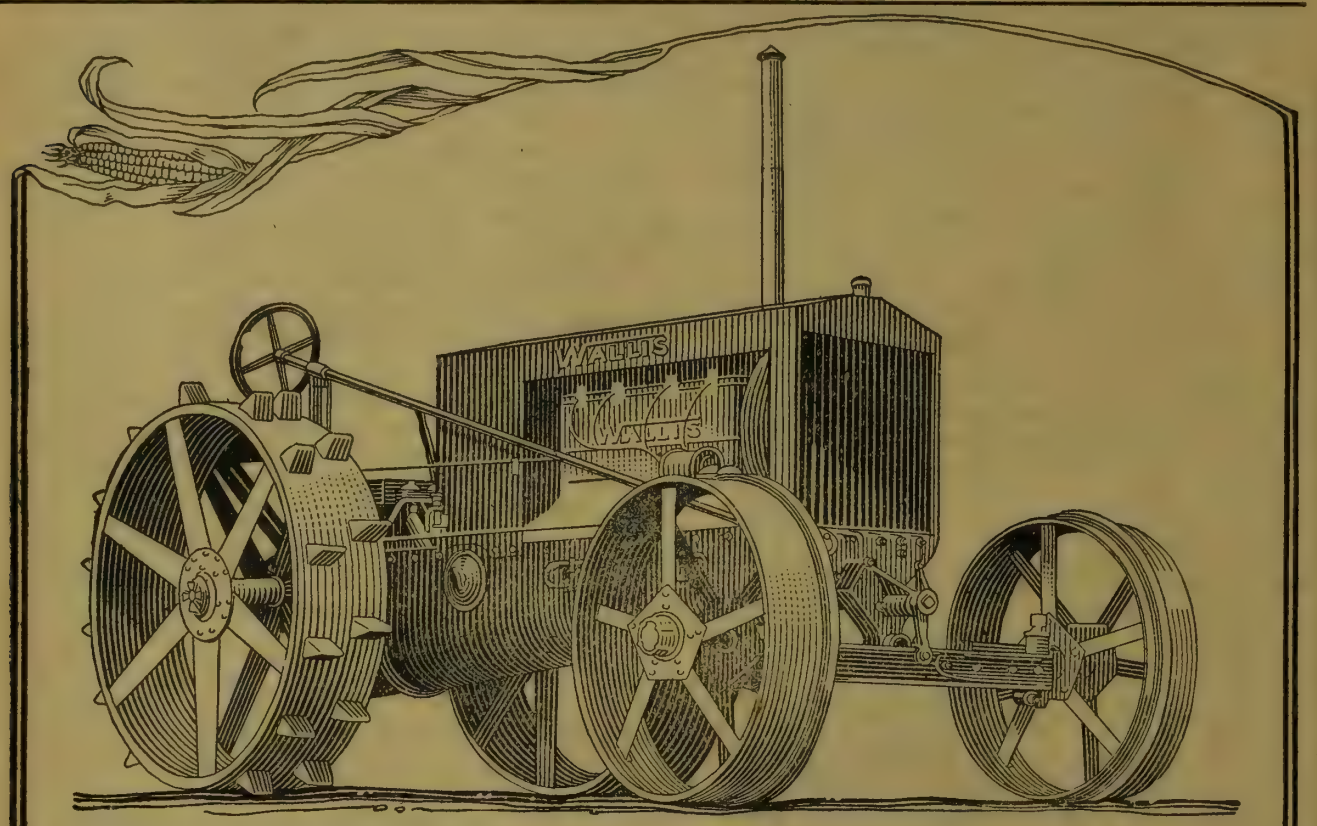
Most fruit is sold by auction companies. Each lot is graded and sold according to general appearance and the amount of rot. A few decayed oranges will greatly affect the price. A little care at the time of picking and packing will make a great difference in the returns.

Several years ago the cause of this decay was not fully understood. Many theories were advanced by growers and shippers to explain their losses. Some attributed the decay to the influence of a certain type of soil, causing a possible degeneracy in the fruit as the trees grew older. Others believed it to be due to climatic conditions, such as fogs and rains. Many thought it due to inherent weakness of the fruit. Some believed it due to faulty methods used in packing houses. All believed and agreed that improper and inadequate transportation was largely the cause of the decay.

A certain grower in Florida was losing 30 per cent of his fruit in transportation. He thought it the fault of the railroad companies. He found by investigating that it was due to clipper cuts and long stems.

Railroad companies are not responsible for decay, if cars have been properly handled during transportation. They have a right to fight claims for loss in such cases.

If the produce arrives on the market in an unsightly, decaying mass, it sells as such. Good fruit sells for less if there is decayed fruit in the same box.



WALLIS—International Champion

Once again has the Wallis Tractor offered convincing proof that Wallis power means "more acres per hour." In the great international demonstration held recently by the ROYAL AGRICULTURAL SOCIETY OF ENGLAND, the Wallis performed with such thoroughness and power that it was awarded the FIRST PRIZE AND GOLD MEDAL in the three-bottom plow class. The trials lasted seven days and covered every phase of field and belt operation.

The leading English engineering journals, commented very favorably on the constructional features of the Wallis—AMERICA'S FOREMOST TRACTOR. Its sturdy strength, light weight and remarkable pulling power were commended. The famous Wallis U-shaped frame, made of one-piece boiler steel, was the object of especial approval among the judges and engineering experts. The low-speed, heavy-duty motor; compact, dustproof construction, and non-friction bearings, were other features that received high praise. Wallis was accorded unquestioned leadership in the three-bottom plow class.

"More Acres per Hour" is built into every vital part of Wallis. Thousands of farmers throughout the country have increased their production and lowered their costs with the Wallis. Its great power and trouble-free performance add many dollars to the value of the crop. A visit to the nearest Wallis dealer will convince you of the merit of Wallis.

J. I. CASE PLOW WORKS COMPANY, Dept. A3121, Racine, Wisconsin

WALLIS
-more acres per hour

NOTICE: We want the public to know that the WALLIS TRACTOR is made by the J. I. CASE PLOW WORKS COMPANY of Racine, Wisconsin and is NOT the product of any other company with "J. I. CASE" as part of its corporate name.

BETTER WALNUT SEED

Falling in line with the "Better Seed" movement which is sweeping over the country, the California Walnut Growers Association is making an effort this year to get high grade black walnut seed into the hands of nurserymen and ranchers in order to lay the foundation for better trees upon which to build the future of an already great industry.

It is a well known scientific fact that a highly improved breed of stock or variety of trees is somewhat tender, and it has been learned that the best way to offset this tendency is to cross the animal or tree with rugged stock. That is why some of the best orange trees result from grafting improved varieties on what is termed "sour stock."

From a long series of experiments it has been learned that California walnuts of the soft shell variety do not produce sturdy root stock, and experimenters have ascertained that the finest walnut trees in the world are developed by budding the improved varieties of walnuts onto wild or black walnut root stock.

To breed the best type of walnut tree the association thinks it wise for nurserymen and ranchers to obtain the genuine Northern California wild black walnut as a foundation. Last year a quantity of wild walnuts were secured by the association for distribution among the growers, and they were gobbled up with such suddenness that many ranchers did not even get the proverbial "look in" on the campaign for better root stock.

This year the association has gone into the Santa Clara Valley, where the finest type of black walnut grows, and has secured a limited quantity of carefully selected wild walnuts, for sale to the associated growers at cost. This means a price of 12 cents a pound f. o. b. Los Angeles.

The black walnuts are being offered to ranchers and nurserymen at this price, while they last, purely in the interest of better root stock for a stronger generation of California walnuts. Complete instructions for planting and growing are supplied with each shipment.

Carlyle Thorpe, general manager of the association, urges those who desire an allotment of this wild walnut seed to place their orders within the next 15 days to avoid possible disappointment later in the season.

PROGRAM FOR CITRUS INSTITUTE

The annual meeting of the California Citrus Institute will be held at the Elks Club rooms, San Bernardino, February 25 and 26. In addition to the splendid, practical program that has been arranged, there will be the treasurer's report and the election of officers for the ensuing year. Three of the directors' terms expire, including those of C. C. Chapman of Fullerton, J. H. Strait of Redlands and Judge Curtis of San Bernardino.

Friday, 9:30 a. m.—New Information Concerning Control of Insect Pests in Citrus Orchards: Fumigation versus Spraying, J. A. Prizer; Possibilities of Fumigation with Gas Tight Tents, H. J. Quayle; Black Scale Control with Parasites, H. S. Smith. 2 p. m.—Traction Power for Citrus Orchards: Experiences with Tractors on Rancho Sespe, W. H. Fleet; Comparative Costs of Tractor and Horse Work, C. A. Griffith; Cooperative Use of Tractors on Small Citrus Units, J. A. Dennis.

B T S

The dry Barium-Sulphur insecticide and fungicide, in which both the barium and sulphur are available as active ingredients, due to the combination which greatly increases the efficiency of each.

B T S is remarkably effective in killing scale insects, red spiders, etc. It is the spray material to use during the dormant season. It possesses a stability that cannot be secured in dry compounds of either lime or soda with sulphur. B T S is more dependable as a spray and less liable to cause injury to plants.

B T S in powder form carries a higher percentage of sulphur than the crystalline product. Leakage is eliminated. 80 per cent of the weight is eliminated. B T S is practicable and is winning its way by the results obtained. We have watched its effects in California orchards, proving each step and unhesitatingly recommend it.

B T S is economical when used at a strength that will be effective. As a dormant spray it will do all that the solution will do. Recent tests indicate that as a fungicide for growing period it possesses certain properties that make it even more valuable than the solution. It is safe to use and easy to dissolve. These statements are based on the results obtained by some of the most successful producers of fancy fruit in the country.

B T S destroys scale insects; controls peach leaf curl and twig borer; controls apple and pear scab; may be used in combination with arsenate of lead; saves 80 per cent of the bulk as compared with lime-sulphur solution; dissolves readily in water; is economical, convenient and effective.

Other tree-spraying materials manufactured by us and proved effective by long use on this Coast are:

FREEZING CITRUS PESTS

In a comprehensive article in the "Florida Buggist," W. W. Yothers tells of the effects of the February 2-4, 1917, freeze on citrus pests. The citrus bearing sections are divided into three zones, based uopn temperature records of the United States weather bureau. It is necessary for us to consider only zone one for the reason that only in that zone were pests like the white fly practically exterminated.

"In the first zone, comprising the citrus producing counties of Putnam, Volusia and Marion, with parts of Lake and Orange, in which the temperature varied from 15 to 20 degrees Fahrenheit, there was practically complete defoliation of all citrus trees, many pomelo trees were killed to the ground and oranges were killed back to within four to eight feet of the ground. While the citrus white fly survives on privet in the temperatures of North Carolina, and the recent cold wave did not injure this species in Florida, the defoliation of the citrus trees resulted in reducing the number in many places and localities to the point of almost complete extermination, particularly in zone one. The cloudy winged white fly, which infests only citrus and is found largely on pomelo, was destroyed only in proportion to the extent of the defoliation. The purple scale was almost exterminated in the counties of zone one, but the eggs were not sufficiently frozen to keep them from hatching. The red scale on camphor (Chrysomphalus aonidum) was injured in all stages except the eggs by the frost, and not one insect in 10,000 or more survived."

ONE-TREE ORCHARDS

Commercial growers of citrus trees report an increasing demand for trees bearing two or more varieties of fruits for use principally in city and village backyards. The strongest call in the past has been for a tree carrying three standard varieties such as a branch each of Navel orange, Marsh pomelo, and Eureka lemon. But the demand for greater variety is so strong that one may get them on various combinations up to six varieties on one tree and all seem to thrive. In fact there is a record tree in Los Angeles County that has been top-worked until it bears 22 named varieties, all the owner could find. These standard six-in-one now on the market are most interesting for students of plant life to watch in their development and also provide a wide variety of good citrus fruits.

GIRDLING TO PRODUCE FRUIT

The highest yield per acre will probably be gathered from an orangery where the trees were all girdled with wire during the last flowering season. If this crop can be taken as an average result to be obtained from either girdling or cincturing the Navel orange, and the health of the tree is not impaired by the practice, heavier yields of Navels can be looked for. This question opens up a fairly large field for experiment, as one cannot place much reliance upon one year's results.—Fruit World of Australasia.

GLENN COUNTY FARM BUREAU MEETINGS

TOP-DRESSING TALK No. 6

Does It Pay to Top-Dress Grain?

"Considering the state as a whole, it (the College of Agriculture) feels reasonably safe in saying that by the use of 100 pounds of *Sulphate of Ammonia*, an increase can be made of 6 bushels of wheat or 10 bushels of barley per acre, provided it is applied to land adapted through climatic and soil conditions to the crop in question." (*Professor Thomas Forsyth Hunt in California Circular No. 169.*)

ARCADIAN
Sulphate of Ammonia

Arcadian Sulphate of Ammonia is the safest and most economical carrier of nitrogen for California soils. In addition to supplying quickly available nitrogen in a non-leaching form it supplies an abundance of sulphur, a plant food element often lacking in California soils. It is *"The Great American Ammoniate."*

Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past.

Arcadian is the kiln-dried and screened grade, made fine and dry for top-dressing purposes. Ammonia 25¼ per cent guaranteed. Made in U. S. A.

ANTELOPE VALLEY PEAR GROWERS MEET

On January 28 the pear growers of the valley held a very interesting meeting, with a varied program, touching all phases of farming in that section. W. S. Rosecrans, secretary of the Los Angeles farm bureau, spoke on the subject of the farm bureau and the fruit grower, showing the value of the agricultural extension service. Rodent control in the valley was dealt with by L. S. Neville of the Los Angeles County horticultural commission. A talk and demonstration of fire trailer equipment was given by a representative of the county forester's office. Farm Advisor Hodgson made a talk on the technique of orchard spraying, which was followed by a field demonstration of spray materials, power spray outfits, spray guns, nozzles, etc., representatives of several commercial houses in Los Angeles taking part.

A printed schedule for Antelope Valley pear orchards was distributed. For dormant spraying in early spring at first signs of cluster buds swelling, spray with lime-sulphur one to ten, for scab and blister mite. If latter is absent use Bordeaux mixture 4-4-50. For the first codlin moth: As petals are falling, spray with lime-sulphur, three gallons, water to make 100 gallons, one-half pint black leaf 40, and either six pounds of basic lead arsenate paste or three pounds of basic lead arsenate powder, for blister mite, scab, thrips and codlin moth. If red spider is present, use instead of lime-sulphur, five pounds milled sulphur or ten pounds atomic sulphur to 100 gallons watter. For second codlin moth: repeat 20 to 30 days later.

CITRUS CROP FOR 1921

The Riverside Press estimate of the coming crop shows a grand total of 53,000 carloads of citrus fruit from the state. This is divided as follows:

	Oranges	Lem.
Southern California	39,500	8,700
Central California	4,300	200
Northern California	300	.....
Total for state	44,100	8,900

The various districts of Southern California, according to the detailed estimates, will produce and ship from the various sections as follows:

	Oranges	Lem.
Pomona district	4000	300
Orange district	3500	1000
Riverside district	3500	400
Azusa-Glendora district	3500	250
Ontario district	3100	1025
Redlands	3000	.....
Anaheim	3000	.....
Covina	2000	.....
Highland	1900	125
Whittier district	1650	850
Placentia	1500	100
San Dimas	1400	700
La Verne	1200	100
Rialto-Bloomington-Colton	1150	60
Fullerton	900	.....
Corona	800	725
Ventura County	700	900
Alhambra district	600	.....
Duarte-Monrovia	600	.....
La Habra	400	350
San Fernando	300	400
San Diego County	240	900
Moreno	185	.....
Hemet	100	.....
Santa Barbara County	.....	400
Other localities	275	115
Totals	39,500	8,700

The estimates have all been made on the basis of full carloads which are running now about 462 boxes to the car. Where the estimates were sent in on the basis of 400 boxes to the car, they have been refigured on the full car basis.

STRAWBERRY ROOT WEEVIL

In reply to telegraphic inquiry concerning the areas in Oregon infested with strawberry root weevil and the possibility of the Oregon authorities certifying to point of origin of strawberry plants shipped from Oregon into California, the following telegram was received November 10 from President Charles A. Park of the Oregon board of horticulture:

No strawberry infestation south of line running east and west through town of McMinnville. Anything south of this line may be passed with safety. Shipments can be certified as originating in non-infested area.

In view of the impracticability of inspecting with assurance of safety strawberry plants from the infested area, and considering the value of the strawberry plantings in California, the director of agriculture has signed Quarantine Regulation No. 8, which is now in full force and effect.

PLANNING AND PLANTING A VINEYARD: PHYLLOXERA

(Continued from Page 163.)

France and in this state, that it is possible to kill both the insect and its eggs without injury to the vine, if they are immersed in hot water, held constantly at 125 degrees Fahrenheit for a period of from three to five minutes. This method of disinfection is now generally accepted as satisfactory, and most of the nurserymen and large growers of rooted vines are using it on all the vines they are offering for sale. This work to be effective must be done under careful supervision, and such supervision is given by the county horticultural officials. After the dipping has been completed to avoid possible danger these officials are adopting a system of sealing each bundle of vines or each shipment which guarantees that the vines so sealed have been disinfected in the proper manner. So far as it goes, this method is satisfactory, but it is still up to the prospective grower to insist upon disinfected vines, as there are thousands of vines grown as a side line in all parts of the state which may be transported by automobile or truck from one district to another. The horticultural officials are almost powerless to check this movement without the hearty cooperation of all persons in the county or district over which they have jurisdiction, and it is

Figures of Interest to the Growers of Canning Fruits

The pack of canned fruits in the State of California measured in cases during the past several years was as follows:

1909 to 1913 (Average)	4,083,465 cases
1914	5,968,875 cases
1915	5,731,166 cases
1916	7,021,975 cases
1917	9,995,145 cases
1918	8,943,737 cases
1919	13,696,403 cases
1920	11,382,863 cases

In other words, we have a production from 250 to 300 per cent greater than before the war.

Prominent canners estimate that 6,500,000 cases of the 1920 remain in cannery warehouses and that 5,000,000 cases are unsold today. In an effort to move these tremendous surpluses substantial reductions in prices have been made which in the face of the highest prices ever paid for fruit and sugar means that the canners are absorbing heavy losses. Even with these reductions in prices it is doubtful if all these canned fruits will be out of the way before the next fruit season, even though export markets should be opened.

Production of Fruit is Increasing
Construction of New Plants has Stopped

The situation calls for concerted action by the growers of canning fruits. Co-operative Marketing alone will solve the problem of distribution of our increasing production. Heroic efforts are necessary and action must be taken immediately to avoid disaster this coming year.

Our organization furnishes the nucleus for this co-operative effort to retrieve one of California's greatest industries from a most dangerous situation.

SIMPLE METHOD OF SMOKING MEAT

By L. D. Johnson

In a few minutes anyone can smoke a season's supply of meat without bother or loss. The secret is in using Wright's Smoke, which may be applied quickly, easily and cheaply with brush or cloth. Wright's Smoke is made of smoke from selected hickory and gives a delicious flavor. It saves 20 pounds out of every 100 by preventing shrinkage. If you want delicious smoked meat at less cost and less trouble, get a bottle of Wright's Smoke from your druggist today—big bottle $1.25. For sugar-curing meats you can do away with the trouble of mixing the ingredients and save time and money by using Wright's Ham Pickle, which contains all the necessary ingredients in proper proportions. Simply mix a bottle with 27 pounds of salt, which will cure a barrel of meat.

Get these genuine, guaranteed Wright Food Products from your dealer. If he can't supply you, write E. H. Wright Co., 839 Broadway, Kansas City, Mo., for free booklet.

plainly the duty of everyone to advise the proper officials if they learn of the movement of rooted vines which they have reason to believe have not been properly disinfected.

In the meantime the horticultural officials are giving this question a great deal of thought and it is probable that before another season rolls around a system of inspection or some method of disinfection will be perfected which will eliminate all of the chances of anything getting by. Until that time these facts are worthy of the very serious consideration of every grower, and particularly those who are developing acreage in the so-called new districts.

Light Soils Do Not Guarantee Immunity

Before drawing this article to a close it might well be mentioned that, contrary to the popular opinion that phylloxera will only be found in the heavier types of soil, it has recently been found in quite sandy soils, so that it is now believed that no soil is entirely exempt. It is true, however, that the spread is much more rapid in the heavy soils, and probably the infestation is more serious to the vines. The only really safe way is not to take chances. Either be sure to plant rooted vines which have been disinfected or use cuttings.

MOTOR TRUCK AND TRANSPORTATION

(Continued from Page 165.)

the members operating dairies while others raise truck or general crops for the city markets. There is but one railroad which serves the district. Prior to the appearance of the commercial motor truck the farmer hauled his product by team to the railroad or to Baltimore. For the farmers living off the railroad this often meant the loss of a team and driver for at least half a day. Where the trip was made to Baltimore it required at least two days' time for the round trip. Several years ago some of the more enterprising farmers of the district bought trucks which they used to haul their supplies to Baltimore, but the average small grower could not afford to do this. Then a young truck owner established a commercial route, picking up milk and farm produce along the road and hauling it to Baltimore. This was more or less of a success, but when he attempted to raise his rates the farmers of the neighborhood got together and organized a cooperative corporation under the name already referred to. Each incorporator took stock in the concern, and the affairs of the corporation are managed by a board of directors.

The association operates several trucks, of two ton and four ton capacity, in charge of an experienced operator. An extra man goes along to do the loading. As the sole purpose of the service is to handle the products of the members without any return of profit the rates are changed from time to time, as experience shows they exceed or are less than the operating costs. A schedule has been prepared to cover the cost of transporting various kinds of freight, and milk takes a certain rate, apples another, etc. A surplus fund is kept by the association to cover replacement charges and extraordinary demands, and proper accounts are kept of all expenses of operation. Loading platforms, the same height as the floor of the truck, have been built along the route, to which the members bring their products, and these are picked up and delivered to their destination. The association maintains its own garage and repair shop where the trucks are overhauled after each trip.

The association has found that not only is it possible to haul their products at rates lower than paid in the past, but the service rendered is superior to that given by the railroad, as they escape the congestion often existing in express or freight shipments, and the loss of milk cans and containers has practically been eliminated. Under old conditions the annual loss from this source was considerable.

The coming years will undoubtedly see a great development in our motor transportation, for the field is a big one and presents opportunities alike to the individual farmer, the commercial truck operator and to the cooperative association.

Where Can You Find a Greater Opportunity Than This?

A Most Favorably Situated Tract for Walnut Growing, With Aqueduct Water, to be Sold in Acre Units and Developed as a Whole.

Priced to be One of the Most Desirable Land Investments You Could Find

Everyone knows that Walnut Land is scarce and valuable. There are only a few places in the world where climate conditions make growing of walnuts possible. The demand is increasing, indicating good, steady prices for the crops. The famous San Fernando Valley is one of the places where Nature has made it possible, in certain sections, for walnuts to be grown successfully.

Walnut groves soon come into bearing and thereafter, if properly cared for, yield big incomes on comparatively small investments.

I am going to develop and bring into bearing one of the highest class walnut orchards in Southern California and am taking this opportunity of extending an invitation to all readers of the Cultivator, who would like to participate in the ownership of such a walnut grove, located in the San Fernando Valley, under the Thirty Million Dollar Los Angeles Aqueduct water system, on the State Highway, in a highly desirable walnut section, to join me.

I am going to plant this tract at once to the highest quality budded trees under the direct instruction of the Field Department of the Walnut Growers Association, and am offering to you an opportunity to purchase units of one acre or more in this grove which will grow into value and be cared for while you are continuing your present occupation.

We invite you to call or write and learn all about this proposition. See the land, the valuable groves beside it and get prices at which some bearing groves near this have sold.

If interested write for an appointment to look over the land and investigate the proposition. More than half of the units have been spoken for. I especially invite walnut grove owners to see the property as the value is easily apparent.

Van Nuys, Cal. Telephone: 117 R 4

Highest Bank and Commercial References Furnished

February in the Ornamental Garden

Southern California

By Ernest Braunton

OF all months in the year February is the one best for planting, in either seeds, roots, bulbs or plants. It is the opening of the California spring. Buds are swelling or trees are blooming, bulbs are pushing up through the soil and all plant life except the tropical will be putting forth new growth. As nature will now manifest her activities and man may not stay them, we must keep up with natural processes and functions and garden with energy and enthusiasm. The laggard will fail of good results.

Rains have beaten the soil down hard, and if it is of heavy texture it should be well stirred and loosened, but only when it is dry enough so it will remain light and friable. Turn under liberal amounts of fertilizer and all fine small rubbish such as lawn clippings; heavier stuff may be composted or burned. As some pruning will be done, the clippings may be likewise disposed of. If rains still come, work up unused soil as soon as dry enough and leave in rough state until in condition to pulverize. It should not only catch, but hold, all rainfall, and yet be worked down smooth before the sun bakes it hard. In the pruning of ornamentals much material for propagation may be salvaged from the castaways.

Division and Multiplication

Get a box of sand or prepare a place in the garden where soil is lightest for a propagating bed. Do not shirk the proper preparation of such bed or failure will result. Drainage must be good and this may be assured only through deep digging so soil water may easily percolate below the zone of rooting cuttings, for permeation of air to the root zone is necessary to callusing and rooting. Cuttings of hardwood shrubs may be put in, such as crepe myrtle, deutzia, hydrangea, lemon verbena, lilac, philadelphus, snowball and weigelia. In cold sections a few put in rose cuttings, but late autumn brings better results. Rose cuttings should be shaded from sun for a month or six weeks and allowed to remain where rooted until next winter.

Many garden owners still divide carnations, chrysanthemums and violets, but all are best grown each year from cuttings, and now is the best time, though 'mums may be left until the latter part of the month. But golden rod, Golden Glow rudbeckia, larkspur, phlox and Shasta daisies are best divided and replanted. Some advocate division of German iris now, but it is the poorest time for it of all the year, September being a good month, for the roots then get an autumn growth which carries them safely through the winter. If disturbed now few blooms will be had and many roots will rot. After division of roots water well but once, unless weather is very warm, for a damp warm soil is preferable to a cold, wet one.

Sowing the Seeds

At this time of the year it would be more economical of space and paper to note what we should not sow than what with safety we may. All seeds of hardy or even half hardy annuals and perennials may now be sown; some of the resultant plants are autumn flowering. A few include asters in the list, but such early plants should be grown in partial shade or close to the cool or misty sea beach. But as many prefer a constructive program, the following list is timely: Acrolinum, allysum, antirrhinum (snapdragon), calendula, calliopsis, celosia (cockscomb), chrysanthemum (annual), cosmos, eschscholtzia (California poppy), gaillardia, larkspur, linum (flax), lupine, mignonette, nemophila (baby blue eyes and other species), nigella, pinks, poppies, salvia and sweet peas. In more tender plants sow in boxes in house or in warm sheltered spot: balsam, begonia, gloxinia, lobelia, pyrethrum (golden feather, etc.), scabiosa, salpiglossis, salvia (tender species), torrenia, petunia and verbena.

Bulbs and Tubers

Many sorts of bulbs of the early classes may still be sown with assurance of good results, though it is a little late for tulips. As the season is a backward one, all Dutch or Holland bulbs and those native to California still are dormant and should yield fine flower crops. Anemones, amaryllis, callas (several colors), daffodils and jonquils, narcissi), gladiolus, lilies (auratum, speciosum and natives of California), Japanese iris, ranunculus and tuberose are a few samples for February planting. Many now plant, outdoors, the following, but they are better held for the fourth week: Caladium (elephant's ear), canna, cyperus and papyrus. Tuberous rooted begonias are better started in pots or laid on moss kept constantly moistened, in a dark place, until planted about the first of March.

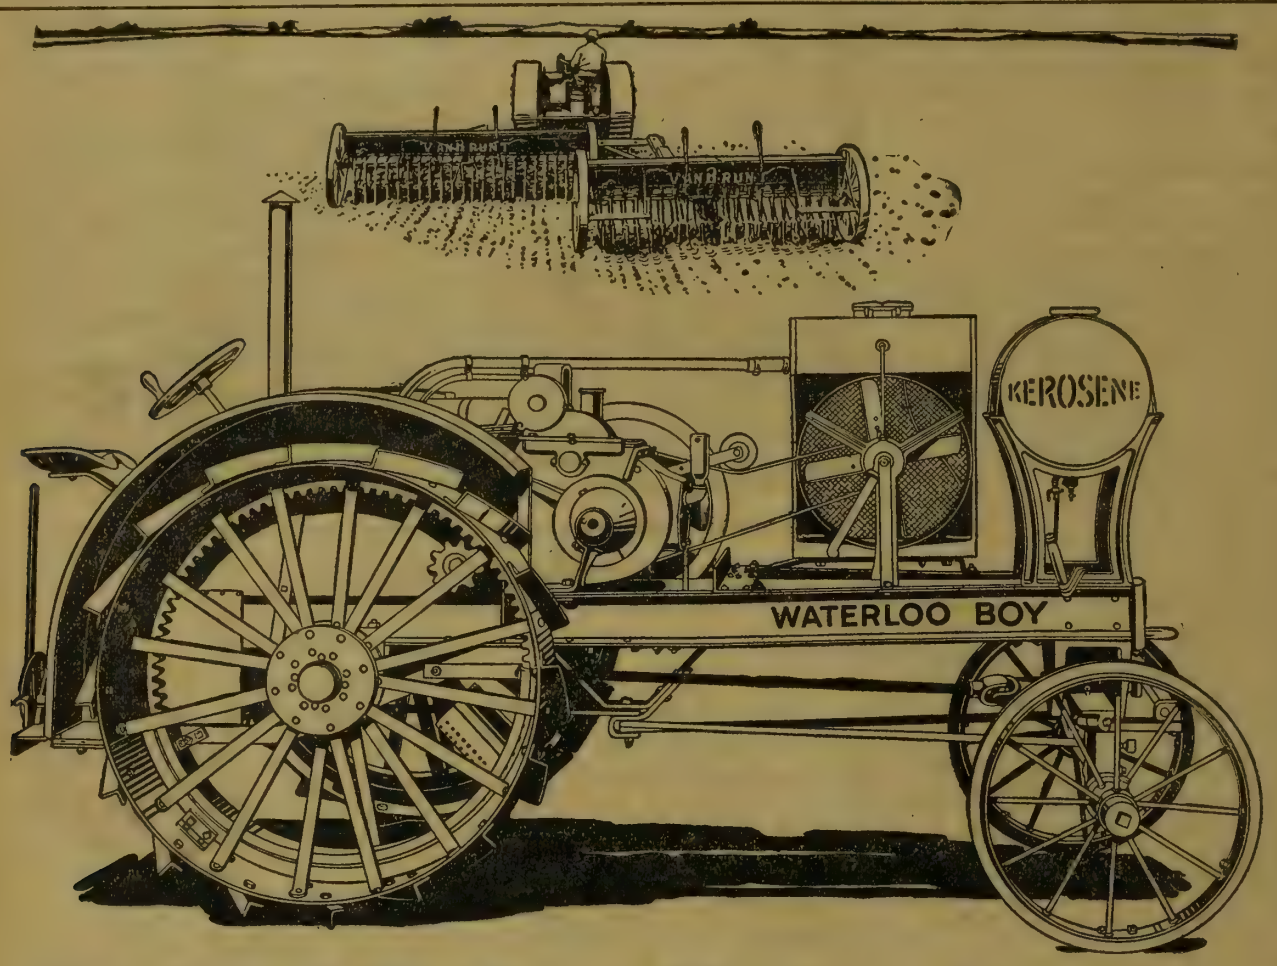
General Planting

Roses, bare root, balled, potted, or in other shape may now be put out; also light pruning of established bushes, but only to the extent of taking out weakly growths or mistletoe like heads. All deciduous trees and shrubs, including fruit trees and grape vines, do best in February plantings. Cypress, eucalyptus, Australian and South African trees and shrubs—all things of hardy type, including conifers or cone bearing trees, are better handled at this time, also palms if of good size, but small ones and tender species should be left for next month. The hardier dual purpose plants; feijoa or Paraguay guava, strawberry guava, sapote, are timely, but it is too early for subtropical stuff. There is no better time in all the year than the present for the fertilization of lawns.

Northern California

By A. R. Gould

THE time has arrived when we must make every preparation for a garden full of flowers, and after the very welcome rains we can look forward to a very successful season. It is very necessary that we put our gardens in order for planting. This means much trenching and manuring and if farmyard manure is used, well rotted material should be dug in. Bone meal and dried blood make excellent fertilizers. Lime should also be used where the ground is of a heavy nature. Lawns may be top dressed with dried blood and bone meal, also bulbs such as tulips, hyacinths and narcissus will be the better for any such assistance. Work it in the surface of the soil lightly and you will get larger flowers. Violets and lilies of the valley may be planted out this month in rich soil in some shady place. Roses



Only $5 for Repairs in Six Years of Service

THE makers of the Waterloo Boy Tractor do not consider it enough that their product is dependable and gives efficient service. They have built it into another feature which means much throughout the years of its profitable use. That feature is Waterloo Boy economy—not only in the use of fuel and oil, but for general up-keep and repairs.

WATERLOO BOY
KEROSENE TRACTOR

Back in 1914 Mr. E. F. Rowe, a farmer living near Hampton, Iowa, bought a Waterloo Boy Tractor. It was one of the earlier models put out by its builders. Its gears were not enclosed, its bearings were of the plain type—it lacked many of the improvements found on the present Waterloo Boy.

Mr. Rowe used his tractor for all his field operations and for most of his belt work. In checking up his expense last fall, he found that he had spent but approximately $5 for repairs during his six years of ownership. **Only $5 for repairs during six years of dependable, efficient, service.** And it is still going strong.

This is but one instance of Waterloo Boy economy. There are many, many others. Improvements on the present Waterloo Boy make it a great deal more economical than the one Mr. Rowe owns. The gears are now enclosed and run in oil, Hyatt roller bearings at all important points reduce friction and add to its long life. Every feature of construction makes for economical up-keep and operation.

Find out what a Waterloo Boy Tractor will do for you on your farm. Try it out. Your John Deere dealer will be glad to co-operate.

The Waterloo Boy Tractor and the John Deere No. 5 Tractor Plow make a reliable plowing outfit.

Write for a folder describing the Waterloo Boy fully. Also ask for Better Farm Implements, a 114-page book illustrating and describing the John Deere full line of farm tools. It's free. Address John Deere, Moline, Illinois, and ask for Package WB 76.

Save Money—Buy Pipe From Us

Farmers, Miners, Builders — people in every kind of business are saving money buying used or renewed pipe from us. We sell every kind of pipe. Send in a list of your requirements today and get our prices. We have saved hundreds of people 33 1-3 to 50 per cent on their pipe bills. Here's a partial list of some of the miles of pipe we have in stock for immediate delivery.

8,000 ft. 6 inch Riveted 16 Gauge
700 ft. 8 inch Riveted 16 Gauge
5,000 ft. 12 inch Riveted 12 Gauge
1,000 ft. 18 inch Riveted 12 Gauge
800 ft. 22 inch Riveted 14 Gauge
300 ft. 24 inch Riveted 14 Gauge
500 ft. 36 inch Riveted 12 Gauge
10,000 ft. light wrought iron 8 inch pipe with cast iron collars.

All above pipe thoroughly overhauled and inspected and ready for immediate use.

We also have large quantity standard pipe and screw casing, pressure tested and guaranteed.

Don't delay—write for our prices on your pipe requirements today.

When writing advertisers, mention the Cultivator.

should be pruned if this work has not been completed already.

Crysanthemums

Cuttings of these should be secured and inserted in sandy soil. Clumps may also be subdivided and replanted.

Annuals for a Bright Display

To obtain a quick showing there is nothing to equal the annuals, and you should lose no time in sowing seed in beds of well prepared soil of the following. Instructions will be given later for their care: Petunia, dwarf marigold, nemesia, calliopsis, ageratum, Godetia Schamini, Clarkia, zinnia, nigella, African marigold, phlox, dianthus, salpiglossis, schizanthus, linaria, linum, scabiosa, verbena, Nice stocks, lobelia and centaurea. This selection will keep your garden gay all summer.

Arbutus Unedo, "Strawberry Tree"

This very interesting tree, native to South Europe, has pretty white bell shaped flowers and red fruits somewhat like the strawberry, hence the popular name. It grows at least ten feet high and is very attractive. It should be more extensively planted. Order this now from your nurseryman and get it in your collection this season.

The Cutleaved Birch

There is nothing more beautiful than these trees with their graceful stems and silvery bark, especially the weeping type. This tree as a specimen on the lawn is ideal and a group of upright type of three or five with a planting of bulbs underneath, such as daffodils, will form a real picture for any garden.

Flowering Shrubs

These, carefully selected with a view to succession of flower, are essential features of the well planned garden. The following will give the desired effect: Berberis Darwinii, a beautiful shrub with yellow flowers of a drooping habit followed by bluish berries; Genista monosperma pendula, a very handsome white flowering shrub of a drooping nature; Chorizema ilicifolium, a charming shrub with orange colored pea shaped flowers in bloom early in the spring; Genista andreanus, with yellow and brown flowers, a free flowering shrub; Duranta plumieri, a very pretty shrub with pale blue flowers followed by bright yellow berries; Diosma ericoides, white flowering, covered with very small flowers and having fragrant foliage; cistus maculatus, of low spreading habit, white flowers with crimson spot; and Daphne, a favorite shrub, having white or pink flowers, very fragrant.

Conifers Worth Growing

Cupressus funebris, weeping type, very graceful; Cupressus glauca, blue cypress (both of these make fine specimens for the garden); Cryptomeria elegans, with fine feathery foliage. Thuya orientalis aurea, the golden arbor vitae, which will provide a charming color effect, planted in groups of three. Among the larger types we always include such trees as Cedrus deodara, C. atlantica glauca, Abies pinsapo, Sequoia sempervirens, S. gigantea, Pinus Coulterii, P. canariensis, P. ensignis and Sciadopytis verticillata, all of which are well worthy of a place in every garden of any size.

Useful Berried Shrubs

Crataegus yunnanensis, a recent introduction from China, Crateagus pyracantha, C. crenulata, Cotoneaster panosa, C. Francheti and C. microphylla, all have red or orange colored berries and should be planted in groups of three or six plants to secure the desired effect, and a bright display of berries when flowers are scarce. They thrive in any good garden soil. C. microphylla is useful for planting among the rocks or on sloping ground.

An appropriation of $250,000 will be asked by Assemblyman Chester M. Kline of Riverside County for the purchase of additional land, installation of water and construction of buildings for the proposed farm school to be located at Riverside.

$5000 SPRAYER

W. P. Clark, of Clark Monitor Orcharus, Wenatchee, Wash., says: $5000.00 could not buy my 'Friend' Sprayer if I could not get another."

Like all "Friend" users, he says a lot of other good things, too.

Of Course There is a Reason

Write to us stating the size of your orchard or grove and let us tell you more about these

True "Friend" Sprayers

The only low built, short turn, cut under, large wheel Sprayer made. Manufactured in four popular sizes.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Para-dichlorobenzine

A Cultivator subscriber, who is a druggist at Fairfax, writes regarding para-dichlorobenzine in effect that it has become quite an article of commerce and is known as what is called an intermediate in aniline manufacture. He says that it is quoted in New York in large quantities at 15 to 20 cents per pound, but is unable to inform us whether it is handled on the Coast.

Bitter Cream and Milk

Can you tell me why my cream turns bitter? I have a young cow who gives sweet milk, but the cream in two or three days gets a decided bitter taste. Cow is apparently healthy, feels well, eats well, looks well. She is fed good alfalfa hay, grain hay and mixed dairy feed. Cream does not sour.—Subscriber, Lancaster.

We refer the subscriber to an article written for the Cultivator by E. H. Hageman and used in the issue of May 1, 1920. It thoroughly discusses this matter of bitter flavor, which may be readily prevented by care in keeping out bacterial cultures, observation of cow's feed, condition of udder and possibly the advanced stage of the lactation period. On another page of this number we reprint "Causes for Bitter Flavor in Milk," written for the Cultivator of November 16, 1918, by S. L. Denning.

Planting Grapes and Figs

What is the right way to plant Thompson seedless grapes? Should they be planted to stretch wires east and west in order to get good results, or will they do just as well if wires are stretched north and south? I intend to plant ten acres Thompsons, five Malagas, five Muscats, and all around the land fig trees. Please advise how to plant and what are the best kinds of grapes and figs.—Subscriber, Fresno.

The usual way of planting Thompson Seedless grapes is to run the rows east and west. However, if it is easier to handle the vineyard with the rows north and south the difference in the growth and bearing, if any, will be very slight. On some vineyards the land will irrigate better and easier north and south, and in this case by all means run the rows that way. You may find a slight difference in the time it takes to dry the fruit, but even this point is in dispute among growers. As to the best varieties of grapes and figs to plant, you can probably make as good a guess as we can in this regard. A guess is the best we could do, and our guess is that your selections are good so far as the grapes go. As to the figs probably the White Adriatic will serve your purpose as well as any for a border tree.—F. K. H.

Seedling Walnuts

Would it be advisable to plant English walnut trees that come up from the seed? The mother tree was a seedling and a neighbor of mine has offered me about 25 of these young trees from one to three years old. Would I receive any benefit from these trees after they come in bearing?—Subscriber, Sacramento.

The probabilities are that these trees would hardly be worth planting. No commercial grower of walnuts is planting seedlings. They may or they may not be of value, so the grafted trees have entirely taken their place, and the grafted tree is usually on the native California Black stock. They are much hardier and give thriftier trees.

Nectarines

What is best variety of nectarines to plant in Sacramento section?—Subscriber, Sacramento.

The three commercial varieties usually planted in this state are Advance, Stanwick and Victoria. The first is a large green blotched with red, while the Stanwick has a pale skin, shaded slightly with violet. The Victoria is perhaps the more attractive marketing fruit, carrying a crimson color on the sunny side. The Advance ripens in July; the other two in August.

Pear Blight

I have just read in this week's issue of the Cultivator an inquiry about pear blight and your answer is, "No cure." I have had some experience that may help save the pear tree. It saved mine. I set out in my yard two Bartlett pear trees. They are five years old. The first year both trees made a fine growth with no blight. My neighbor's pear trees (large ones) suffered severely from blight. A friend called one day and the question of pear blight came up. He told me if I wanted to protect my trees from blight I could do it by burying some old iron around the tree. I had little faith in it but concluded I would try it on one tree. I dug in about two or three inches deep a half dozen pieces of old stovepipe. The second year this tree grew well and had no blight, while the one I put no iron under blighted so badly that I had to cut practically the whole top off. After I cut the top off I got a dozen old horseshoes and dug them in around this tree. The third year it grew a fine top and no blight. This last year neither tree had any blight and the one that lost its top three years ago had a heavy crop of the finest pears that grow. Feed your pear trees a little old iron and you may be surprised. Try it, and next fall report.—M. A. Packer, Riverside.

Sunburned Trees

I have some peach trees which are sunburned. Is there any remedy for it, or what could be done to help the trees out?—Subscriber, Turlock.

There is no remedy for the portion of the tree which has been burned other than to so treat it that borers and fungous disease will not secure entrance. The tree can be coated with Bordeaux or other fungicide and then all covered with whitewash which will prevent further burning. A simply made whitewash is: Quicklime, 5 pounds, salt ½ pound, sulphur ¼ pound. Slake lime slowly and add salt and sulphur while boiling. Finally add sufficient water to make consistency of cream.

Moving Olive Trees

I have some olive trees planted in a low piece of ground where the frost is so heavy that the trees have not grown well and the fruit is always injured before it is ripe enough to pick. I want to remove these trees but do not know the best way to do a good job of it. Any information you can give or get for me will be appreciated. —Inquirer.

We have seen olive trees 15 or 20 years old moved and ultimately make fine, thrifty trees in their new location. It calls for severe cutting back of the top, then, if possible to have derrick for the moving, take up with them sufficient ball earth that the nearby roots are preserved entire. Ability to do this depends upon nature of soil. Gravelly soil with many boulders makes it almost impossible. In any case, have hole sufficiently large ready before lifting the tree from its old location. As soon as placed in the new hole, preferably with same side to the south as in its original location, fill hole with dirt and water. Use sufficient water that the tree is settled into its new location without delay.

Liver Trouble in Rabbits

I have some small rabbits about three months old which have spotted livers. Do you think there is any harm in eating the rabbits if I throw away the liver?—Subscriber, Atwater.

As to spotted liver Townsend's "Practical Rabbit Keeping" suggests more green feed and more exercise but adds "Should the liver become diseased or chronic inflammation set in the rabbit had better be destroyed." "The Rabbit Book" by F. L. Washburn

When writing advertisers, mention the Cultivator.

suggests perfect cleanliness of hutches and runs, a few drops of tincture of iron in drinking water, variety of green feed, plenty of exercise and fresh air with perfectly dry nest box. Prevention, however, is better than doctoring. Animals seriously infected should not be eaten and in case where stock dies it should be burned or buried very deeply with lime to prevent carrying infection to other animals.

Cows Fail to Breed

I wonder if you can tell me what is the matter with my cows and heifers this year, as I cannot get them with calf. At first thought it was the fault of the bull, but find out in talking with at least four of my neighbors that they are having the same trouble. They have their own bulls. The cows are in good shape and have free range to grass, bean straw, wheat and barley and are giving a good quantity of milk. Have never had any trouble with them before. Have a good stock book but can find nothing in it that seems to answer my case. One of our neighbors thinks it is contagious abortion but I can't see that it is from the description in the stock book. The cows come in heat at regular times but do not catch. One heifer has been bred over six different times and one cow that has never had to be bred more than once has been bred three different times. Hope very much that you can tell me what is the matter with the cows and if there is anything I can do for them.—Subscriber, Oceanside.

Questions very similar to this have been answered in former Cultivators, and never with entire satisfaction, for there are so many different conditions which may cause the trouble, but we quote from one answer given by Dr. Petrie to almost identically the same question as above:

"Cows that are nice and fat and get little exercise are apt to do just as yours are doing. Drive them several miles until they get well warmed up. Repeat this once a week until they come in heat and again just before breeding. Also give these powders; they may help some. Six ounces of powdered gentian, three ounces of powdered nux vomica, three ounces of the sulphate of iron and four ounces of good corn meal. Mix and divide into 20 powders and give one powder every day in a little feed. If they refuse to eat the feed with the medicine in it then put a powder in a bottle, add a cup of water, shake it up and give it as a drench."

A portion of Dr. Petrie's answer given in another issue is also quoted here:

"When cows first get tuberculosis they sometimes get fat and fail to breed, but because they are fat and fail to breed is no sign that they have tuberculosis. Do not breed for two or three months. Reduce flesh by feeding sparingly and put a teaspoon of sulphate of iron in the feed of each cow once a day for three weeks. Then when they come in heat drive them about ten miles to get well warmed up and after resting for an hour breed. This will often get the desired results. Also have them tested for tuberculosis."

Pruning Shade Trees

I have noticed in cities and along avenues that they sometimes prune Oriental planes and other trees as they do some plum trees, thinned out and cut back. Why?—Millard Sharpe.

Mr. Sharpe has asked a very pertinent question. However, it is one we can not answer. The pruning of shade trees is more liable to represent the slaughter of the innocents than any real horticultural procedure. The reason for the cutting is unexplainable. Too many growers of shade trees have an idea that pruning is essential and so something has to be cut off. Trees along a sidewalk must be pruned in order to save bonnets and temper, but even there a great saving of the real beauty of the trees could be secured by narrowing the paved and traversed portion of the street and making much wider parking, and then letting the trees branch out from the ground until large husky trunks are secured.

How a $42,500,000 Company Upheld a 65-Year Reputation

FROM the very first, Allis-Chalmers recognized that the severe strains of farm duty require more than just a "power plant on wheels." And so this company—for over a half century builder of only high-grade machinery—set its vast resources and one of the world's foremost engineering staffs at work to build a super-tractor. That was seven years ago.

The Tractor That Took Seven Years to Build

Carefully—and under the supervision of engineers who have built the machinery for some of the largest factories in the world—the first Allis-Chalmers tractor was designed. But Allis-Chalmers was not satisfied.

In quantities of only five at a time, tractors were produced for testing in the field. Performance was watched—a careful check-up made on costs. Points of weakness were made points of strength. But still production was delayed!

Finally a limited number of Allis-Chalmers 18-30's were released. Would they stand the punishments of service? Would they uphold the quality traditions of this 65-year-old company? This was the final test—and the verdict of the farmer was awaited.

That seven years of engineering effort and the expenditure of $3,000,000 were justified is best proved by the fact that not a single A-C 18-30 owner made complaint.

Today, Allis-Chalmers tractors are perfected — this $42,500,000 company has reached the point for which it has striven for seven years. Now, with one of the largest manufacturing organizations in the world, Allis-Chalmers goes into volume production.

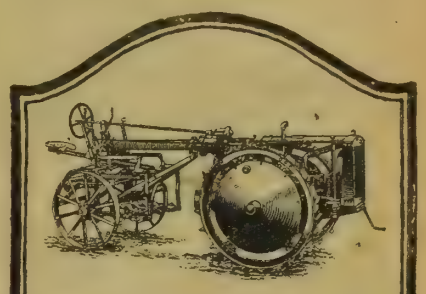
Long Life "Built In"—Surplus Power Guaranteed

EVERY construction unit of the 18-30 reflects Allis-Chalmers ideals. Frameless construction and flexible three-point suspension relieve the 18-30 of all strains, even in the roughest going; air entering the carburetor is first washed—freed of every particle of dirt and dust; an oversize fin-and-tube type radiator prevents overheating, even in warmest weather.

Then, too, the abundant reserve power of the 18-30 is always ready for emergencies. Under ordinary soil conditions this tractor pulls four 14-inch bottoms—without strain. It easily handles a 28-inch separator, with all attachments. The special governor, (Allis-Chalmers' own make), automatically holds the engine at a constant speed—varying the mixture according to the load.

Write for Booklet Today: Ask for the 18-30 or the 12-20 booklet—or both—giving exclusive features of Allis-Chalmers construction.

The Allis-Chalmers Mfg. Co.
Dept. 25C, Milwaukee, Wis.



A-C 6-12 Orchard Tractor

FOR orchard work, where space is at a premium, here is just the tractor the fruit grower wants. This Allis-Chalmers 6-12 delivers a constant drawbar pull of 1,000 pounds. Tractor wheels are the guide wheels—wheels of implement form rear sustaining member. Both tractor and implement are under one-man control. For belt work, too, the 6-12 is unusually adaptable. "Line-up" to machine to be driven is a simple, easy operation.

Dealers: The completion of the new Allis-Chalmers tractor foundry provides a production capacity of 100 tractors a day. A mammoth sales co-operation program in keeping with this large production is extended all Allis-Chalmers dealers. Write today for details of attractive dealership and jobber proposition.

McGUFFEY'S ECLECTIC FIFTH READER

Schoolboys and girls of other days, say of half or two-thirds of a century ago, may recall McGuffey's Eclectic Pictorial Primer, and so on up to his Eclectic Fifth Reader and Rhetorical Guide, "A Rhetorical Reading Book for the Highest Classes." As running mates may be recalled Ray's Arithmetic, Parts I, II, and III, which were the third of the great trio, the three R's.

Memories of the old log schoolhouse came back the other day and I wrote to Sister, back at the old homestead, and asked as to some of the old school books, and by return mail there came a copy of tattered old McGuffey's Fifth Reader. This was the old edition of 1853, the one which was printed long before the Sixth Reader came into being, and printed, in fact, many years before my school days. The old book bears the marks of age and of hard usage. Part First is devoted to the principles of elocution and touches upon articulation, inflection, accent, gesture—but why refer to it at all, for it will come back quickly to school-boys and girls of those days who happen to notice the poem or the selection filling the place of the story on this page this week. Some of the elder subscribers of the Cultivator have requested the reprinting of some of these old school book stories. We hope the first installment will renew memories of other days.—M.

LORD ULLIN'S DAUGHTER

A chieftain to the Highlands bound
Cries, "Boatman, do not tarry!
And I'll give thee a silver pound
To row us o'er the ferry."

"Now, who be ye would cross Loch Gyle
This dark and stormy water?"
"Oh, I'm the chief of Ulva's isle,
And this, Lord Ullin's daughter."

"And fast before her father's men
Three days we've fled together,
For should he find us in the glen
My blood would stain the heather.

"His horsemen hard behind us ride;
Should they our steps discover,
Then who will cheer my bonny bride
When they have slain her lover?"

Out spake the hardy Highland wight,
"I'll go, my chief, I'm ready:
It is not for your silver bright,
But for your winsome lady.

"And, by my word; the bonny bird
In danger shall not tarry;
So, though the waves are raging white,
I'll row you o'er the ferry."

By this, the storm grew loud apace,
The water wraith was shrieking;
And in the scowl of heaven each face
Grew dark as they were speaking.

But still, as wilder grew the wind
And as the night grew drearer,
Adown the glen rode armed men,
Their trampling sounded nearer.

"O haste thee, haste!" the lady cries,
"Though tempests round us gather;
I'll meet the raging of the skies,
But not an angry father."

The boat has left the stormy land,
A stormy sea before her,
When oh! too strong for human hand,
The tempest gathered o'er her.

And still they rowed, amid the roar
Of waters fast prevailing;
Lord Ullin reached that fatal shore,
His wrath was changed to wailing.

For sore dismayed, through storm and shade
His child he did discover;
One lovely hand she stretched for aid,
And one was round her lover.

"Come back! come back!" he cried in grief,
"Across this stormy water;
And I'll forgive your Highland chief,
My daughter! oh, my daughter!

'Twas vain: the loud waves lashed the shore,
Return or aid preventing.
The waters wild went o'er his child,
And he was left lamenting.

—Campbell.

THE TOURNAMENT

By Walter Scott

THE music of the challengers breathed from time to time in wild bursts, expressive of triumph or defiance, while the clowns grudged a holiday which seemed to pass away in inactivity; and old knights and nobles lamented the decay of martial spirit and spoke of the triumphs of their younger days. Prince John began to talk to his attendants about making ready the banquet and the necessity of adjudging the prize to Brian de Bois-Guilbert, who had with a single spear overthrown two knights and foiled a third.

At length, as the music of the challengers concluded one of those long and high flourishes with which they had broken the silence of the lists, it was answered by a solitary trumpet, which breathed a note of defiance from the northern extremity. All eyes were turned to see the new champion which these sounds announced, and no sooner were the barriers opened than he paced into the lists.

As far as could be judged of a man sheathed in armor, the new adventurer did not greatly exceed the middle size, and seemed to be rather slender than strongly made. His suit of armor was formed of steel, richly inlaid with gold, and the device on his shield was a young oak tree pulled up by the roots, with the single word "Disinherited." He was mounted on a gallant black horse, and as he passed through the lists he gracefully saluted the prince and the ladies by lowering his lance. The dexterity with which he managed his steed and something of youthful grace which he displayed in his manner, won him the favor of the multitude, which some of the lower classes expressed by calling out, "Touch Ralph de Vipont's

WHAT you lose thru baking failure must be added to baking costs—it has to be paid for.

Calumet Baking Powder will save you all of that. Because when you use it—there are no failures—no losses. Every baking is sweet and palatable—and stays moist, tender and delicious to the last tasty bite.

That's a big saving—but that isn't all. You save when you buy Calumet and you save when you use it.

Pure in the can - Pure in the baking

It is reasonable in cost and possesses more than the ordinary leavening strength. You pay less and use less. You get the most in purity, dependability and wholesomeness.

In every way — it is the best way to keep down baking costs. That's what has made it the world's biggest selling baking powder — has kept it the favorite of millions of housewives for more than thirty years.

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Sunshine Cake Recipe

½ cup of butter, 1½ cups granulated sugar, 2½ cups flour, 1 cup water, 2 level teaspoons Calumet Baking Powder, 1 teaspoon lemon, yolks of 9 eggs. Then mix in the regular way.

the life of the party

Say "Gear-ar-delly"

Whether it's a "little party" or a "big affair" Ghirardelli's is a great comfort to any hostess [big or little]. Cups of creamy, hot chocolate, chocolate layer cake, "fascinating" squares of chocolate fudge [not to mention a host of other goodies] —you can rely on Ghirardelli's to be the life of the party.

Ask for Ghirardelli's at the store where you trade; and write for our Book of Chocolate Recipes—it's free!

Every Kind of Wearing Apparel for All the Family

The "NATIONAL" Policy

Always to Please the Customer

Your Money Back if You Want It

READERS of "California Cultivator" here is a message of Lower Prices, of Better Styles and more Lasting Satisfaction than you have known before.

The "NATIONAL" Money-Saving Style Book pictured here, offers you complete the best New York Styles for Spring in everything for women's, men's and children's wear and at **lowest prices.**

To have this book in your home is to have a price standard, a standard of values. To study it is to know the new styles and the new prices—the lowest prices for Spring.

Economize on Your Spring Clothes

Economize by getting better quality, "NATIONAL" time-tried quality—at lowest prices. Prices are now down to the level that they were some years ago and the quality of "NATIONAL" goods is pre-war quality always.

Our New Kansas City Home

WE have erected a new two-million dollar 12-story home for the "NATIONAL" in Kansas City to serve our customers living in the fifteen States listed below.

This big new building is filled with the same New York styles, the same goods exactly, offered at the same prices exactly, as our New York House.

The only difference is that Kansas City is 1,350 miles nearer to you who live in these States. Your letter travels 1,350 miles less and your order travels 1,350 miles less than it formerly did when you ordered from New York.

So if you live in one of the States listed below, write to our Kansas City house for your copy of the "NATIONAL" Style Book. It is exactly the same as the New York Book, the same goods, the same prices—the same styles and qualities.

If you live in one of these States, write to Kansas City, Missouri.

shield, touch the Hospitaller's shield; he has the least sure seat; he is your cheapest bargain."

The champion, moving onward amid the well meant hints, ascended the platform by the sloping alley which led to it from the lists, and, to the astonishment of all present, riding straight up to the central pavilion, struck with the sharp end of his spear the shield of Brian de Bois-Guilbert until it rang again. All stood astonished at his presumption, but none more so than the redoubted knight whom he had thus defied to mortal combat, and who, little expecting so rude a challenge, was standing carelessly at the door of his pavilion.

"Have you confessed yourself, brother?" said the Templar, Guilbert, "and have you heard mass this morning, that you peril your life so frankly?" "I am fitter to meet death than thou art," answered the Disinherited Knight, for by this name the stranger had recorded himself in the book of the tourney. "Then take your place in the lists," said De Bois-Guilbert, "and look your last upon the sun, for this night thou shalt sleep in paradise." "Gramercy for thy courtesy," replied the Disinherited Knight, "and to requite it, I advise thee to take a fresh horse and a new lance, for, by my honor, you will need both."

Having expressed himself thus confidently, he reined his horse backward down the slope which he had ascended, and compelled him in the same manner to move backward through the lists till he reached the northern extremity, where he remained stationary in expectation of his antagonist. This feat of horsemanship again attracted the applause of the multitude.

However incensed at his adversary for the precaution which he recommended, the Templar did not neglect his advice, for his honor was too nearly concerned to permit his neglecting any means which might insure victory over his presumptuous opponent. He changed his horse for a proved and fresh one of great strength and spirit. He chose a new and tough spear, lest the wood of the former might have been strained in the previous encounters he had sustained. Lastly, he laid aside his shield, which had received some little damage, and received another from his squires.

When the two champions stood opposed to each other at the two extremities of the lists, the public expectation was strained to the highest pitch. Few augured the possibility that the encounter could terminate well for the Disinherited Knight, yet his courage and gallantry secured the general good wishes of the spectators. The trumpets had no sooner given the signal than the champions vanished from their posts with the speed of lightning and closed in the center of the lists with the shock of a thunderbolt. The lances burst into shivers up to the very grasp, and it seemed at the moment that both knights had fallen, for the shock had made each horse recoil backward upon its haunches. The address of the riders recovered their steeds by the use of the bridle and spur, and having glared at each other for an instant with eyes that seemed to flash fire through the bars of their visors, each retired to the extremity of the lists and received a fresh lance from the attendants.

A loud shout from the spectators, waving of scarfs and handkerchiefs and general acclamation attested the interest taken in the encounter. But no sooner had the knights resumed their stations than the clamor of applause was hushed into a silence so deep and so dead that it seemed the multitude were afraid to breathe. A few minutes' pause having been allowed that the combatants and their horses might recover breath, the trumpets again sounded the onset. The champions a second time sprang from their stations and met in the center of the lists with the same speed, the same dexterity, the same violence, but not the same equal fortune as before.

In the second encounter the Templar aimed at the center of his antagonist's shield and struck it so fairly and forcibly that his spear went to shivers and the Disinherited Knight reeled in his saddle. On the other hand, the champion had in the beginning of his career directed the point of his lance toward Bois-Guilbert's shield, but changing his aim almost in the moment of encounter, he addressed to the helmet, a mark more difficult to hit, but which, if attained, rendered the shock more irresistible. Fair and true he hit the Templar on the visor, where his lance's point kept hold of the bars. Yet even at this disadvantage Bois-Guilbert sustained his high reputation, and had not the girths of his saddle burst he might not have been unhorsed. As it chanced, however, saddle, horse and man rolled on the ground under a cloud of dust.

To extricate himself from the stirrups and fallen steed was to the Templar scarce the work of a moment, and stung with madness, both at his disgrace and the acclamations by which it was hailed by the spectators, he drew his sword and waved it in defiance of his conqueror. The Disinherited Knight sprang from his steed and also unsheathed his sword. The marshals of the field, however, spurred their horses between them and reminded them that the laws of that tournament did not on the present occasion permit this species of encounter, but that to the "Disinherited Knight" the meed of victory was fairly and honorably awarded.—Walter Scott.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Three Owners

Three persons purchased 150 acres of unsurveyed land. One chose the 50 acres he desired, started in plowing and sowed barley at various spots throughout the 150 acres. Another did considerable work throughout the land. The land is to be divided into three equal parts of 50 acres each. How can it be divided and to whom belong the crops?—Subscriber, Glenn.

The solution of that problem depends very largely upon the contract of purchase. If the three parties bought the land with the view of purchasing in common and with the subsequent idea of dividing among them, they were tenants in common of the land. Each one had the right of possession of all the land. In that respect it would be in the nature of partners, and the profits, less the expenses, would be divided up among the three. On the other hand, the rule would prevail that where a person voluntarily enters upon someone else's land and makes improvements there, those improvements belong to the owner of the land and he would have his work for nothing. The case depends so much upon the exact agreement between the parties that no more definite answer could be given.

Will Made in Canada

Several years ago I drew up a will in Canada. I have since moved to California. Is this will good in case of death? Does a will do away with any court proceeding? — Subscriber, Exeter.

If the will is executed and acknowledged in accordance with the laws of the state of California it matters not where it was originally drawn. In order to be a valid will in respect to transfer of real property it must be valid according to the laws where that real property is situated. In order to be valid in respect to the passage of personal property a will must be valid according to the laws of the domicile of the testator at the time of death. A will does not do away with the necessity of administration of the estate, but the will must be probated, and the court thereafter decrees that the property be distributed in accordance with the terms of the will.

Horses on Highway

Two horses were in pasture next to public road. They knocked the fence down, strayed into the road where they were struck by an automobile and were so injured that it was necessary to kill them. The automobile was also damaged. Who can collect damages?—Subscriber, Escondido.

The motor vehicle act provides that no person owning or controlling the possession of any horse or other livestock shall voluntarily or negligently permit such animal to stray upon or remain unaccompanied by a herder or other person in charge or control thereof upon a public highway either side of which is bounded by property which is separated by such highway, by a fence, sidewalk or building, or shall permit any portion of the tether to which the animal is attached to lie across or on the highway, and no person shall allow such animals to pass upon a highway between sunset or sunrise without herders on duty, so as to keep the road open and also to keep red lanterns burning. As to the owner of the horses, it will, therefore, be a question as to whether the breaking of the fence or failure to repair the fence was negligent. As to the liability of the owner of the automobile, that would be a question of whether he was negligent in failing to see or taking pains to avoid the animals.

Manure on Leased Land

I leased an alfalfa ranch for a year. The ranch was sold to a third party during the lease. Can the third party hold the manure made by livestock during the year providing nothing is said in lease on this subject?—Subscriber, Hughson.

It is the general rule that manure made by a tenant upon a leased farm is, in the absence of special agreement to the contrary, the property of the lessor and belongs to the farm as an incident necessary for its improvement and cultivation; and a tenant has no right to remove it from the premises or place it to any other use.

Lighting Company Trespassing

Some years ago an electric lighting company during my absence placed its poles and ran its wires across my property without my consent. Afterwards I placed an objection at their office. Would they acquire permanent right of way? What steps should be taken to avoid the acquisition of such right?—Subscriber, Santa Ana.

A permanent right of way may undoubtedly be acquired if the pole line is permitted to remain upon the property for a long period of time with the knowledge and acquiescence of the owner of the property. If the poles and wires were recently placed thereon, you could undoubtedly tear them down and remove them as in the case of any other trespass, but now your safest way to do would be to bring an action in trespass against the company.

School Attendance Compulsory

Does the law require a boy 15 years of age, graduated from the grammar school, to go to high school?—Subscriber, San Jacinto.

Under the act to enforce the educational rights of children it is provided that each parent having the control or charge of any child between the ages of eight and 16 years shall be required to send such child to a public ful time day school for the full time for which the public schools of the district in which the child resides shall be in session. There are a number of exemptions therefrom, such as physical and mental disability, residence of more than two miles' distance from schoolhouse, children receiving instruction from private schools or from private tutors, and those who hold a high school certificate. Where children are not exempted, the parent or the one having control of the child may be subject to fine of not less than $50 nor more than $200 or imprisonment in the county jail for not exceeding 60 days. Those persons exempted must have issued to them a certificate for their exemption, generally by the county superintendent of schools. The details of the exemptions are quite extensive.

STATE DAIRY COW COMPETITION

HE new dairy cow competition held under the supervison of Prof. F. W. Woll of the college of agriculture, University of California, is getting a good headway. The records for December, which are just out, show the remarkable average production of 1,412 pounds of milk and 55.25 pounds of butter for the 144 cows in milk during the month. Southern California cows are more numerous than in former contests and are showing up excellently.

	Name	Breed	Age	Lbs. Milk	Pct.	Lbs. Butterfat
1.	Ventura	Gr. H.	5	1,975	5.00	98.65
2.	Marken Louise	H.	5	3,068	3.21	98.47

20.	786	Gr. H.	....	2,984	3.45	71.90

The reports for December so far received show that 144 cows in milk during the whole month produced an average of 1,412 pounds of milk and 55.25 pounds of butter fat, equivalent to about 65 pounds of commercial butter. The total production of these 144 cows amounted to nearly 8,000 pounds butterfat, worth at the present low price of butter over $4.600, or an average return of about $32.50 per cow for the butterfat only for the month. The list includes pure breds of the main dairy breeds and a large proportion of grades, all of which have the characteristic of being high producing cows.

The largest production of butterfat for the month was made by the grade cow Ventura, owned by Los Angeles County Farm, viz., 1,973.9 pounds milk and 98.65 pounds butterfat (average per cent, 5), her production being slightly higher than that of the pure bred Holstein, Marken Louise, owned by Anita M. Baldwin, Santa Anita (3,068 pounds milk, 98.47 pounds butterfat, average test 3.21 per cent). It would more than treble the returns from our dairies and be worth at least $100,000,000 annually to the state if, through some miracle, all the dairy cows of the state could be made to yield a similar production as these two cows.

The 20 highest record cows for the month of December:

Owners of cows: 1, 10, 16, 17, Los Angeles Country Farm, Hondo; 2, 7, 8, 11, 13, 19, Anita M. Baldwin, Santa Anita; 3, 6, 9, 14, Earl Graham, Compton; 4, Edwards Bros., Ripon; 5, 20, Napa State Hospital, Napa; 12, 15, Burr Farm, Los Angeles; 18, H. G. Gross, Eureka.

The California Cultivator prize for December was won by Earl Graham of Compton, for an average production of 75.96 pounds of butterfat by five grades. Other groups of grades eligible for this prize produced on the average as follows: Grades owned by Napa State Hospital, 71.47 pounds; F. F. Pellissier, 63.17 pounds; C. E. Fisher, 46.01 pounds; J. M. Christen, 47.91 pounds.

Cows may still be entered in the state dairy cow competition, entries closing next April 1. Information concerning the competition, rules, prizes offered, etc., as well as entry blanks, will be furnished upon application to F. W. Woll, Superintendent of Dairy Tests, University Farm, Davis.

MARIN COUNTY DAIRYMEN AWAKE

At the recent Petaluma calf club sale Marin County dairymen took home ten of the 18 pure breds offered. They did such live bidding that Sonoma County dairymen could not keep the pace. Amongst the buyers were A. J. Gambonini of Marshall, who bought Valdessa Fayne Pontiac for $700, the topper of the sale; M. T. Freitas, San Rafael, Sir Veeman Korndyke Duchess Lad and King Paul Marmion; U. Garsoli, Bolinas, King Pearl Inka; O. L. Shafter Estate, Inverness, Sir Skylark Wayne; C. McConnell, Inverness, Winsome Veeman, whose dam has made 503.56 pounds butter in 222 days of this year's test; Thos. B. Roy and son, Ralph Roy, San Geronimo, Sunshine Farm Laddie; J. H. Rogers, Nicasio, Beauty's Laddie; F. Lonzi, Nicasio, Peggy of Elkhorn; F. R. Cummings, San Rafael, pure bred Ayrshire.

Of late years Marin County has dropped to sixth place as a dairying county in California, but it looks as if the tide had turned and it will not be long, at the rate she is coming back, before she will assume her old position near the lead. The county was active in the purchase of pure bred stock at the farm bureau bull sale held in Petaluma in September, but came back stronger than ever on Wednesday.

The county put in a farm adviser early last fall, Farm Adviser Boissevain, who acted as clerk at the sale.

CAREFUL BREEDING INCREASES PRODUCTION OF GOATS' MILK

Milk goat experiments in grading up from native and grade Toggenburg and Saanen does with pure bred Swiss bucks, begun in 1911, were continued last year by the United States department of agriculture at the government experiment farm at Beltsville, Maryland. The flock comprises 26 does and eight kids of one-half, three-fourths, seven-eighths and fifteen-sixteenths blood. The average daily milk yield per doe in 1919 was 3.92 pounds, an increase of 2.42 pounds over the

yield of the ten selected native does which formed the foundation stock of the herd. The highest milk yield for an individual doe in one day is 8.6 pounds. For 1919 the flock showed an average of 3.7 per cent butter fat.

THE HOPE OF LIVESTOCK BREEDERS

By Frank D. Tomson

Anyone who was in attendance at various fairs and livestock shows during the fall and early winter months could not fail to observe the increased numbers and improvement in standards of pure bred exhibits. This is a most encouraging fact when it is considered that such a large number were beginners in the show phase of the business.

The largest collection of Shorthorns ever displayed in the United States was exhibited at Chicago. The Shorthorn display at the Pacific International at Portland exceeded 325 head, a display that would have made a most creditable showing at the Chicago International without the addition of any others. All through the Intermountain and Coast states, through the corn belt and Eastern and Southern states there was a large increase in the Shorthorn exhibits and a decided improvement in the standards represented.

This is all in the line of progress and plays its useful part at this time when there is such an imperative need of better types, in order to insure to the ranchman, the farmer and the dairyman adequate returns. This matter of standards and types is a serious issue now. Every change that takes place in the business situation relating to production emphasizes the importance of the use of the kind of livestock that will produce the greatest amount of beef and yield the largest amount of milk at the least expense of feed, labor and maintenance. These extra pounds and quality which the pure bred standard provides embraces often all of the profit that gets back into the producer's bank account.

There is a cooperative effort embracing all breeds that is in the interests of the ordinary farmer and ranchman to a greater extent probably than he realizes, and it can be said to the credit of the farmers and ranchmen that they have come to recognize the practical value of the improved standards resulting from the use and concentration of pure breeding. Never have we known such a general, favorable inclination to employ the purebred sire and the pure bred female as the surest means for increasing the yields of beef and milk, mutton and pork, as exists at this time. The livestock producers in the range countries and all through the corn belt have sustained their share of the shrinkage in values, a shrinkage that is applying to every line of commercial activity. The industry will be sustained and strengthened by changing from the standards of the old days to the better standards that are provided by the more extensive use of pure breds. There is admittedly a great future for the producer, but his main reliance must be with the more responsive types which good breeding alone provides.

THE FLAVOR OF MUTTON AND LAMB

There is a characteristic taste in cooked mutton and lamb which distinguishes it from other kinds of meat. This flavor is produced by the chemical contents of the fat and probably by their changes during the process of cooking. It is quite common to hear the taste of lamb and mutton spoken of as the "woolly flavor." Many regard this to be due to the wool coming in contact with the flesh. Tests have been made to determine the exact cause of the flavor, but as yet no definite conclusions have been reached.

The following experiments have been conducted to show whether or not certain factors were responsible for the flavor:

The meat was brought in contact with wool; gas was permitted to generate in the intestines before the entrails were removed; the external layer of muscles was removed from portions of the carcass; at various intervals tests were conducted on different portions of the same carcass and carefully checked; comparisons were made of the meat of sheep and lambs of different ages and experiments were conducted with meat of the wool and mutton breeds with regard to texture and flavor. None of the above experiments demonstrated to any degree of certainty that the taste of mutton and lamb was due to unnatural causes.

INSECTS AND HOG CHOLERA

Work of the bureau of animal industry shows that both the house fly and stable fly are capable of carrying hog cholera for short periods under certain conditions, thus suggesting the desirability of securing more data on this subject, and especially to determine if some insect might be responsible for the appearance of cholera at various points sometimes far removed from known cases of the disease. Later experiments, conducted by the federal bureau of entomology, were carried out with the house fly, stable fly, and Simulium. The first two species gave positive transmissions in a number of instances, the results on the whole agreeing closely with those previously obtained by the bureau of animal industry.

THE BREEDING OF THE SOW

A properly fed gilt comes in heat at the age of seven to eight months and regularly thereafter every three weeks. The only deviation from this rule would be caused by sickness throwing the animal out of balance. A properly kept sow comes in heat as regularly as clockwork every three weeks. Once a sow or gilt has come in heat and been bred it is a very easy matter to tell when she will come in heat after farrowing. If she is bred on a Wednesday, she will always be ready to breed on a Wednesday or some multiple of a three week period. For example: A sow goes about 16 weeks (three months, 3 weeks, 3 days, or 112 to 116 days) between breeding and farrowing. If she then suckles the pigs six or seven weeks she will come in heat exactly 24 weeks after being bred and next time 27 weeks, and so on. If she has been allowed to run down while nursing the pigs she may not come in heat for a month or more after the pigs are weaned, but when she does come in heat it will be on a multiple of a three week period from the date she was bred last. All that is necessary is to mark down the date and day of week of breeding and then count up 24 or 27 weeks from that date, and if the sow has been properly fed and is not sick she can be taken to the boar. There is just one reliable way of telling whether a sow is in heat or not. Owing to the peculiar shape of the boar's genital organ a sow's genital parts have to swell up, and this swelling starts from three to four days before the sow is ready for the boar. While the swelling lasts for about seven days—coming three, going three and stationary one day in the middle—only on this day, that is to say, for about 24 to 36 hours, will she take the boar. The swelling is quite noticeable and the parts have to be large and soft, which they will be at the proper time. —J. G. French.

AUCTION

19---Registered Holsteins---19 40---Grade Holsteins---40

at the Rhoades & Rhoades Sales Pavilion at Hynes

Tuesday, February 15th, at 10 A.M.

On account of closing out his entire dairy herd, the owner, Mr. R. Zangl, will offer 19 head of choice Holstein females. Among them will be found daughters of such famous sires as

COLANTHA SIR AAGGIE
TOYON SEGIS FERNDALE
TIDY ABBEKERK PRINCE
FINDERNE SOLDENE VALDESSA
KING PONTIAC TOPSY
SIR ORMSBY HENGERVELD
STAR YOUTH KORNDYKE WAYNE
KING SEGIS DE KOL MEADE

A large number of these females have very creditable A. R. O. records in both the 7 day and yearly divisions. They are all large cows with plenty of capacity and are real producers from a standpoint of milk production.

A SON OF PRINCE GELSCHE WALKER out of a 20.86 lb. cow whose sire was out of Aralia De Kol and his dam out of Miss Blaney.

SENSATIONAL

King Paul Korndyke Vale will be sold. He is out of a 31.42 lb. cow whose sire, Sir Sadie Cornucopia, was from the first 30 lb. cow of the breed, Sadie Vale Concordia. The sire, King Korndyke Sadie Vale, has a 40 lb. daughter, a 40 lb. sister and a 41 lb. dam who in turn is out of Sadie Vale Concordia. This is one of the highest record sires in the West and will make some fortunate purchaser a mint of money. Come to the sale and buy him.

The grade cattle are an exceptionally good lot of producers, all being either just fresh or heavy springers.

The Greatest Duroc Boar of His Age! Choice Wonder 3d

Senior and grand champion boar of California. A consistent winner in the show ring, having been a winner as a junior pig at the Iowa state fair in 1919. He is siring a high class of young stuff and is being mated to a class of sows that will breed on.

Write for Prices. Satisfaction assured.

JUNE ACRES STOCK FARM **V. F. Dolcini, Davis, Cal.**

Attention Duroc Breeders

I am offering for sale Golden Cherry 264101, my two year old boar by Great Model and out of the great sow, Cherry Blossom. Here is a pioneer sire and real herd header. Also have a few young boars and gilts for sale. Prices reasonable.

C. E. BORDEN

P. O. Box 51 Oceanside, Cal.

THE C. C. ELLIS DUROC SALE

The initial sale of bred Duroc-Jersey sows held at Tulare, by C. C. Ellis of Exeter, on Saturday, January 29, hardly brought as high an average as most of those present expected. The offering was of high quality and was presented in prime condition.

The top sow, Waukeen Prospect, was bought by Johnny Glusing, Winton, and P. E. Mitchell at $235. Frank Guerin, Tulare, and P. Van De Pol, Ripon, were two of the heaviest buyers and bidders.

Fifty-six head sold for an average of $55 per head, a very good average considering the large number sold.

Col. Geo. Bell, Tulare, on the block and John Davis, Manteca, in the ring worked hard and got every dollar possible for the offering.

DETAILED PROGRAM OF STOCKMEN'S WEEK

At Davis, February 22-25 In Next Issue.

However, the farmers and pork raisers hardly seem to realize the opportunity they are overlooking in not taking advantage of the low price of grain and the solid pork market.

Thirty head were sold at an average price of $63 per head, a price low enough for any one to stock up with the assurance of making a profit out of the transaction. The top price was paid for No. 2, Arenal Blossom. She went to W. H. Ricker, Glendora, at $300. Lot 9, Cardinal's Model Queen, sold to the J. G. Jackson Estate, Sacramento, for $225. The balance brought nominal prices. J. P. Walker, Visalia, bought eight choice gilts at bargain prices. Wm. Snowden, Los Angeles; E. Wing, Three Rivers; Geo. Stobie, Farmersville, were all heavy buyers.

Col. Geo. W. Bell, Tulare, was in good form and did the selling in a high class manner.

DIAMOND BAR SALE

February 16 is going to be another big day in Duroc history in California for it is the date set for the Diamond Bar Ranch sale. Last year the Diamond Bar sale set a record for attendance and average price that will probably stand unbroken for a long time.

When Fred Lewis went into Durocs he did so because he was convinced they are the best hog for his conditions. Having chosen the best breed he spared no expense to found a herd that would be second to none in America.

Mr. Lewis equipped the Diamond Bar with buildings and mechanical appliances which allow a great number of hogs to be fed and cared for easily and cheaply. He insists that the pigs he culled very closely and only the few best individuals he sold as breeders. He maintains a show herd which has been very successful, because he believes that if his animals win it not only helps the Diamond Bar but also the breeders throughout the country who have Diamond Bar stock. He is advertising extensively in this country and in Mexico and South America in an attempt to draw trade to the Diamond Bar and to the other Duroc breeders of the state.

California is the logical leader in the livestock industry, and a concerted effort of the Duroc breeders will do wonders in bringing about the desired results. His motto is "Satisfied Customers."

The Diamond Bar must be seen to be appreciated. The big sale of bred sows and gilts is held on Wednesday, February 16. This will be a wonderful opportunity to visit this great breeding establishment and meet the man who planned the Diamond Bar Ranch in all its details, also see the uniformly good individuals being produced out of this wonderful foundation stock.

FALFADALE DISPERSAL SALE

Through conditions not the fault of anyone it has been deemed necessary to disperse the fine herd of Durocs at the Falfadale Ranch at Perris. This herd includes the great boar, Great Orion Sensation Junior, who was a winner in all the shows last fall. His

Great Orion Sensation Junior

get were also right up in the money at all times. He is the finest boar ever sold at auction in the West and the man who gets him will be lucky indeed. Practically all of the sows in the sale are safe in pig to this grand champion boar, and some wonderful litters should result. The sale will be under cover at the farm near Perris on Thursday, February 17. You should plan to attend.

THE LES McCRACKEN DISPERSAL SALE

The dispersal sale of Poland China sows by Les McCracken, Ripon, Monday, January 24, marked the closing out of one of the largest herds in the West. A large crowd was present, in fact the largest crowd of breeders that has attended any hog sale this winter. The grand champion boar, King's Big Bone Leader, one of the most remarkable boars of his age in the country, was bought by H. I. Marsh, Modesto, at $360.

A number of exceptionally good official records have recently been completed in the herd of registered Holsteins at Sycamore Acres, owned by Robt. N. Clapp, Nuevo. Rossmaines May Korndyke, a junior two year old daughter of King Pontiac Netherland Segis 3d and out of a daughter of Prince Gelsche Walker Korndyke, made 21.12 pounds butter in seven days and 80.78 pounds in 30 days. Rosamaines Pontiac Gold Drop, a senior two year old daughter of King Pontiac Netherland Segis 3d, and out of the noted producing and breeding cow Locust Terrace Gold Drop, made 24.31 pounds butter from 591.3 pounds milk in seven days and 96.38 pounds butter from 2,386.6 pounds milk in 30 days. Stanislaus Piebe Laura Pontiac, a granddaughter of King Pontiac Netherland Segis, made 32.82 pounds butter from 512.7 pounds milk in seven days as a senior four year old. Two other members of the herd made over 21 pounds butter each in seven days, and in the entire milking herd at Sycamore Acres there are only two females with records below 20 pounds and both of these will shortly freshen and be placed on test again

California Breeders

have sold more than $500,000 worth of registered cattle in our sales, under the most stringent requirements laid down by any sales organization in America. Satisfied buyers have been the rule in all our sales.

When Writing Advertisers Mention California Cultivator.

The first four daughters of Sir Aaggie De Kol Acme on long time test have recently completed excellent records in the herd of registered Holsteins owned by A. W. Morris & Sons Corporation, Woodland. These are all first calf two year olds, and the records given are for 305 days. Aaggie De Kol Pontiac Mead made 653.66 pounds butter from 17,053.5 pounds milk. Miss Aaggie De Kol Juliana made 622.19 pounds butter from 17,097.6 pounds milk; Miss Aaggie Grace Alcartra made 617.18 pounds butter from 16,663.1 pounds milk; and Ethel Pontiac Aaggie made 524.44 pounds butter from 13,409.4 pounds milk, making an average for the four of 604.26 pounds butter from 16,055.5 pounds milk in 305 days. These heifers, as well as the other daughters of Sir Aaggie De Kol Acme now coming on, some of which are on yearly test both in the Morris herd and in the Kiesel herd at Sacramento, are an exceedingly attractive group of females that promise to develop into cows that will place their sire high among the great transmitting sires of the breed. Other records recently completed in the Morris herd include Aralia De Kol Mead 2nd, with 886.6 pounds butter from 21,217.2 pounds milk in 305 days; Ignaro Creamcup Pontiac Burke, 716.16 pounds butter from 19,618 pounds milk in 305 days; Imperial Bonita Segis, 529.38 pounds butter from 15,211.8 pounds milk in 305 days as a junior two year old. These three are all daughters of Segis Pontiac De Kol Burke. Colantha Contenta Cream Cup 2nd made 748.13 pounds butter from 18,853.4 pounds milk in 305 days. Lady Valley Mead De Kol Walker, a junior two year old daughter of Prince Gelsche Walker, made 539.23 pounds butter from 13,452.5 pounds milk in 305 days. Two daughters of Segis Pontiac De Kol Burke now starting on their year have made creditable seven day records, Segis Pontiac Portia having 26.51 pounds butter from 582.8 pounds milk, and Segis Pontiac Prophetess 24.50 pounds butter in seven days as a senior three year old.

Not content with one sensational world's milk record, Carnation Stock Farms, Seattle, have annexed another one following close upon the tremendous record of over 37,000 pounds milk in one year recently announced for Segis Pietertje Prospect. The latest record was made by the junior two year old Carnation Matador Leda Segis, who has completed a 365 day test with 987 pounds butter from 26,080 pounds milk, the latter the world's milk record in class. As indicated by her name, she is a daughter of Matador Segis Walker, and is out of a daughter of Dutchland Governor Sir Colantha, a nick that is proving an exceptional one in the Carnation herd.

There is an unprecedented scarcity of grade Holstein cows in all sections of California at the present time, and this in the face of a tremendous demand for such cows due largely to the fact that many former dairymen are now turning away from cotton, rice, beans and other crops that displaced alfalfa production during the war.

Following a suit instituted against J. Peterposten, Galt, by the Northern California Milk Producers Association to compel the defendant to deliver his milk and cream to the association, Peterposten has filed a cross complaint in which he alleges that members of the association have lost considerable sums of money through the operation of the association and he seeks an accounting to explain certain expenditures.

The daughters of Prince Alcartra Korndyke, the son of Tilly Alcartra, heading The J. S. Gibson Co. herd of registered Holsteins at Williams, are keeping up their consistent production as shown by the results of recent official records. Among those to finish recently are Princess Roma Alcartra, with 30.01 pounds butter from 702.6 pounds milk in seven days; Roma Princess Korndyke Alcartra with 22.47 pounds butter from 453.1 pounds milk in seven days as a senior two year old; Sally Hengerveld Alcartra, with 21.91 pounds butter from 515 pounds milk in seven days as a junior two year old; Cornucopia De Kol Jewel Alcartra, with 17.06 pounds butter from 444 pounds milk in seven days

HOLSTEIN CATTLE

N. P. Hanson, Westbury, Minnesota, writes:

"Nine years ago I purchased my first purebred Holsteins, three young heifers and a bull. One of those heifers cost $175 and now has five daughters, four granddaughters and four great granddaughters. For the whole family a conservative estimate of their value is $15,000—not so bad for a $175 investment nine years ago."

as a senior two year old; King Korndyke Pontiac Alcartra, with 15.02 pounds butter from 357.1 pounds milk in seven days as a junior two year old; California State Fair Queen, with 18.02 pounds butter from 525.8 pounds milk in seven days as a junior three year old. Queen Pontiac Charlotte Korndyke, the great daughter of King Korndyke Pontiac, has increased her previous record to 31.11 pounds butter from 623.1 pounds milk in seven days. Three other good records recently made in the Gibson herd are those of Aaggie Korndyke of Nevada, 30.19 pounds butter from 704.3 pounds milk in seven days; Sigma of Linwood, 25.08 pounds butter from 569.1 pounds butter in seven days; and Lady Aaggie Oleander Alcartra, a senior three year old granddaughter of Prince Alcartra Korndyke, 22.20 pounds butter from 486.3 pounds milk in seven days.

The directors of the Pacific Coast Hereford Breeders Association held a meeting at Sacramento January 15 and perfected plans for their annual spring sale to be held at the university farm, Davis, February 23, during Stockmen's Week. It was decided to limit the number of entries to 60 head consisting of 40 bulls and 20 females. The bulls to be selected will be very high class range bulls and the females will be of a quality such as will appeal to both established breeders and beginners. Frank W. VanNatta, one of the best known Hereford experts in America, will make the selections for the sale. Word has been received that R. J. Kinzer, secretary of the American Hereford Breeders Association, will be present. As usual the sale will be held under the management of the California Breeders Sales and Pedigree Company of Sacramento.

The Holstein cows which the Maxwell Farms at Hollywood are bringing out from Iowa have about all arrived. A car of the test cows came in early in the month. Among them is the world's record junior three year old, K. S. P. Lily McKinley, with 37.62 in seven days. She has just finished a year's record as a junior four year old, of 1,175 pounds of butter. An other good one is Ormsby Buffalo Mercedes, a 33 pound cow who has also just finished a year's work with 1,164 pounds of butter. In the car were six junior two year old daughters of the great bull, Sir Ormsby Skylark, which are finishing yearly records. The average of the six will be above 900 pounds. With the cows Mr. Maxwell shipped his herd header, Major Pietertje Ormsby, a son of old Sir Piet and out of Bess Mercedes Korndyke, a high producing granddaughter of Sir Piet. The double cross Ormsby in this bull, combined wth that of Sir Ormsby Skylark through his daughters, is concentrating the Ormsby strain to a wonderful degree and makes the Maxwell Farm one of its foremost exponents.

The fourteenth annual meeting of the California Woolgrowers Association will be held at university farm, Davis, Friday and Saturday, January 7 and 8. Meeting will be called to order at 2 p. m. Friday. President Ellenwood urges sheepmen to attend this meeting. He writes: "With the wool and sheep market in its present condition, the need for association and cooperation among wool growers is more urgent, if possible, than ever before. With the change in administration at Washington and new tariff laws to be considered and urged before the new congress, it is important to the wool industry that the state association be in as strong a position as possible. If the growers generally will cooperate and support the association, their numbers and the investment they represent will be of sufficient force to get the attention of our congressmen and senators at Washington, to whom our needs in the way of tariff legislation will be urged. We cannot accomplish what we should and be the force we should without the support of the individual grower and we urge that you arrange to attend this meeting and that you also constitute yourself a committee of one to urge all the growers in your vicinity to a[illegible]"

THE 1921 GUARANTY SALE

50 REGISTERED HOLSTEINS

State Fair Grounds
Sacramento, Cal.

Thursday, March 17, 1921

Reg. Shorthorns—Fair Oaks Ranch, Wilits, California

RABBITS

Pedigreed Flemish Giants — Also Utility stock. No fancy prices. MAUD BEECHING, 1578 W. 46th Street, Los Angeles, California.

ITALIAN VINEYARD SALE

By Jack Klein

The first Berkshire sale at the Italian Vineyard, held on Tuesday, will long be remembered by all the big crowd present. The offering was one of the best ever by a single consignor and the average of $147 was the best in such a Berkshire sale in the state.

The breeders were all there and worked nobly to make it a success, and the spirit of fellowship which is so noticeable among Berkshire men was very much in evidence. When the third sow was in the ring a rip-roaring north wind laden with sand came tearing across the plain and from then on the bidding was done in deaf and dumb language. Happily, Col. Rhoades' back was to the wind, so he could talk without strangling. In spite of this handicap the sale moved swiftly and the prices were good.

Wilsonia Princess Laurel, a beautiful daughter of Laurel Champion, was the top at $350. She was bought by L. J. Frost, the editor of the Berkshire World, for E. J. Barker of Thornton, Indiana. This sow is a littermate to the great Barker boar, Real Type.

J. Francis O'Connor of Santa Rosa bought a daughter of Real Type for $225 and F. B. Kealiher of Anaheim took a Baron Duke 201st sow for $200.

The biggest part of the offering of 30 sows went to farmers and new breeders at prices ranging from $100 to $200.

The sale was admirably handled by Mr. Frost, Col. Rhoades and Alex Wilson, superintendent of the Italian Vineyard hog department, and will do a world of good for the Berkshires.

A detailed list of the sales will appear next week.

S. W. BERKSHIRE CONGRESS THRIVES

The annual meeting of the S. W. Berkshire Congress was held at Guasti on January 28. The report of the secretary showed that over $6,000 worth of hogs had been sold through the association sales during the year. Many new breeders had been started and the association membership increased from the original seven to 26. One of the unusual features of the report was that the bills are all paid and there is money in the treasury. For the following year these officers were elected: Roe Sanderson, president; Fred Hall, vice-president; Geo. Stingle, secretary. After the meeting a very excellent chicken dinner was served to the members and their wives and guests at the Oma Tea Garden at Ontario.

The Southern California Edison Company has been authorized by the railroad commission to issue $10,000,000 bonds for extension work, principally on the Colorado River.

Egg Laying Contest and Chicken Pox

By J. E. Dougherty

DURING the past few weeks egg production in the California Farm Bureau Egg Laying Contest at Santa Cruz has dropped somewhat because very many pullets went into quite a heavy molt rather soon after entering the contest. Although this condition was expected to occur as a result of the change to which the fowls were subjected when taken from their home pens and put into the contest, it has been more severe than was anticipated, especially among the later hatched pullets. Weather conditions have been very severe almost from the start of the contest and there have been only a few days when the hens could be allowed out in the yards.

The appearance of chicken pox in the flock the second week in November furnished a certain amount of interesting data on this disease which should be of extreme interest to poultry raisers. The first two cases appeared in one particular entry the second week of the contest, but in a day or two it appeared in another pen. As both of these pens came from the same shipping point the disease undoubtedly came from that territory and may have been contracted en route by contact with diseased stock.

Since this disease develops slowly it was the eighteenth of November before there was enough evidence of pox to make it advisable to vaccinate the whole flock. Dr. J. R. Beach of the veterinary division of the university vaccinated the entire contest flock November 23. Up to that time every case detected was immediately isolated in hospital quarters for individual treatment. During vaccination every individual was carefully inspected and every bird exhibiting the disease was sent to the hospital. Twenty-three cases were found and isolated.

Wherever the disease spread from one pen to another, it did so only through wire partitions and not where there was a board partition. Every other partition is of board construction, and although doors lead from one pen to another, through which the attendant walks in trapnesting, the disease has not, up to this time, been carried through these partitions. The obvious conclusion is that pox is spread by direct contact of diseased with healthy fowls.

The results of vaccination, as has always been the case when the operation has been carefully and skillfully performed, have been very successful, and the fact that 648 birds were vaccinated in a little over three hours shows how rapidly the work can be done.

That vaccination has no detrimental effect is clearly shown in the following table of egg yields for the three days preceding and the five days following the vaccination: Production November 20, 213 eggs; 21, 256; 22, 244; (vaccinated) 23, 229; 24, 264; 25, 220; 26, 218; 27, 233; 28, 243.

Past investigations have shown pox should be cleared up in about 30 days after vaccination and that all birds exposed to but not yet showing the disease when vaccinated are apt to develop a mild form of pox after being vaccinated. This occurred in the contact flock. Within three weeks after being vaccinated, a number of hens in pens where the disease had appeared developed mild cases, but recovery was very rapid.

All fowls showing the disease were vaccinated again November 29, and practically all these cases had fully recovered by December 10. December 11 a number of new cases were noticed in two other pens previously free from the disease and which had been vaccinated once as a preventive. It was therefore thought advisable to vaccinate a second time those birds that had been vaccinated only once, as the first vaccination does not always "take" effectively with some birds. On December 15 this second vaccination was given. The whole contest flock has now entirely recovered from the pox, and, strange to say, the hens which had a good attack are, in most instances, doing the best laying of any in the flock at present. Out of the 65 cases there were only two fatalities, and these were caused by the development of cankerous growths in the windpipe, which resulted in strangulation.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The five highest pens of ten hens each for the first two months of the contest are as follows:

Hollywood Farm, Hollywood, Washington, 409 1/3 eggs; J. H. Hanson, Corvallis, Oregon, 363 1/3; George Gray, Santa Cruz, 345; S. L. Gibson, Santa Cruz, 343 1/3; E. L. Spacker, Santa Cruz, 342 2/3.

The blue ribbon winner for the highest December production is pen No. 32, owned by Hollywood Farm, Hollywood, Washington, with a production of 199 2/3 eggs. J. H. Hanson, Corvallis, Oregon, carried off the red ribbon for second highest production of 194 eggs, and S. L. Gibson of Santa Cruz won the third ribbon with a yield of 156 1/3 eggs for the month. George Gray of Santa Cruz was fourth highest with a production of 154 eggs, and E. L. Packer of Santa Cruz ranked fifth with a yield of 143 1/3.

Hen entered by Hollywood Farm carried off the blue ribbon for December by laying 27 eggs in 31 days. Hollywood Farm, J. S. Conrado, J. H. Hanson and Oregon Agricultural College tied for second place with a record of 25 eggs each. The struggle for third place for the month closed with a tie between La Rita Farm, J. H. Hanson, G. N. Bolfing and hens of Hollywood Farm, each laying 24 eggs.

Fractional figures in pen yields are caused by floor eggs being equally divided between the three entries of ten hens and two alternates in each lay pen.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The leading pens for ten days ending January 20 at the California Farm Bureau Egg Laying Contest at Santa Cruz are: La Rita Poultry Farm, Santa Cruz, 78 eggs; Hanson's Poultry Farm, Corvallis, Oregon, 74; W. A. Ford, Umatilla, Oregon, 73; R. J. Kenter, Santa Cruz, 71; Oregon Agricultural College, Corvallis (Barred Rocks), 70; S. L. Gibson, Santa Cruz, 70; S. L. Gibson, Santa Cruz, 67; W. H. Marshall, Santa Cruz, 67; Santa Barbara Poultry Ranch, Santa Barbara, 67; C. E. Hyde, Santa Cruz, 62; Bellows Bros., Lakeside, 61; Alex Stewart, Santa Cruz, 60; Enterprise Ranch, Chino, 60; Mrs. H. C. Kleinsmith, Hoff, Oregon (Barred Rocks), 60; S. L. Gibson, Santa Cruz, 60; S. L. Gibson, Santa Cruz, 60.

Leading pens to date: Hanson's Poultry Farm, Corvallis, Oregon, 486 eggs; Hollywood Farm, Hollywood, Washington, 478; S. L. Gibson, Santa Cruz, 461; Geo. Gray, Santa Cruz, 453; W. H. Marshall, Santa Cruz, 450; W. A. Ford, Umatilla, Oregon, 424; E. L. Spacher, Santa Cruz, 422; La Rita Poultry Farm, Santa Cruz, 388.

Lima bean growers of Orange County are starting a determined campaign to increase membership in California Lima Bean Growers Association. Orange County directors in the association are W. C. Jerome of San Joaquin Association, Edward Chaffey, Garden Grove, and C. W. and C. E. Ward, Smeltzer.

Feeding Melons

I would like your opinion on feeding melons and cantaloupes to chickens. During the season I raise both and often have carried over stock which has been given to my chickens. It seems to me the chickens have not done well since.—H. E. S., Sunnyside.

Melons are all right if you do not feed too many of them—so many, that is, that they keep the birds from eating greens and other feed they need for health and production. Melons do not take the place of succulent greens like barley, alfalfa, kale, chard and lettuce, neither do they contain much material for egg manufacture. According to Professor Jaffa the pie melon, which does not differ materially, I presume, from others, contains 94.5 per cent water, 2.88 per cent starch and sugar, 0.77 per cent protein and only 0.4 per cent ash, which is far less than is contained in most other vegetables or in green feed. Water is necessary, of course, but if you let your hens fill up on melons, what nourishment they get is starch and sugar instead of protein, and starch and sugar do not make eggs. The melon rinds from your table or mine are not enough to do any harm, though my hens never seem to care much for them, but, as you can see from their composition, they cannot possibly take the place of real egg food.

Chicken Pox

Our hens have sores on various parts of their heads. These sores have a hard, bulging scab and seem very tightly grown to the skin. One Brahma pullet has a large scab about the size of a pea right over one ear, completely covering it. There is a watery discharge from the nostrils and some of the hens have a kind of foam in the eyes, followed by a swollen eyelid. Their combs are a bright red and their plumage is smooth and bright. About a month ago we brushed their heads with coal oil to rid them of stick tight fleas and head lice, and some of them have been fighting and picking each other. Could either of these be the cause of the sores?—Subscriber, Julian.

As you say, only a few of the hens have these sores and they are accompanied by roupy discharges in eyes and nostrils, I am inclined to think you have chicken pox in the flock. There is not much you can do, only keep the affected hens away from the rest. If you isolate them immediately it may be the disease will not spread through the flock. You might rub the sores with carbolated vaseline and add about five per cent flowers of sulphur to the mash, but chicken pox has to run its course. If your flock is large it might be well to write the poultry division at Davis about vaccinating them. It would hardly be worth while for a small flock. I doubt if the kerosene on their heads would cause such scabs as you describe, but kerosene is a rather severe remedy. Carbolated vaseline rubbed on the head several times will kill stick tight fleas, and any good louse powder will kill the head lice. If the sores are caused by the birds' fighting, which seems unlikely, there is no better remedy than carbolated vaseline.

Chicken House Plans

Will you publish or send me plans for building or arranging chicken house and grounds in small way. I have a space 60 by 38 that can be used for yard. Would 32 feet in width or less do better? I had in mind a house 12 by 16 feet, placed in center of long side of yard, with end on line of fence?—B. L., Los Angeles.

As you do not say how many hens you wish to keep, I cannot make my advice as definite as I might. A house that is nearly square is more economically built than a parallelogram, and 14 feet square is a very good size, if it is not too large for your purpose. Such a house provides comfortable accommodation for from 60 to 75 Leghorns and 50 Rocks or Orpingtons. A house ten feet square will hold from

Wheat: Mixed feed Utah-Idaho, 36.75.
Barley: 1.51¼.

HAY

Alfalfa Growers of California report under date of February 2:

Receipts of alfalfa for the week again light, below the current rate of consumption, stimulating the demand to a corresponding extent; the week closed with the market firm and practically no change in prices.

There were 600 tons received on the tracks in Los Angeles the week ending January 29, with 40 tons hold over as against 460 tons the week before.

Rabbit	39.00
No. 1 dairy	27.00
Standard	24.00
Stock	19.00

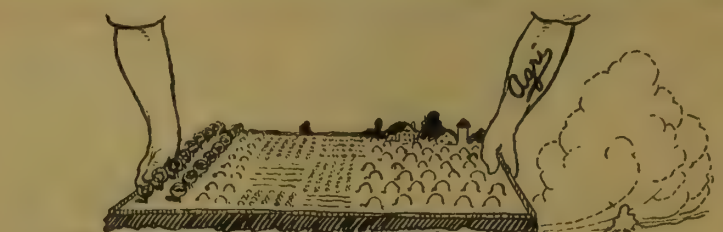
Tame Oats	20.00@24.00
Barley	18.00@22.00
Alfalfa	18.00@26.00
Barley straw	8.00@12.00



Changes **Black Alkali** to productive soil

AGRI Gypsum is a specific for black alkali. It corrects the deadly effects by chemical change.

The harmful sodium carbonate of the alkali is transformed into harmless calcium carbonate, or the less harmful sodium sulphate, practically giving you a new soil which is fertile and productive.

AGRI Gypsum supplies calcium and sulphur, adds nitrogen, and releases potash. It is an ideal all-round fertilizer, highly efficient yet low in cost.

Send us a sample of your soil for free chemical analysis and we will advise the correct application for your individual problem.

Did You Ever Know

That Rome Was Not Built in a Day?

Neither was the "ACTUALLY" trap-nested ENGLAND strain of S. C. White Leghorns or any other strain of fowls or stock—for that matter.

It has taken us nine years of hard work and careful breeding to put this strain in the front ranks of Poultrydom.

If you are interested in hatching eggs from hens with "ACTUAL" trap-nest records in excess of 200 eggs for their twelve-month Pullet year laying, please send for CIRCULAR NUMBER ONE.

We can fill orders for settings upon three days' notice.

ENGLAND'S EGG RANCH

Geo. C. England, Owner

The home of "ACTUALLY" trap-nested S. C. White Leghorns every day in the year since 1912.

Milo: Cal. Red, 2.00@2.05; Eastern, 1.60@1.70.
Kafir: Eastern, 1.60@1.70.

HAY

Alfalfa Growers of California under date of February 2:
There were 488 tons received in San Francisco the week ending January 29, as against 967 tons the week before.
No. 1 Dairy Alfalfa.....21.00
Stanard 19.00
Under date of January 29, A. W. Scott Co. says:
Receipts of hay past week have been 488 tons. Prices remain unchanged, although with marked improvement and pickup in the volume of business both in San Francisco and throughout the country. General business seems to be reviving from the stagnation prevailing during the month of December, and this activity in general trading is apparent in the hay trade. Export trade continues light, while trading throughout the interior has increased very materially. Alfalfa seems to be doing more poorly than any other grade of hay and the local product is suffering from Nevada competition.
We quote today wholesale prices in carload lots as appear from dealers' transactions upon the hay market in San Francisco (for prices to consumers charge of cartage, commission and handling expenses must be added, according to conditions).
Wheat Hay, Fancy.....20.00@21.00
Wheat Hay, light 5 wire bales.17.00@20.00
Tame Oat Hay, fair to choice..17.00@19.00
Wild Oat Hay.....12.00@15.00
Barley Hay .....12.00@15.00
Alfalfa Hay .....17.00@20.00
Stock Hay .....10.00@14.00

Citrus Markets

Los Angeles, February 2, 1921.

The rains of last week stopped picking, consequently slowing up of shipments and a temporary flurry in prices is encouraging at this moment heavy shipping. Most houses are holding steady, however, and there is little danger of a break. There have been slight reductions on smaller sizes and effort is being made to prevent picking of the little ones. F. o. b. California prices are ranging around $4.00 and $4.50.
The lemon market is dead with quotations f. o. b. California $2.25-$2.75.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 4,472 cars; lemons, 1,347; total, 5,819. To same date last season: Oranges, 5,626; lemons, 1,159; total, 6,785. From Central California to date, this season: Oranges, 3,973; lemons, 66; total, 4,039. To same date last season: Oranges, 3,412; lemons, 160; total, 3,572. From Northern California to date this season: Oranges, 301; lemons, 3; total, 304. To same date last season: Oranges, 261; lemons, 20; total 281.

POULTRY QUERIES

(Continued from Page 189.)

25 to 30 birds. If I were you I would build this house in the middle of my yard space and divide space into four yards of equal size. By making an opening from the house into each of these yards you will be able to run your flock in one or two while a green crop is growing in the others. In this way you utilize the manure and at the same time purify the soil. You can raise vegetables in the yards that are not being used for the hens, if you wish, and then turn the hens in when your crop is harvested. If you do not wish to build so much fence put the house crosswise of the yard, in the middle, and divide it into two yards, one at the back and one in front of the house. The house should front south or east, should be about 7 feet high in front and 5½ at the back and should have a shed roof covered with either shingles or tarred paper. The sides can be built of coarse lumber battened. Many of these shed roof houses have some kind of canvas or wooden screen or shutter hung from the front edge of the roof to keep out sun and rain. The droppings board is about three feet from the flour and fills the rear half of the house. The roosts may be hung by wire from the roof and should be about 18 inches apart. Nests and feed hoppers are built along the front of the house. I will mail you names of several poultry ranches you may like to visit before you build. Houses are difficult to describe on paper and one gets many valuable ideas by visiting experienced poultrymen.

The Call of the Hen

A subscriber whose letter has been mislaid asked for the name of the publishers of Walter Hogan's book, "The Call of the Hen." The book may be had from the Petaluma Journal, Petaluma.

GERMOZONE

"the Best Remedy for Poultry and Pet Stock"

The old reliable, proven remedy for Roup, Colds, Canker, Swelled Head, Bowel Trouble, Snuffles, Wounds, Sores, Loss of Fur or Feathers, Skin Disease, Etc.

H. A. Kiewert, 5042 N. Long Ave., Chicago, Ill., says: "I had some of the worst kind of cases of roup in my chickens and I thought I would not save any but I have saved these birds, thanks to Germozone." H. A. Haines, Rosalia, Kas.: "If we had tried Germozone at first it would have saved us $1,000 worth of expensive experiments." Mrs. T. A. Morley, Galien, Mich.: "Have used Germozone 17 years and could not get along without it." E. W. Thiel, Waukesha, Wis.: "I have used your Germozone for white diarrhoea in baby chicks and sure got wonderful results. I also use it right along on grown fowls."

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages, from Omaha. Poultry Book and Book on Diseases FREE.

For less gas engine trouble in your busy season

—install the best piston rings now!

Leaky piston rings are responsible for most oil and carbon troubles, loss of engine power, and waste of gasoline and lubricating oil. By using rings which are properly designed and manufactured, you can largely prevent the expense and annoyance of these common engine faults.

McQuay-Norris Equipment represents ten years of successful experience in piston ring engineering. A Superoyl Ring in the top groove of each piston keeps oil out of the combustion chamber. This saves waste and decreases oil and carbon troubles.

The genuine Leak-Proof Rings in all lower grooves prevent the waste of fuel. Their equal radial pressure keeps gas from wasting past them—turns it all into power.

Your dealer can sell you both rings in every size or oversize.

Always install the combination

The GOPHER TRAP That NEVER FAILS

Catches Old, Young, Big or Little Gopher

You Can't Catch Big Gopher Like One Above In A Small Trap

Above cuts from photographs tell the whole story. This trap has been in use for two years. All users say it **Never Fails.** Poisons are dangerous. Don't lose time and patience trying to catch the gopher with an ordinary box or cheap wire trap. Buy the **Double Catch Trap** and get the rodent first time. If your dealer cannot supply you, write to us. **Price 75c postpaid.** Money returned, if not satisfied. Illustrated circulars free.

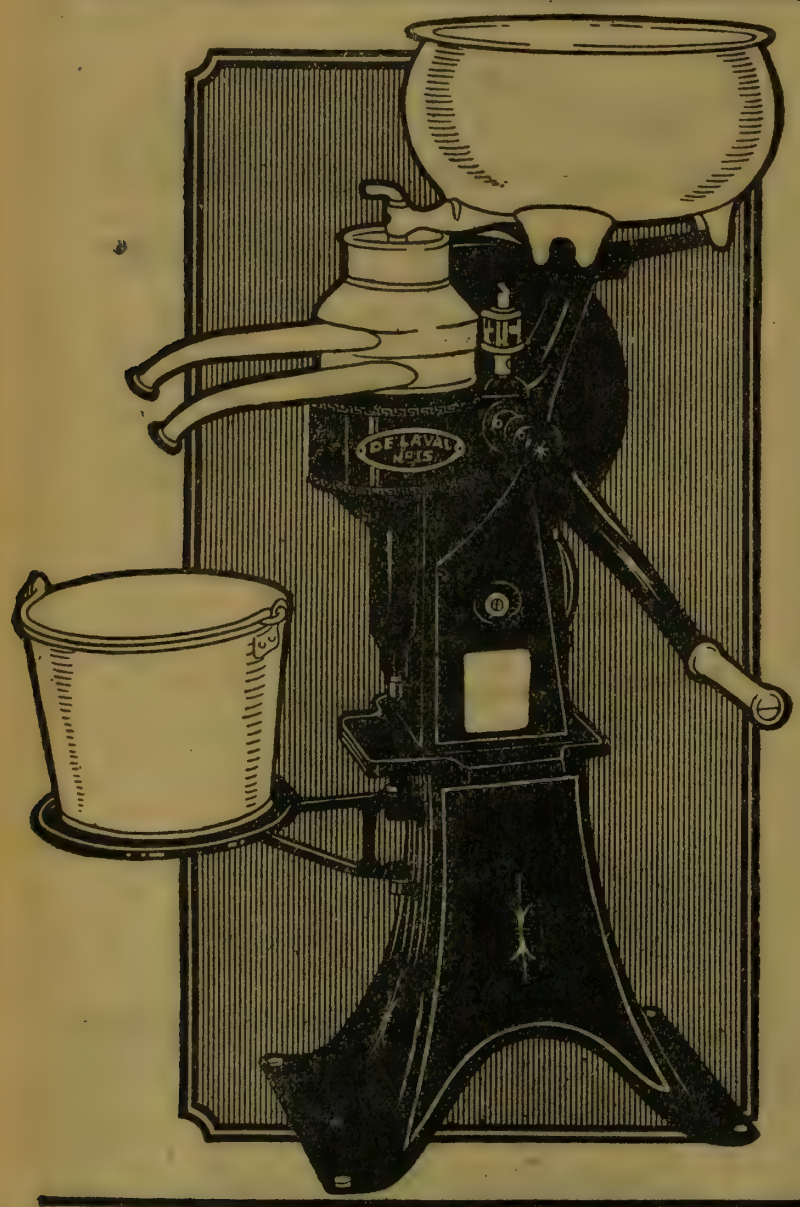
5 CENTS a day invested in a DE LAVAL may save you from 25 cents to $1.00 a day



A DE LAVAL Cream Separator is the best paying investment any cow owner can possibly make.

It saves twice a day, 730 times a year, over any other system or inferior separator—in quantity and quality of product, time and labor.

Its cost represents an investment of about 5 cents a day for ten years, including cost of operation and interest on the investment. With simple care it will give good service not only for 10 but for 20 to 30 years; it practically never wears out.

Such an investment may save you from 25 cents to $1.00 or more a day, according to the number of cows, returning from 500% to 2000% profit on the investment. Every day you delay the purchase of a De Laval you waste and lose money.

Today a De Laval Cream Separator, considering its improvements and quality of construction, is one of the cheapest things you can buy. With cheaper feeds and butter-fat at present prices there is more profit today in butter-fat than there was a year ago. Relatively, a De Laval is cheaper than it was a year ago.

See your nearest De Laval agent now about getting a new De Laval. Even though you have only one good cow, it will pay you to own one.

De Laval Dairy Supply Company

61 Beale Street **San Francisco**

Sooner or later you will use a De Laval Cream Separator or Milker

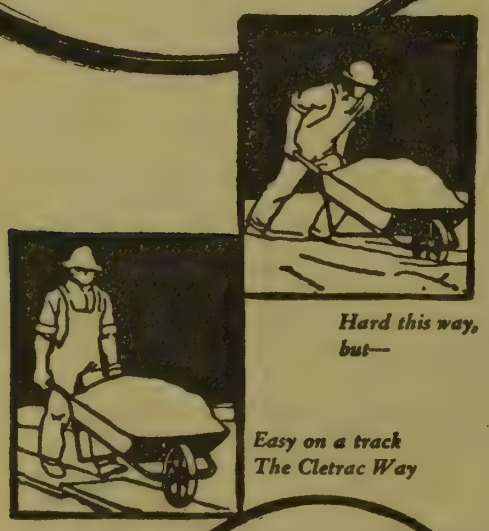
Cletrac
TANK-TYPE TRACTOR



Hard this way, but—

Easy on a track The Cletrac Way

Specifications

Horsepower: 12 at drawbar, 20 at belt pulley.

Length: 96 inches.

Width: 50 inches.

Height: 52 inches.

Weight: 3420 pounds.

Turning Circle: 12 feet.

Traction Surface: About 800 squares inches.

Center to Center of Tracks: 38 inches.

Belt Pulley: Dia. 8 inches; face, 6 inches.

Cletrac Holds an Acre-an-Hour Gait

First on the field in spring, Cletrac strikes a steady acre-an-hour gait — turning well-mulched furrows and completely burying the cover crop. And it's a fast, steady pace it holds no matter what work you put it to—cutting cost and increasing production.

Cletrac's two broad, ground-gripping tracks distribute its weight evenly and lightly for working over soft and uneven ground. That is why it rides powerfully ahead regardless of the condition of the soil—like a wheelbarrow on a plank.

Cletrac turns short—swings quickly back to the furrow without loss of time or power. Built low, without projections, it weaves easily in and out around trees without injuring them. Its water air-washer always gives plenty of cool, moist air — keeps the motor running smoothly in scorching, dust-heavy summer.

The Cletrac replaces six to eight horses—does practically any jobs they do—and is fresh enough at the end of the day to continue through the night at emergency pumping or other belt work if need be. You can handle more acres with a Cletrac, and still have plenty of time and power to put into each of them.

See your dealer for full details of how the Cletrac does more work at less expense—or get them by writing today for the whole story in the interesting booklet, "Selecting Your Tractor."

The Economics of Better Livestock

By R. P. Royce

THE average California steer is marketed at three years of age weighing around 1,100 pounds. The average California hog reaches market somewhere around 15 months of age, averaging perhaps 200 pounds. The average California dairy cow produces less than 200 pounds of fat per year.

The average livestock owner says he is not making any money—and as he probably knows more about his business than anyone else, he is doubtless correct. Let a group of average producers get together and, after commiserating each other on the general state of affairs, they will analyze the situation until they have ascribed their condition to many and sundry causes. We have been listening in on these conferences for a good many years. Generally speaking, the market manipulators come in for a large share of the blame (and justly), the high price of feed, the drouth, the flood, the high cost of labor and a hundred and one other contributing factors are mentioned, but it has been on very, very few occasions that the writer has ever heard Mr. Average Man go so far as to suggest that possibly he himself had something to do with his own troubles. In short, Mr. Average Man—"we, all of us"—is an out and out devotee of the great American sport, passing the buck. A pleasant sport to be sure, but less fruitful of concrete results than that other American pastime, the successful playing of which depends upon hitting the ball.

If more of us would devote less time in passing the buck of our failures to the middleman, the tariff, the railroads and the hundred other popular causes and would face our problems squarely and fearlessly, we might learn a lot that could be turned to our individual advantage. And among many of the things that we might learn would be the following facts:

Life has never set a premium on inefficiency, and never will.

Any great movement that requires mass effort in the end is successful to just the extent of energy and intelligence manifested by the units making up the mass.

Now we grant that there are many vital problems that the agricultural industry must solve if that industry is to progress, and the solution of such problems will require a united force. And such being the case, it must be obvious that before great progress is made the units within the mass must direct their efforts in the direction in which they plan organized movement.

There is too great tendency on the part of producers to expect results approaching the millenium without being willing to make individual effort. Individuals form themselves into groups for a definite purpose, nine times out of ten to increase the profitableness of their business. Leaders are selected and then the individuals too often fold their hands and wait for the lightning to strike. Nature has a way of compensating effort in about the proportion of the effort expended.

Suppose, for instance, you happen to be Mr. Average Dairyman. You are engaged in a good business, but you don't feel that the returns justify your efforts; the margin between cost of production and selling price is too narrow. You have joined an association organized for the purpose of widening the margin. Aside from stopping some leaks and saving the private manufacturers' profit, there are but two ways under heaven to widen the margin that spells profits. One is to increase the selling price and the other is to cheapen the primary cost of production. Organized effort can increase the selling price only to the point that will not restrict consumption. Organized effort cannot materially lower your cost of production. The latter problem is your job and no one's else. If for a moment you figure otherwise you are doomed to disappointment. You can organize and organize again, and keep on organizing until the "cows come home," but until you are willing to set your own barn in order your situation will not improve.

If you are Mr. Average Rangeman or Mr. Average Swineman or Mr. Average Sheepman your situation is in no way different in the main from the case of the man who owns dairy cows. You must put your own business in order first.

There is no more vital problem facing the livestock producer than getting his business down to the lowest possible cost of production, and it is the wise man who will lose no time or effort in organizing his business along lines calculated to cheapen his costs.

The average producer would doubtless be sorely offended if he were told he was not a good business man, but when the fact that the average dairy cow produces only about 200 pounds of fat per year and that there are many dairies where production will average from 300 to 500 pounds of fat, that the average steer will go into market at three years of age weighing 1,100 pounds while other range operators market steers of the same age weighing above 1,500 pounds, and that it is possible to market 200 pound hogs at seven to eight months of age instead of 15 to 18 months, what can he say for himself?

He cannot credit the difference to luck on the other fellow's part because the other fellows haven't been lucky. They have not accomplished such results through any miracle, except through the miracle of better blood. Let any doubting producer investigate the causes back of increased production and he will find that credit must be given to the use of better sires, and of course better methods of feeding and management.

The possibility of increasing the production of meat and milk through the use of good pure bred sires has not begun to be appreciated, in spite of the fact that on every hand there is ample evidence. Indeed, there is scarcely a community where some one or a few have not pointed the way.

One of the most striking examples of dairy improvement was brought before the public by the published results of an experiment that has been carried on at the Iowa state experiment station. In starting the experiment scrub cows, typical piney woods cows, were secured from an isolated section of Arkansas in which no pure bred bull had ever been used. The cows were taken to Iowa and given ordinary good care and mated to carefully selected pure bred bulls. The experiment has been running long enough to secure data on the second generation.

The daughters of the original cows averaged 2338.5 pounds of milk and 89.68 pounds of butter fat more than their dams. The increase amounted to 64 per cent in milk and 52 per cent in butter fat. The granddaughters of the original cows by pure bred bulls produced 4741.7 pounds of milk and 186.6 pounds of butter fat more than their granddam, the increase amounting to 129 per cent in milk and 109 per cent in butter fat. The two crosses more than doubled the production!

In a Wisconsin cow testing association it was found that the average production of the cows in herds using pure bred bulls was 6350 pounds of milk and 295 pounds of butter fat. In herds headed by grade and scrub bulls the average production per cow was 5009 pounds of milk and 215 pounds of fat.

The writer knows of another case where the production of the daughters was 30 per cent greater than that of their dams.

The Napa state hospital herd of grade Holsteins has had the benefit of good pure bred bulls for 18 years and now has an average production of over 490 pounds of fat (figuring the average number of cows in milk). Up in Humboldt County, noted for progressive dairying, there are many grade herds with high production. John Hansen of Loleta had a herd of 101 cows with an average production of 6635.5 pounds of milk and 339.65 pounds of fat. J. W. Coppini, Ferndale, who won one of the California Cultivator prizes in the 1916-18 state dairy cow competition, had a herd of 22 cows that averaged 510.09 pounds of fat. Iver Iverson, Arcata, another Cultivator winner, had 37 cows that averaged 497.73 pounds of fat, and W. Terkelsen of Ferndale averaged 420.46 pounds of fat for 53 cows. Aux Ambort of Holtville had 29 grades that averaged 357.39 pounds of fat.

And so it goes. There are hundreds of cases that might be cited to show the value of a pure bred dairy bull, and there are thousands of cases that might be cited to indicate the worthlessness of a scrub side. The pity of it all is that we have so many men trying to make a living from cows, who refuse to put into practice methods that have been proven sound. We have plenty of sympathy for the man who is working in ignorance, but we have little or none for the man who says that "all this talk about better bulls is just bunk." He is the man who talks loudest against conditions surrounding his industry, who rails at the middleman, the manufacturer, the consumer and "the whole works" and who expects his association to extort a higher price from the public, but who fails to appreciate the necessity of doing something himself.

The possibility of increasing the profitableness of beef production through a wider use of pure bred bulls is equally as definite. And here again, the wonder of the situation is the apparent indifference of range operators to the sort of bulls that they use. Go into any range section and it will be noted that the average quality of cattle is very common. The native cows are small, lack the proper conformation and fleshing qualities they should have. Inquiry as to why such cattle are handled instead of better sorts usually is met with the statement that the range is no place for pure bred bulls—they are "too fancy" for the average operator who prides himself on being "practical." The statement is usually added that "anyway we can't afford to pay high prices for bulls as the profits in cattle raising are too small." Sure, the profits are small; the profits have been getting smaller each year in proportion to advancing costs of operation and unless cattlemen take steps to meet the situation the point will soon be reached where there is no profit. Nothing can be more certain than the last statement. The man who expects to be able to "get by" in the future by using methods that might have been satisfactory 30 or 40 years ago has no business raising cattle. Who is entitled to claim attention from the consumer—the man using scrub or grade bulls and who markets his steers at three to four years of age, weighing from 1,000 to 1,200 pounds, or the man who has invested in pure bred bulls and has graded up his cow herd until he can turn off his steers a year younger, weighing 30 to 50 per cent heavier and of far more desirable quality?

Look over the range business in this state and take note of the men who are making the most money. Are they using $100 bulls? They are not! The men who are making the most are the men who are using well bred bulls. Take the biggest outfits—what sort of bulls are they using? Ask Henry A. Jastro, the best posted cattleman in California, what he thinks of the value of good blood. Ask C. N. Hawkins of the Pacheco Cattle Company what he thinks of pure bred bulls—he might tell you that they have increased the weight and selling price of their steers to a point where they market three year old grass steers averaging over 1,500 pounds and that they always command a premium above the common stuff. Study the results of the Sni-A-Bar experiment and learn how pure bred bulls used on common cows increased the weight and selling price of the calves until the second cross calves fetched $48 more than calves of the first cross. Are such results practical or not?

The value of better boars and sows is too generally conceded to require

(Continued on Page 224.)

Agricultural News Notes of the Pacific Coast

Northern California

The Willows Journal asks, "Why not a rice day?"

Sonoma County fair will be held at Santa Rosa August 24-28.

The Sacramento River reached 25 feet last week, the highest mark of the season.

The Paradise farm center of Butte County held its annual meeting and election February 8.

The Pacific Rice Growers Association has asked members to hold their 1920 rice until prices pick up.

Fruit grower members of the Alameda County farm bureau are organizing a horticultural department.

California grape growers recently met in San Francisco and voted to continue the Exchange another year.

Poultry demonstrations by R. B. Easson are being planned for various centers of the Butte County farm bureau.

The Martinez chamber of commerce and the Escalon farmers bureau are among those who have endorsed the Marshall plan.

The Butte County farm bureau is conducting a very successful membership campaign and expects to enroll at least 700 members.

Large plantings of barley are expected to be made in Yolo County. Seeding has been held back on account of rainy weather.

The Pea Growers Sales Union of Alameda County now has 599 members located in Hayward, Decoto, Niles, Irvington, Warm Springs and Milpitas.

At the recent meeting of the California Grape Growers Exchange in San Francisco special attention was given to problems of construction of dehydration plants.

Glenn County sent a representative of rice interests to Washington to take up matter of exporting rice to China as a means of relieving oversupplied market of California.

A quantity of low grade wool brought into a pool by the California farm bureau has been consigned to the National Warehouse Company at Chicago. One sale was recently made in the East at 23 cents a pound.

Stockholders of the Yolo County Farm Loan Association are reorganizing and getting ready for decision of the supreme court, which it is hoped will come soon, and permit continuance of the farm loan bank.

California Wool Growers Association has named the following committee to look after legislative matters affecting the interests of sheep men: G. N. Merritt, Woodland; G. B. Wilcox, Red Bluff; Peter Moy, Stockton.

The State Pear Growers Association recently met and reelected the old board of directors. $50,000 has been appropriated for a nation wide advertising campaign. Frank Swett of Martinez is president and F. A. Edinger of Sacramento, secretary-treasurer.

At a recent meeting of the California Wool Growers Association G. K. King of Red Bluff, Charles Hansen of Butte City, G. K. Swingle of Davis, Peter Moy of Stockton and C. A. Kimble of Hanford were named a committee to confer with Dr. Iverson of the state department of agriculture on dipping of sheep.

Central California

Raisin Day, Fresno, April 30.

Turlock is endorsing the Marshall reclamation plan.

Tulare's last fat hog auction resulted in selling seven cars around the $11 mark.

Tulare County reports its rainfall as more than double that of last year same date.

Fresno reports its seasonal rainfall totals 5.21 this year, as against 2.20 last year same date.

San Joaquin Light and Power Company will increase its capitalization from $25,000,000 to $150,000,000.

The State Association of Holstein-Friesian Breeders will hold annual meeting at Modesto, February 10.

San Joaquin Valley League of Municipalities has appealed to the state legislature to abolish the state railway commission.

Tulare County auto drivers have been testing out jackrabbit speed on the highways and find they can beat 50 miles per hour.

The second payment on 1920 raisin crop is being made by the Associated Raisin Company. It will total approximately $15,000,000.

A meeting of grape growers was held in San Francisco, January 28, to discuss more thorough standardization of grape pack.

Stanislaus County has most successful farmers mutual fire insurance company. It recently settled a large fire loss within few days from fire.

Owens Valley pear growers have organized and will market through their association. W. W. Watterson is president and A. A. Shirley, secretary.

Donald L. Currier has been appointed horticultural commissioner of San Benito County, succeeding Leonard Day, for many years holding that office.

A cantaloupe shipper of Modesto, Stanislaus County, is suing the railroad because of loss of two cars of cantaloupes last season by slow freight.

Kern County farm center meetings: Delano, February 14; Old River, 15; Wasco, 16; Rio Bravo, 17; Edison-Fairfax, 18; Mountain View, 21; Pond, 23; Inyo-Kern, 24; Rosedale, 25.

The state legislature has adjourned for its usual recess. Will convene again February 24. Over 2,000 bills were introduced. The state controller reports the first session cost $52,039.

The Turlock and Modesto irrigation district has filed suit against the San Francisco Power Company, asking condemnation of ditch which runs through proposed Don Pedro reservoir site.

The recent annual meeting of the Milk Producers Association of Central California, held in Modesto, resulted in complete harmony and election of 14 directors for the coming year. Three of these were reelected from the former board.

A committee of irrigators of Kern County has made during last week a tour of various irrigated sections of the South, investigating as to engineering, finance and other problems connected with cooperatively organized irrigation districts.

Southern California

Escondido reports peaches in bloom January 15.

Don't forget to celebrate Ripe Olive Day February 21.

San Dimas orange by-products factory is again in operation.

San Bernardino County farm bureau boosters propose to double membership.

A count of the Orientals in Ventura County shows 661 Japanese and 153 Chinese.

A new farm bureau center has just been organized at Yucaipa, San Bernardino County.

Smeltzer and Wintersburg sections of Orange County have disposed of last season's bean crop.

Cotton growers of the Perris Valley of Riverside County have decided to plant only Durango seed.

The Garden Grove Bean Growers Association has closed its bean house, which has been open since September.

A woolen mills at Santa Ana is planning to work up California wool into auto robes. It began operations February 1.

The Associated Chambers of Commerce of Riverside County have endorsed the Packard plan for flood control.

Thermal, Riverside County, cotton growers have formed an association which will plant only the Acala variety.

Twenty Florida orange growers are making a trip to California in order to visit the National Orange Show, February 18-28.

Victorville and Hesperia sections of San Bernardino County show the best of prospects for big fruit and, in fact, all other crops.

Dairymen distributing milk in Los Angeles County have made a cut in retail price of two cents per quart, effective February 1.

The farm bureau center at San Juan Capistrano in Orange County has elected Aaron Buchheim president and H. H. Blee secretary.

W. V. Shear, certified seed potato inspector, addressed a meeting of potato growers, dealers and seed men at San Diego January 26.

Citrus growers of the Orange County Fruit Exchange have fixed on a wage scale of 15 to 20 per cent below that prevailing last season.

State inspection of carlot shipments of lettuce began in the Imperial Valley January 21. One inspector is located in Heber and one in Brawley.

The California Walnut Growers' Association has secured a quantity of black walnut seed from Santa Clara Valley for planting by its members.

Prof. F. T. Bioletti of the state university was at Blythe, Riverside County, January 25 and 26 to advise growers as to best methods of planting and growing vineyards.

The La Habra Walnut Growers Association held its annual meeting January 15 re-electing R. W. George, president; A. E. Harris, vice-president; George Eaby, secretary-treasurer; directors, R. W. George, W. J. Gregory, H. E. Hart, George Eaby, I. Henry Johnson, A. M. Otis, A. E. Harris.

The Coast and General

Arizona has 1,034 pure bred Holsteins.

Utah reports feed and livestock conditions good.

A $5 poll tax has been proposed in the Oregon legislature.

Farm bureau state federation has been formed in Oregon.

Michigan potato growers are appealing for tariff on potato flour.

Japanese grown oranges are being shipped to Winnipeg, Canada.

Indiana state vegetable growers have organized a marketing association.

Montana's winter season so far has averaged warm, with good range conditions.

New Mexico stock ranges need more moisture to put the feed in good condition.

The sixteenth annual convention of the Tennessee Horticultural Society just closed at Nashville.

Citrus growers of Florida have fixed a maximum of $3.75 per day for labor in groves and packing houses.

New York is again receiving shipments of broilers from China. They average about two pounds to the bird.

The New York state association of sealers and weights and measures is urging the legislature to pass a law requiring sale of berries by weight.

Transportation companies and government experts are trying out heating devices in apple shipping cars from Wenatchee, Washington, to the East.

The Idaho Farm Bureau Federation at its recent annual meeting at Nampa adopted a new constitution that will practically make it a marketing association.

Several cars of eggs have just been received in New York from China by way of San Francisco. Large shipments have also been received from Argentina.

A boys and girls' sheep club has been organized in Kittitas County, Washington. Each member starts with three head of pure bred Hampshire ewes.

Figures given out by the Holstein-Friesian Association of America show 352,071 pure bred Holsteins in the United States with New York the leading state in number.

The farm bureau of Whatcom County, Washington, purchased 81,000 pounds of stumping powder for members the past year. It expects to make heavier purchases the coming year.

Texas tomato growers are organizing with hope or securing better market, but many growers are urging discontinuance of planting unless a decrease may be had in freight rates.

Poultry papers are giving space to announcement of a 28 carload shipment of Chinese eggs received at New York within the past week. These eggs were received at the port of Vancouver.

The Kittitas farm bureau of Washington has 719 members, an increase of more than 100 per cent over last year's membership. For the entire county 77.5 per cent of heads of families in farming communities have become members of the farm bureau.

Pear Blight Control

By James Mills Jr.

AS all pear growers know, this has been the worst year for blight in trees for almost the last 20 years. As there will be a large amount of holdover blight in the pears in evidence next year, and as this blight will spread rapidly if conditions are propitious, a history of the blight control on a 350 acre pear planting might help in the control work for next year's campaign.

Three years ago the writer was fortunate in being able to take a trip to Hayward Reed's pear planting at Vina, where he happened to see the head blight man at work treating trees infected with blight, by Mr. Reed's new system. The same year, with Mr. Reed's able advice, and the next year, trees on this large planting were treated successfully by this new system. This year, however, the infection was so widespread that control measures were very difficult. Late in the year Mr. Reed was kind enough to send his head man to our properties to assist us in the use of his new system.

In planning all future work the factors which we find have to be borne in mind continually are as follows:

Pear blight is a bacterial disease.

Active blight cases exude a bright sticky exudate. This runs very rapidly during the rainy season and during wet and muggy conditions. This year we had heavy winds during the wet periods, and this scattered the exudate all over the trees, causing numerous infections. The trees should not be touched and none of the cases should be treated when the trees are wet with dew. Later on in the day, if it is warm and the exudate hardens and does not drop off when the tree is shaken, it is possible to carry on the work without great danger of spreading the infection. In this connection S. W. Foster states, and Mr. Reed corroborates his statement, that he has found it is advisable when spraying pears for the control of codling moth to add 4-4-50 Bordeaux to the codling moth spray. This is powerful enough to disinfect the wounds on the tree and to insure against the potency of any of the bacteria in the exudate which the spray washes off and spreads over the remainder of the tree.

The blight is spread by insects, particularly bees, ants, aphis and thrips. It can also be spread very easily by the hands of the blight men. Tools, and even the hands of the men working in the blight, should be disinfected and the additional precaution taken of disinfecting every cut made. This precaution should be religiously exercised. For this we have found a mixture of mercury bichloride and mercury cyanide, mixed to a strength of about 1 to 500 of mercury and 1 to 1,000 each of bichloride and cyanide, to be the best. The cyanide is best for disinfecting the wounds and the chloride for the tools. The mixture thus handles both. Mr. Reed sometimes uses straight Bordeaux paste for disinfecting his cuts. This material, due to its intense blue color, gives the added advantage of showing conclusively that every cut has been disinfected. When aphis are abundant you will always find the ants which are on the job milking the aphis. The aphis punctures the small twigs and leaves on which they feed, and the ants which feed on the wet exudate of the blight, moving over these small punctures made by the aphis, leave a blight infection behind. A small drop of exudate will also start an infection when it drops on aphis punctured twigs. It is found to be good policy to spray for the control of aphis and thrips. It might almost be said that it is best to spray for them whether they are present or not, as here again the spray material, which in this case, if B. L. 40, kills most of the other insects present and as well acts as a repellent to the bees.

As mentioned above, the blight travels fastest during warm, muggy conditions, particularly if these are preceded by heavy winds. During hot dry weather the blight slows up and in most of the small twigs is killed.

The blight travels through the phloem layers of the bark, rather than through the cambium. By careful observation this year we find that early in the season the blight travels on the outside of the phloem layer; that is, in the young trees, just under the outer bark. As the season progresses the blight recedes into the bark and travels almost in the cambium layer. Later in the fall again it seems to come closer to the surface.

As the blight does not always travel in a definite line the operators have to use very great care in watching for the long, fine hair-like lines, indicating the extension of the blight infection farther up the limbs than is apparent on the surface of the bark. This one factor is perhaps the most important one to be borne in mind by anyone working with it, and it shows that it is absolutely necessary to give the blight credit for traveling much farther than is apparent. It is of the utmost importance to cut well above and below any infection.

Do not attempt to save small limbs unless they are heavily laden with fruit, and above all things do not leave stubs of any kind. Make all cuts smooth and take care not to injure the bark in any way around the cuts, as injuries and bad stubs will allow new infection to be easily started by insects and other agencies.

None of the so-called "blight cures" are of any use.

The blight travels faster down the limbs than up the limbs, apparently moving with the sap. When the sap is moving rapidly the blight does likewise.

It must always be borne in mind that when blight material is thrown on the moist ground the blight continues to travel in the wood and exudes gum which causes it to remain an active factor in the distribution of blight. All brush should be removed or burned immediately. Care must be exercised in cultivation when any blight material is on the ground, as the cultivator teeth, after running through or scratching any blighted brush or roots, will spread the infection nine times out of ten to the roots of any other tree which it scratches.

Never climb in the trees, but use a ladder, for the injuries done to the bark offer opening for any drops of blight exudate to start new infections.

The new method of handling consists in the removal of the cortical layers of the bark over the infected area and from eight inches to one foot on either side of the infection. If this work is done carefully with a knife or with some of the other prepared tools, which are now on the market, the cambium, which does not become infected with blight until the case is well advanced, will not be injured. When the cuts are all disinfected with the material noted above the cambium will then proceed to grow and heal over the wound. We have found it is best to keep the bark, the treated surface and all tools well wet with disinfectant throughout the operation. This because of the fact that bark when wet shows the infected areas a great deal more distinctly and also because if the cut is not kept moistened during the treatment of a large infection the treated surface tends to seal over and the disinfectant does not penetrate as well as it does when the surface is kept moist throughout the operation.

The crotches of the tree should be cut to the cambium for they are the hardest of all to treat, and plenty of sap will flow through the outside of the limbs to keep the tree growing and heal over the entire wound.

Very careful work must be done in scraping at the crown of the tree. The bark is very thin at this point and in most cases very hard, and if very careful work is not done in the removal of the cortical layer there the operator's knife or other tools will slip and cut through to the cambium. Places which are deeply cut, such as this, will dry out and the wound will not heal. Care must be exercised in not scraping too deep. Only a very thin layer of cortical cells should be removed.

When the infection travels into the roots it is also possible to save the tree by this method, but the work must be exceptionally carefully performed, as the bark on the roots is very thin and delicate. The smaller infected roots should be removed immediately, preferably with a gouge chisel, and all of the crevices in the crown of the tree should be carefully cleaned out to the cambium layer with the same tool. When the infection travels under the crown of the tree we have found the use of a small blow torch very effective in handling this work. As 126 degrees Fahrenheit will kill blight bacteria, and as the under side of the crown can be sacrificed without permanent injury to the tree, we have used a torch and heated that part of the tree sufficiently to kill all possible infection.

In our work we have found it best to run a small advance crew. These men only work on the infections on the main limbs, trunks and roots, and as they move more rapidly than our main clean up crew, they catch most of the infections on our main trees before they travel far and do much damage. Behind our main clean-up crew, we run our inspectors. These men treat all of the comebacks before they travel and do much damage. The comeback cases are the hardest to handle and do the most damage, for where limbs have already been treated it is necessary to remove the bark to the cambium, as the remaining bark is very hard and thin and cannot be scraped without injury to the cambium. No matter how carefully the work is done there is sure to be a small percentage of comeback cases. Some operators have attempted to stop the occurrence of comeback cases in treated trees by increasing the strength of the disinfecting solution and by scraping deeper into the bark, but both these methods are injurious to the cambium and generally kill this layer. It is far better to admit that a few comebacks are certain to appear and to govern your work to handle them as quickly as they make their presence known; this they do by exuding a small white glistening drop which later turns to a reddish brown color.

In the past pear growers have checked the travel of the blight in their trees by stopping all cultivation, irrigation, etc., but it is a question whether or not this practice pays. One large orchard nearby was treated in this manner this year but the blight did not stop traveling much sooner than in our own. When the first fall rains came the sap in the trees started to move very rapidly and the few holdover cases became so active that very soon the infection was as bad as before. Added to this, the trees did not make as large a growth as they did in the well cared for orchards, and so they are really a year behind.

Blight control measures should be practiced throughout the summer and well on into the fall to insure that absolutely no holdover cankers are left. The pruners cutting through these will spread the blight, also the blight in the cankers will become active the next spring and will be there for the insects and other agencies to spread and start new infections. The removal of all holdover cases before spring is the most important practice in the control of blight, for if no blight is left in the plantings and all neighboring plantings are in the same shape, the chances of having blight the next year are less than one in a hundred.

THE CITRUS CROP

The citrus crop is the most important one in Sicily. It consists principally of lemons, oranges, both sweet and bitter, and mandarins. The United States is the most important market for Sicilian lemons, but for some time there have been practically no shipments of oranges to that country, as the American market is now largely supplied by California and Florida. According to customs statistics 59,091 tons of lemons were exported from Palermo in 1919; 32,602 tons going to the United States, 11,896 to Great Britain, 10,437 to Switzerland, 879 to Holland, 401 to Belgium, 389 to Tunis, 311 to Denmark, 189 to Germany, 132 to Austria Hungary, 31 to Turkey and 17 tons to Australia. Exports of oranges were 7,431 tons, of which France took 3,303, Great Britain 2,256, Switzerland 1,474, Belgium 160, Holland 108, Denmark 64, and other countries smaller amounts.

The 1919 lemon crop was considerably smaller than that of 1918 except the "verdellis." Throughout 1919 local producers held out for high prices which enabled them to pay the increased labor and irrigation charges and still make handsome profits. The exporters had a very unsuccessful year. The prices for lemons in the American market were very weak, except in August and September when reasonable gains were realized.

It has been estimated that about 25 per cent of the lemon crop is used in the manufacture of by-products. From the standpoint of production the year was a very successful one. The demand for citrate of lime, concentrated lemon juice, citric acid, tartaric acid, etc., was very large. The citrate of lime, which is the juice of lemon preserved in lime, was all bought up by the Camera Agrumaria and resold by them. In this manner it was possible to maintain prices and bring forward surplus stock which was reduced to about 16.000 tons at the end of the year. There are only two Italian factories producing citric acid—one in Casale, in northern Italy, and the other in Palermo.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The snowclad mountains in the background with laden orange trees in the foreground, shown on the cover, also the great cornucopia pouring out its wealth of golden fruit give advance announcement of the coming of the eleventh National Orange Show to be held in San Bernardino, February 18-28. This has become one of California's regular annual festivals, and in more recent years there has been connected with it a citrus institute which makes it a practical cultural educational opportunity as well. San Bernardino already has the tents pitched and many of the details worked out for this great event.

* * *

Nevada sheep manure was formerly shipped into California orange orchards at about $7.15 per ton. Touay it costs, or would cost if it came, $12.15. It doesn't come and California orchards are less productive.

* * *

The railways have announced "For the first time in years there is a surplus of freight cars." Several reasons are given, but the one which we believe is the true one is not given, and that is prohibitive freight tariff. Many cars of Imperial Valley grown lettuce rotted or were plowed under because it was impossible to ship East and secure sufficient to cover the cost of packing and the excessively high freight rate. California fruits are now going to Atlantic seaboard points by water. It is not as attractive a method of shipping as by rail, but growers wish to get something for their fruit besides packing expense and the excessive rate paid to the railroads.

* * *

The first of these ships to carry California oranges and lemons was the Charles H. Cramp, which left Los Angeles harbor January 12 and reached Philadelphia in about 15 days with fruit in good condition, in fact, the percentage of decay was even lower than is usually shown in railway shipments.

* * *

In January California shipped to Japan a million and a half pounds of cotton and to Liverpool over a million pounds. There are still several thousand bales awaiting orders from American and foreign manufacturers. This state produced during the last season 152,636 bales. Arizona produced 105,200 bales. Neither state has finished its harvest for the labor and the financial situation has been such that harvesting has been slow and, in fact, the entire 1920 crop will never be harvested.

* * *

The cotton production of 1920 called for the planting in California of 287,500 acres, and of 225,000 in Arizona. It is too early to predict next season's planting, but one guess which may prove fairly close is that it will be at least 25 per cent under that of last year.

COLLEGE OF AGRICULTURE CONFERENCE AT SACRAMENTO

California prides itself on its great state university. In the matter of attendance it is the greatest institution in the world. Its college of agriculure is not fully up to the standard of many of the other branches of the institution, though it is so infinitely beyond its position of a score of years ago that its management and the producers of the state have felt pride in its growth. But today both those within the institution and responsible for its management and the farmers generally over the state are asking for extension and improvement in all its activities, and many questions have come up.

"Shall it remain a part of and intimately connected with the great university at Berkeley or shall it be transferred to Davis or some other agricultural section with acreage sufficient to give practical as well as academic opportunity?" or "Shall the main institution remain in Berkeley with one northern branch at Davis which shall give opportunity for freshman and sophomore years, with theoretical and research work continued at Berkeley the two final years of the course and beside the northern branch at Davis, other branches ultimately to be located in other portions of the state?" These are only slight indications of the great number of questions which are coming up at this time which seems to be a crucial one in the life of the institution.

The state legislature has before it at this moment measures which concern the institution, and many well wishers of agriculture in California have innumerable suggestions, so a meeting has been called by the joint agricultural committee, to be held at Sacramento on the evening of February 25. The purpose of the meeting is to ascertain "the views of the agricultural interests of California as to the needs of and the proper steps for developing an efficient college of agriculture. All who may have views of a constructive nature are urged to be present and make their views public."

This meeting is one of the most important ever called in this state. We must have a strong college, and it is up to the farm interests to say what kind of college they want.

REDIMADE

HOUSES and GARAGES

Built in our Los Angeles Factory. Delivered in BUILT 4-foot sections complete with doors, windows, roofing, etc., all ready to assemble and finish in one to five days, depending on size.

Many Plans—One to Five Rooms

We will erect at a nominal charge within 50 miles of factory.

Direct from Forest to You at Lowest Cost

We buy our lumber direct from the mills of the heart of the great Oregon timber country through our main factory at Portland, ship it direct to Los Angeles and by our modern methods and power machinery convert it into attractive permanent houses and garages at a wonderful saving over all other methods. Complete information is free for the asking.

See us first for bungalows, beach cottages, camps, garages, ranch help houses, etc.

Our low prices will surprise you.

D. M. S. LIME

(Decomposed Marine Shell)

Nature's Own Soil Tonic

Odorless Soluble 99.96% Pure

Lime is one of ten necessary elements in successful crop production. Applied to soil inclined to pack, it has the power of shrinking clay, making it more pervious to water and making cultivation easier.

Lime materials make "sour" soils "sweet." They change an acid soil condition to a slightly alkaline one. ACIDITY of soils is very detrimental to crop growth. A slightly alkaline condition which may be obtained through the use of lime is ideal for crops.

Lime materials are necessary for useful and beneficial bacteria and other microorganisms of the soil. They also promote the normal decay of soil organic matter through their effects on the agencies of decay.

Through ancient, mediaeval and modern research, decomposed shell lime stands paramount as the one Soil Tonic agreed upon by all expert Agriculturists.

Decomposed Marine Shell Lime

For bacteria development, acidity correction, odorless soil sweetener it has no equal, whether it be for fruit, nuts, flowers, vegetables or lawns.

SIZE—QUALITY—VALUE

Of your crop is determined by the proper liming of your soil.

Every person attending the San Bernardino National Orange Show, February 18th to 28th, may, by mentioning this invitation in California Cultivator, receive absolutely free a package of D. M. S. Lime Fertilizer. Booths 8 and 9 from main entrance on car line.

Order through your nearest dealer, and be sure to specify D. M. S. LIME and you will be sure of the product. Exchange Members supplied through the Fruit Growers Supply Company.

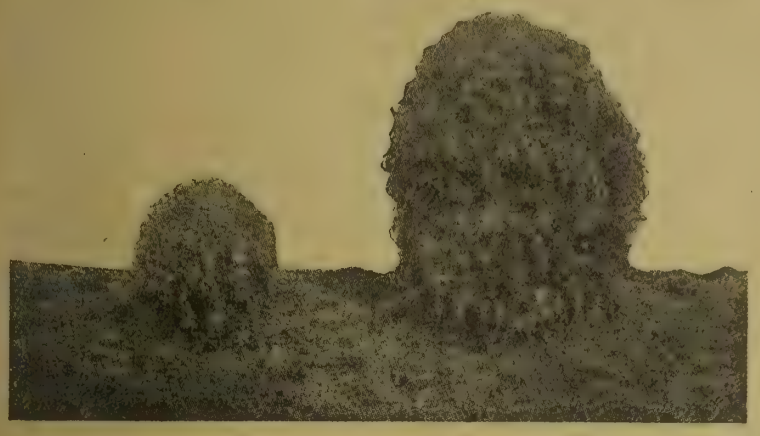
Increased Crop Production

Follows the Use of AGRI GYPSUM

Highly beneficial results at small expense may always reasonably be expected. Citrus crops, Hay, Grain, Truck and other crops of heavy plant growths require large amounts of the elements found in AGRI GYPSUM



Pile on left shows Alfalfa from plot not treated; pile on right, Alfalfa from same size plot treated with 200 lbs. of gypsum to the acre. Photograph loaned by Professor Olson of the State Experiment Station of the State of Washington.

IT IS AN ESTABLISHED FACT that such crops as oranges, alfalfa, barley, oats, potatoes, hay crops, cover, truck and other similar crops, with heavy foliage, require LARGE AMOUNTS OF THE ELEMENTS CONTAINED IN AGRI GYPSUM. As a rule our soils are deficient in these elements but it is easy and economical to supply them.

The qualities of AGRI GYPSUM may be summed up as—

First—A most beneficial fertilizer.

Second AGRI GYPSUM releases, by its chemical action upon other elements already in the soil, Potash, Phosphorus, and Nitrogen—all essential to the successful growth of crops. Much land is low in productivity because the Plant Food is not available. AGRI GYPSUM will make your soil fertility easily available.

Third— Crops such as alfalfa, given AGRI GYPSUM, will invariably contain more sulphur and nitrogen; will have more leaves, better color and otherwise make a better appearance, THEREBY BRINGING A BETTER PRICE IN ADDITION TO BEING A HEAVIER AND BETTER CROP.

Fourth—AGRI GYPSUM loosens the soil when it is inclined to pack and rounds out its culture and preparation.

Fifth—Soils treated with AGRI GYPSUM hold moisture better than soils deficient in Calcium Sulphate.

Sixth—Soils pregnant with black alkali are neutralized, reducing if not entirely rendering the alkali harmless, depending upon the amount of alkali and the amount of AGRI GYPSUM used.

You can tell any field where AGRI GYPSUM has been used. The plant growth tells the story. Many recent experiments by recognized authorities show almost amazing increases in crop production.

Considering costs of nitrates, phosphates and other crop producing elements, you can save money by alternating fertilizer with AGRI GYPSUM and obtain equally good, if not better, results at a saving to you and benefit to your land.

Gypsum contains two of ten essential elements for plant nutrition,—calcium and sulphur, and also serves to release other elements. It is not new. It was introduced in Europe in 1768. Benjamin Franklin was the first to advocate its use in America, and soil experts everywhere advocate its use in the production of the principal crops.

Read What Users of AGRI GYPSUM Have to Say About Results

Lindsay, Calif., Feb. 5th, 1921.

United States Gypsum Company,
Los Angeles, Calif.
Dear Sirs:—

In reply to your inquiry, I have been well satisfied with the results obtained in my orange grove through the use of your AGRI GYPSUM. I have made two applications of one ton to the acre, one in 1918 and one in 1920, putting it on in May or June and working into the soil with cultivator. It has put the soil in perfect mechanical condition where it used to cement together and I find it possible to put the cultivator down much deeper with no more power than formerly.

Yours truly,

BASIL PRIOR.

Rivera, Calif., February 7th, 1921.

United States Gypsum Co.,
Los Angeles, Calif.

Dear Sirs:—

In reply to your inquiry, will say the result of your AGRI GYPSUM was no surprise to me as I have used it for several years. A large crop of oranges, and the soil was very hard before using. It has mellowed it up in good shape and takes water easily. The cover crop on the land where Gypsum was used is from 3-6 tons heavier per acre.

Yours truly,

WM. SEX.

FREE SOIL ANALYSIS

For determining the amount of alkali in soils, we will make a free chemical analysis, advising the correct amount of AGRI GYPSUM to apply.

AGRI GYPSUM applied to citrus makes all the soil fertility available to the plant growth. It supplies the elements that invigorate the growth of cover crops, increasing the accumulation of nitrogen on the roots.

Ask your Dealer for AGRI GYPSUM and you will be sure of the product ground fine to do the most good with the least amount used. If your Dealer cannot supply you, write

California Fruits

A WONDERFULLY interesting report of the conditions of last year's fruit production is to be found in "California's Crop Report 1920," made by Leon M. Estabrook, chief of the bureau of crop estimates, U. S. A., G. H. Hecke of the state department of agriculture and E. E. Kaufman of the California cooperative crop reporting service. We have quoted its tables and some of its findings as to several crops. Here is its comment on the fruit situation.

Apples

The commercial or boxed apple crop of 1920 is estimated at 3,000,000 boxes out of a total crop of about 6,003,000 bushels or boxes. Watsonville packed about 2,250,000 boxes, Sonoma County 500,000 boxes, and the balance of the state 250,000 boxes. Adverse weather conditions were experienced at blossom time; high temperatures caused a little sunburn and doubtless drouth conditions affected the size of individual fruits. The percentage of first grade fruit was smaller than in 1919, and the extremely low price of dried apples cut the tonnage sent to the evaporators to less than 50 per cent of the previous year. In some instances the cost of moving from the orchards was greater than the price received at the drier, and the fruit was left to rot under the trees. The production of dried apples is roughly estimated at about 5,000 tons. Reports indicated a greater production than usual of cider and vinegar.

Carlot shipments to date, in comparison with last year, as reported by the bureau of markets, would indicate a decided decrease in the quantity of California apples in storage.

Peaches

The 1920 peach crop was affected more or less by the long continued drouth and the big crop of the previous year. Sutter County came back strong, and with older and new bearing trees produced approximately 40,000 tons of canning peaches. Shipping peaches from Placer County and other sections held up well. New plantings of peaches of the drying varieties have not kept pace with the old and torn out orchards, and the decrease in acreage is reflected to some extent in the decrease in the production of dried peaches. Last year some 34,000 tons of dried peaches was produced, while the estimate this year is for only about 25,000 tons. Out of the state shipments in 1918 were 3,137 cars; 2,774 cars in 1919; and 3,107 cars in 1920. Prices were better than last year, canning peaches being from $10 to $30 higher, with a small increase over 1919 to the grower of dried peaches. A fair estimate of the average price to the grower for all varieties would appear to be about $76 per ton.

Peach production in the United States was estimated at 43,697,000 bushels, equivalent to about 1,092,425 tons. California's production was about 14,800,000 bushels, equivalent to 345,000 tons, or 32.5 per cent of the total production of the entire United States.

Pears

Out of the state shipments of pears this year amounted to 4,377 cars; last year, 4,248 cars; and 4,572 cars in 1918. The tonnage of dried pears is estimated at less than half of last year or about 2,500 tons. The tonnage going to the canneries was about 75 per cent of 1919, which with the estimate for home consumption, makes the total production about 90,000 tons. Prices paid the growers this year for canning stock averaged $15 a ton higher than in 1919. Shipping stock sold at higher prices also, and a fair average to the grower for the 1920 crop would be about $90 a ton.

The total production in the United States was estimated at 17,279,000 bushels, of which 20.8 per cent was credited to California.

Apricots

Adverse weather conditions at blossom time, followed by brown rot and shot-hole fungus, played havoc with the "cot" crop, which was only 65.7 per cent of the 1919 crop and the smallest since 1916 notwithstanding the large increase in new bearing acreage the last few years. The production of dried apricots will probably not exceed 10,000 tons. Shipments fresh were 312 cars against 420 cars last year and 441 cars in 1918.

Prunes

The prune crop suffered from both drouth and adverse weather conditions at blossom time. With some increase in new bearing acreage and older trees in new prune growing districts, the production dropped to 73.1 per cent of last year when the crop was estimated at 130,000 tons. The crop was very spotted, some orchards carrying a full load while across the road or over the fence only half a crop was evident.

Cherries

This crop came very near to being a bumper. Out of the state shipments jumped from 356 and 335 cars in 1918 and 1919 respectively to 494 cars for 1920. Light rains in the midst of the harvest caused more or less cracking of the fruit, and the consequent development of mold resulted in some damage.

Plums

Out of the state shipments in 1920 amounted to 2,534 cars compared to 2,918 cars in 1919. The plum crop really got away to a bad start in the spring. Two days of excessively high

The Growth of Co-operative Canning

The present movement to bring the tremendous force of Co-operative effort to the canning fruit industry had its modest beginning seven years ago in Tulare County. Its growth during these seven years is best shown by the following figures.

Year	Canneries Operated	Cases Packed	Approximate Value
1914	1	65,000	$ 190,000.00
1915	3	72,000	216,350.00
1916	3	101,500	329,500.00
1917	3	313,929	1,569,645.00
1918	5	319,000	1,470,000.00
1919	7	673,365	3,870,426.00
1920 (Estd.)	10	965,633	5,869,424.00

At the present time the ten canneries, five in Southern California and five in the Santa Clara and San Joaquin Valleys, can less than 10 per cent of the pack of the State. Yet they have wielded a tremendous influence on fruit prices obtained by the growers in all sections of the State.

Now the time has come when the growers should take hold of this business and make their own organization the dominant factor of the Canning Industry.

Only in this way can the necessary expansion of domestic and world markets be obtained. Only in this way can the prices of our canning fruits be stabilized and the values of our orchards maintained.

The present situation of the canneries of the state is one of demoralization. Disaster faces this, the greatest of California's fruit industries.

It is you, Mr. Fruit Grower, and you alone who can save the situation by your united support of our effort to provide the necessary manufacturing facilities and marketing outlets for your fruit.

Write at once for full information to Box G, SAN JOSE, CALIF.

Why Increased Taxes?

Every citizen of California is a taxpayer.

Taxation is, therefore, YOUR concern.

You pay direct on property, or you pay indirect taxes through transportation, light and power costs, in interest rates, or in the cost of merchandise and rent.

So you want answers to these two questions:

1—How much money is actually needed by the State, with proper economy, and Why?

2—How shall this money be raised, and Why?

What the Tax Investigation and Economy League IS

Three hundred thousand of our people, security holders in public utilities, banks and other companies taxed for state purposes, together with an equal number of employees of these companies, are represented by the Tax Investigation & Economy League, which has been organized to learn and make public the facts about the actual needs of the State government.

NON-PARTISAN and NON-POLITICAL, this league invites the cooperation of every citizen.

Such Facts as These Are Pertinent

Governor Johnson's 1915 budget for two years called for $36,000,000
Governor Stephens' 1919 budget " " " called for $47,000,000
Governor Stephens' 1921 budget for two years calls for $81,000,000

— An increase of $45,000,000 over the budget of six years ago —
— An increase of $34,000,000 over the budget of two years ago —
— An increase of $15,000,000 over the budget of two years ago even after we allow for all the appropriations and expenditures authorized by the people at the November Elections.

It Is Time for Economy

For all of us the era of extravagance should be ended. That our present state organization costs too much and is full of unnecessary duplications and unnecessary expenses, is agreed by state officials and the public alike.

We ought to know, and we want to know now, how much money is being wasted. We ought to know whether the new demands on our pocketbooks are necessary demands.

No Ad Valorem Tax

One thing is already sure. If the $15,000,000 now asked, in addition to the money voted last November is saved to the public,

—Our existing revenue will pay all our bills—we will have a surplus in the treasury two years hence—there will be no ad valorem tax.

The legislature is the authority that shall determine how much money shall be raised, and what rates of taxation are fair.

It is the privilege and duty of every citizen who has facts to present, and conclusions based on these facts, to assist his representatives in reaching a just decision.

You will be kept advised of the results of our investigation. Your own views and conclusions are respectfully invited

Tax Investigation and Economy League

1504 Humboldt Bank Building, San Francisco

"The Power to Tax is the Power to Destroy"

Here's a Tractor for the Western Farmer

Western farmers need a Western tractor. In other words, they need a Stockton. For the Stockton was designed by men who *knew conditions,* and whether it be plowing under a cover-crop, pulling a disc, or filling a silo, the Stockton takes *all* the short cuts to cheaper production and longer profits.

Because soil conditions differ, two types are built, the SURE-GRIP tracklayer, and the OPEN-WHEEL type. Both are low and narrow, to work close to trees and vines and to operate between close set rows in orchards and vineyards. Both turn short, pull hard, *speed-up* farm tasks.

Both have Herschell-Spillman motors, Berling Magnetos, Hyatt roller bearings, and Kingston one adjustment carburetors. Our folder describes their mechanical features in detail. Let us send this to you, and tell you the name of our dealer near you who will arrange for you to see these tractors in actual operation. Write today and ask for folder D.

temperatures the latter half of June caused a probable damage of ten per cent to the plum crop.

Oranges

It looks like the 1920-21 orange crop will be the second largest in the history of the state, the 1916-17 crop carrying off first honors.

The orange crop is one of the most difficult to estimate because at the time when such estimates must be prepared only from two to three per cent of the crop has been harvested. Valencias will not be picked for four or five months and are barely half grown. The December 1 estimate is nothing more than a forecast of probable production, and should be called the preliminary estimate, leaving the final until about May 1 of the following year when the Valencia harvest has been fairly started.

For the 1920-21 crop the California cooperative crop reporting service makes a preliminary estimate of 18,700,000 boxes compared to a revised estimate of production last year of 15,075,000 boxes. Shipments the past year, that is November 1, 1919, to October 31, 1920, were 35,547 cars of which at least 2,000 cars were Valencias carried over from the previous year, thus leaving total shipments of the 1919-20 crop at about 33,500 cars or 15,075,000 boxes. The Navel crop of the present year was reported of excellent quality, but in some districts running to small sizes and small sizes would tend to reduce the number of packed boxes.

Grapefruit is included in the foregoing estimate of oranges, and will probably amount to about 325,000 boxes.

Lemons

Shipments of lemons of the 1919-20 crop showed a production of about 3,900,000 boxes. All reports indicate a larger crop for 1920-21. Unless some improvement can be brought about in market conditions, it is doubtful if the present crop will all be harvested as many growers will be unable to sell their lemons for enough to pay the packing and transportation charges, to say nothing of the cost of growing.

Grapes

First reports of the season indicated the grape crop would be equal to or better than in 1919. As the season advanced, however, and the effect of the severe drouth of previous years became more apparent, a decline in condition was generally noted. Two days of exceedingly high temperatures the latter half of June, followed by a similar experience in July, cut down the raisin crop a possible 25 per cent from early expectations. The average yield of raisins per acre was estimated at about 1,900 pounds and the area harvested at 190,000 acres, making the estimated total production 180,000 tons. The new bearing acreage of raisins is largely confined to Thompsons, and the production of this variety in comparison with the total crop shows an increased percentage over former years.

The total grape shipments the present year, as reported by the transportation companies, amounted to about 26,100 cars, of which 24,065 were from north of the Tehachapi. Just what proportion of this total was table grapes it is impossible to say, but a reasonable estimate would appear to be about 50 per cent, or in other words 13,000 cars of table grapes found their way outside of the state the past year. On the basis of an average of 12 tons per car and the consumption within the state, the table grape crop was estimated to have been 160,000 tons. Inquiry developed that a fair average price received for these grapes was about $2,300 per car. Price to the grower would be considerably less as investigation showed there would be a charge for packing, loading, transportation, icing and selling of about $1.35 per crate which on the average loading of 1,000 crates per car would amount to $1,350, leaving the average price to the grower but little better than $900 per car or approximately $75 per ton.

An estimate of the production of wine grapes is still more difficult under present conditions. All reports indicated a slight decrease in comparison with the previous year. Reports as to the disposition of the crop of 1919 indicated a production of about 400,000 tons. Placing this year's

total production at 95 per cent of the crop in 1919 was directly in line with the reports of correspondents and others interested in wine grapes. A price of $65 per ton on the average may seem rather low when one thinks of the sales reported at $150 per ton or better, but it must be remembered that it is an average price to the grower which we are seeking and that the 30,000 or 40,000 tons of cull table grapes used for crushing brought a very low average and will tend to offset the extremely high prices received for certain varieties of wine grapes.

Figs

The fig crop is another one that is very hard to estimate at the present time. Planting of figs has been exceedingly heavy the past few years, but so far production does not indicate any increase in bearing acreage. It would not be surprising if it was necessary to revise this estimate upward.

Olives

No very satisfactory data are available regarding olive production although monthly reports on condition and a final estimate of production compared with a normal have been made for the past decade. The crop has become of sufficient importance to warrant more complete reports, and a determined drive among olive growers will be made next year to put the olive crop on the map and give it the attention rightly deserved.

Reports the past season showed rather a poor crop in the South, fair to good in the North, and a total production of about 65 per cent of a normal. What is a normal production in tons? Who can answer?

Walnuts

A revised estimate of the walnut crop of 1919 brings the total production up to 28,100 tons, or about five per cent greater than the December 1, 1919, estimate. Notwithstanding new bearing and older trees, this year's crop showed a decrease of nearly 7,000 tons. A larger percentage than usual of walnuts was put through the cracking machines of the Growers Association.

Almonds

Adverse weather conditions at blossom time and the drouth had more or less influence on the production of almonds the past year. Conditions were very spotted, some counties reporting practically a normal crop while in others not over 20 per cent of a normal crop was harvested. A final check on production in 1919 indicated a crop of about 7,000 tons. Production this year was hardly 80 per cent of the 1919 crop, or about 5,500 tons.

Other Fruits

Avocados, dates, pomegranates and persimmons are gradually increasing in production, and add many thousands of dollars to the enormous value of California's fruits.

Strawberries, blackberries, raspberries and loganberries are important crops in certain localities, and their value easily runs to more than a million dollars to the growers.

Nursery products have long held an important place in the horticultural wealth of the state, and the past year has undoubtedly shown a comfortable increase in the value of the output of the nurseryman and florist.

NATIONAL TRACTOR SHOW

The National Tractor Show, one of the two to be held during 1921, closes on Saturday of this week at Columbus, Ohio. Trucks and farm implements are also admitted and space has been demanded by exhibitors in excess of any possibility of furnishing. The attendance of farmers from all portions of the Middle West has been very large.

SAN QUENTIN GRAIN BAGS

The price of San Quentin grain bags has been fixed at seven and a half cents each, and this price will remain in effect until April 1, 1921.

The California Cooperative Canneries is conducting a state wide campaign for new members.

BEST TRACKLAYER SIXTY PULLING THREE GANGS OF STOCKTON PLOWS 10 INCHES DEEP

Tell Us How Much You Have to Plow

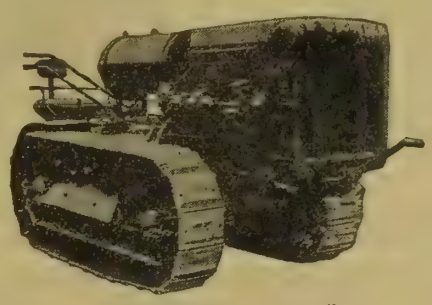
Whether you need a Best Tracklayer *Sixty* or a Best Tracklayer *Thirty*, depends upon the size of your farm and the nature of your work.

Give us the details and we will show you how you can use economically one of the famous Best Tracklayer Tractors for your plowing, cultivating, harvesting, hauling, etc.

There's no need to tell you of the many years of successful performance back of the Best line. There's no need to tell you of what the Best line—developed on the Pacific Coast—has done for the Pacific Coast farmer.

Interesting as this is, it is ancient history to you, What you want to know is "How can I adopt the Best way to my farming problems?"

That is the question we want to help answer for you. There's no better time than the present in which to put the Best Tracklayer to the test. Plowing time is here and plowing must be started at once and completed promptly. You need Best dependability and stamina and low operating cost, and you need a tractor that will go unimpeded over soft, loose or rough ground.



TRACKLAYER "THIRTY"

Let us tell you all about the points that have made Best Tracklayer reputation, and give you the name and address of our nearest dealer where you can see the Tracklayer. Now is the time.

C. L. Best Tractor Co.
San Leandro, - California

BEST TRACKLAYER TRACTORS

Dependable Trees
FROM OREGON

We solicit your inquiries for any Fruit trees you may need for Spring planting. We have a limited number of especially nice trees of

Yellow Belleflower, Delicious, Jonathan, McIntosh Red, Newtown Pippin, Northern Spy, Rome Beauty, Winter Banana and other apples.
Bartlett, Bosc, Anjou, Comice, B. Hardy, and other pears.
French and other prunes.
Muir, Lovell, Elberta and Tuscan peaches in small grades.
Small Fruits, Shade Trees and a splendid assortment of Shrubbery.

We have served planters of California for many, many years; Orenco Trees are planted by the tens of thousands in your state and many planters will use none other. Shipments will be made promptly and you will, we are confident, be highly satisfied. Address

Processing Citron

In response to many requests we are reprinting directions for preparing the regular "citron of commerce," as given in former Cultivator:

In preparing citron for preserving it is halved, put in brine for three weeks, and said brine must be strong enough to bear the weight of an egg the entire time the citron is in it. By keeping up the proper strength of the brine, the citron can be kept in storage until necessary to use it, being kept this way many months.

You can not depulp the citron raw, as the fiber between pulp and rind is too strong. The citron is boiled in water from 45 minutes to an hour, which boiling loosens up the pulp so it can be easily removed with a spoon. The boiling also brings out the salt in the fruit and after it is dipped in two washings of cold water all salt should have been removed.

Now the citron is ready for taking up the syrups. Since the citron has already been boiled in only water for about one hour, its texture is softened up so that syrups can soak through it evenly. A syrup can be prepared thick as honey and the citron boiled in it (do not put into the syrup more than one-half its weight of citron—into 100 pounds of syrup put only 50 pounds of citron), the water in the citron will dilute the strength of the syrup. Hence the water of the citron must pass off as steam during the cooking and at the end of one hour the syrup should be just as dense as at the start. Now the citron can be removed with its syrup and both allowed to stand for nearly a week in some vessel.

At the end of the first week the cook will find that the strength of the syrup has greatly decreased. Now the syrup should be brought to its proper strength and the citron cooked in it a second time.

Each time the citron is removed from the vessel in which it is cooked to the vessel it is to stand in, the syrup should be of proper strength. This recooking should take place as often as the syrup is found below the standard in strength. When the syrup has become constant in density, the citron can be kept stored this way at the desire of the cook as long as the syrup covers the fruit, though it is exposed to the air. Dense syrups are preservatives, but weak ones invite fermentation.

Citron should cure up in the syrup for at least four weeks. After this time the syrup should be drained from it and the fruit allowed to dry upon trays in a dry place away from the sun and the bees. It will take from five to seven days for the fruit to dry.

When it is dried, it is dipped into a crystallizing syrup made from pure cane sugar. This syrup is prepared by dissolving sugar in boiling water until you get a super saturated solution—allow the syrup to stand for five hours when a crust of sugar will be formed upon the top—remove the crust and dip the fruit well. Next lay the fruit upon clean trays and after 24 hours standing a nice crystallization of sugar will cover the fruit. At last the fruit is ready for boxing for shipment.

Prepare your syrups used for cooking three-fifths glucose and two-fifths cane sugar. Cooked in clear glucose the flavor is lost and fruit is too tough. Cooked in straight sugar syrup after standing awhile the sugar crystallizes in it, and transparent condition is lost and fruit becomes brittle.

Orange and lemon peel can be candied according to the same process.

Increase the Duty of Water

By A Practical Irrigator

IN each locality methods may be worked out that are satisfactory for the kind of crop raised, the texture of the soil and the degree of the slope. The various combinations of these three variables differ so that it is impossible to lay down set rules that will apply.

With the development of new territory, due to the very fact that the conditions of each tract of land are variable, it takes keen judgment to design a system to attain the best results, and any suggestions that the contractors may offer are well worth while.

Before going ahead with this subject let us define an "Ideal Furrow Irrigation."

To wet the surface, or just under the surface, of the entire field to an even depth without the following injurious effects: without loss of water; without eroding the soil; without an undue amount of leaching of fertilizer.

First, without loss of water: In running excessive amounts of water off the lower end of a field, a great deal of valuable humus is lost, besides the waste of water.

Second, without eroding the soil: The principal erosion occurs at the upper end, washing out the best parts of the soil, and thereby lessening the yield of the crops. In case of orchards at the upper end the tree rows are soon left on a high ridge, and this soil is deposited at the lower end. In orange groves the lower end suffers the most as gum disease soon sets in, and often kills the trees.

Third, without an undue amount of leaching of fertilizer: Few people appreciate the amount of humus and other salts lost by being dissolved in irrigation or rainwater and carried down below the reach of trees or field crops. Of course, this leaching is most in gravelly or sandy soils. Some writers give the amount of lime alone lost in this way as from one to two tons per acre per year. When we think how insoluble lime is, it is very easy to imagine the loss that must occur of other more soluble salts.

Professor Etcheverry, formerly head of the department of irrigation of the University of California, gives a summary of his experiences. "To decrease the loss by deep percolation the remedy is to divide the field or orchard into short furrows or runs, the length depending on the character of the soil, and to run the water more quickly in the furrows or over the field by using larger heads, especially for porous soils. It is probably safe to assume that the loss due to deep percolation will average no less than 25 per cent of the water delivered to the farm."

In the hillside orchard districts it is much better to lay out the irrigation system first and subdivide the property accordingly. Often the furrows can be run at an angle with the slope with very little grading, thus keeping the grade flatter with less danger of excessive erosion and percolation. In exceptional cases it is better to lay out the rows of the orchards so they can be irrigated on a contour. With a level and a little practice, anybody can learn to stake out orchards in this way and at the same time get the rows located so they will look well and cultivate well. This sort of a system will bring the rows not parallel with one edge of the property and of uneven length. However, in orchard cultivation the tractors and implements used are small, and the extra turning is not an objectionable feature.

Professor Smith, professor of irrigation engineering of the University of Arizona, in a recent bulletin says: "Heavy grading is also objectionable because it may strip the fertile soil from a large part of the field. If water can be run in deep furrows, the land can be graded in the simplest manner by smoothing it and dividing it into a number of plane surfaces, each plane having approximately the same slope given it by nature. This method saves money and saves land. The question involves, therefore, the possibility of irrigating in steep furrows. Can the field be wetted uniformly? The efficiency of irrigation depends upon the uniformity of distribution even more than upon the depth applied. If a large head of water is turned into

each furrow the soil may be washed and eroded, or on a clay soil the water may reach the lower end and have to be turned off before much has been absorbed. If the head is too small and the soil is sandy, the water will be absorbed in the upper part of the field and the lower part will receive little or none. Evidently the head should be the dependent variable. The best quantity to run in each furrow must be determined by trial. Different parts of the same ranch may require different heads."

In regard to length of rows it is a mistake to try to run water too far. Generally speaking, for orchards, the length of furrows should not exceed 330 feet. Heavy soils in which the slope is under three feet per 100 feet offer the best chance for longer runs. In case of young orchards, 660 feet might be permissible, but as the groves get a little older intermediate lines should be installed.

To irrigate successfully it is most important to find effective means of conducting and dividing the water in the head ditch. Of all the systems that have been used the concrete pipe system is the most successful. Good pipe should test 100 to 200 feet internal pressure and should be used with success on main lines with pressures up to 50 feet. However, a system equipped with orchard valves operates most successfully when the pressures are kept below ten feet. When the pressure exceeds this amount cut off gates or overflows should be provided to break the head.

Laterals equipped with stand pipes under pressure should preferably not exceed 1,320 feet in length.

Again quoting Professor Smith: "On account of the complexity of conditions general principles of irrigation are difficult of statement. I believe, however, that discussions such as the above lead to more study of local conditions and to a more scientific and economical distribution of water."

BLACK FLY OF CITRUS

Owing to its continued successful spread the following notes on the tropical citrus pest, Aleurocanthus woglumi, commonly known as the spiny citrus white fly, and in Spanish, Mosca prieta, is herewith reproduced from the U. S. bureau of entomology bulletin.

The black fly (Aleurocanthus woglumi Ashby) is a tropical pest of the Old World that has made its appearance in the tropics of the Americas. Its apparently rapid spread in the New World, along with the fact that it now threatens to gain entrance into Florida from Cuba and Nassau, makes it a pest of special interest from the plant quarantine point of view.

The authors, Dietz and Zetek, say further: "There is perhaps only one way that an insect like Aleurocanthus woglumi can be introduced from an infested region to an uninfested, suitable, far distant one and become established. This is on a well infested host plant, or parts thereof, on which the leaves are allowed to remain so packed that the various stages of the insect can continue their development throughout the journey, or at least withstand it. This is because there are several checks to its successful establishment: first, a high mortality of the individuals, especially in the early instars or at molting time, if subjected to adverse conditions, such as drying out or heavy rains; secondly, the fact that parthenogenesis occurs in Aleurocanthus woglumi just as in other white flies whose life history has been worked out; and, thirdly, the fact that the larvae are not vigorous crawlers and seldom get more than an inch away from the eggs from which they hatch. These factors are considered at length in a discussion of the life history of this insect.

"When Aleurocanthus woglumi is favorably introduced into a new locality, however, there are several ways in which it may spread and become thoroughly established in a region. These methods are the natural and the artificial. The natural method includes: first, the natural flight or migration of the adults from infested to clean plants; second, the carriage of the adults and possibly larvae by winds. The artificial method includes: first, the carrying of infested plants from one place to another, either in the form of pot or specimen plants or in numbers as in the case of nursery stock or as cuttings; second, the carrying of adults on vehicles, trains, automobiles, or the clothes of persons passing or working among infested trees."

THRIVING APPLE SECTION

By Annie Viola Hoge

When the present town of Julian, about 60 miles from San Diego, was founded about 40 years ago, the one thought of its founders was gold, and since that time more than $7,000,000 of the precious metal is said to have been taken from the mines in that vicinity. Gold is no longer produced in any great quantity there, but another and surer means of wealth has been discovered.

Julian is more famous now for its yield of apples and pears than it ever was for its gold, and annually many thousands of dollars are paid growers for their fruit crop. Some of the finest apples and pears grown anywhere in the West are grown in Julian, where the combination of soil, altitude (about 4,000 feet) and general climatic conditions unite to make the firm, highly colored, splendid keeping fruit of wonderful flavor. Irrigation is unnecessary because of the heavy winter rains and fall and summer showers. Destroying frosts have been experienced only about once in 20 years. About 350 acres in the valleys surrounding Julian are planted to apples alone. In the early days many varieties were planted, but most of the orchards have now been worked over to a few standard sorts, and all of the new orchards are being planted with but three or four varieties, so that the output from this section is becoming standardized. King David, Delicious, Grimes Golden, Jonathan and Yellow Newtowns are the principal varieties that have been grown successfully, and the Bartlett, Anjou and Santa Ana pears. The only handicap to Julian apple growers in past years is said to have been lack of good roads. This has been entirely overcome and Julian is in good shape for shipment of fruit by auto truck to San Diego for reshipment by boat and rail.

CROP INSURANCE

Crop producers will find interest in Bulletin No. 912 of the U. S. department of agriculture, "Hail Insurance on Farm Crops in the United States." At present there is no hail insurance company, cooperative or otherwise, in the entire southwest or southeast portion of the county, but in the Middle West, especially Kansas, North Dakota and Iowa, farmers are carrying millions of dollars of hail insurance. North and South Dakota and Nebraska have state hail insurance departments. While this bulletin has no immediate interest for Californians, that is, so far as hail insurance is concerned, there is much of general information for cooperative crop insurance concerns.

The railroad commission has issued to the Southern California Edison Company permission to proceed with program which calls for expenditure of $48,000,000 in the headwaters of the San Joaquin and other central and northern state rivers. The plans call for construction of one tunnel 11 miles in length.

Your Future Income

Foot-hill grown trees are practically immune to crown-gall and diseases common to other localities
Roots such as are grown only on our foot hill soil and location They are Tree Insurance

Your future income in based upon what you do today.

California fruit has paid a greater income on investments than any other industry in the State.

Constructive orchard planting today will, five years hence, repay you each year, profits equal to your original investment.

Five years hence, the present financial readjustments will be forgotten history, but the investment you make today in a producing orchard will insure your financial status then.

The time to plant trees is right now. We are prepared to make immediate deliveries on all orders.

Prunes, Pears, Plums, Clingstone Peaches, Freestone Peaches, Cherries, Apricots, Apples, Almonds, Walnuts, Grapes, Olives.

—all are profitable according to their adaptability to your location.

"I couldn't afford not to buy!"

Two farmers were talking over the outlook for this year. "I've just bought a new E-B plow," said one, "and I'm figuring on a new cultivator. Expect to place my order this week."

"What's the hurry?" asked the other. "Do you think this is a good time to buy?"

"Well, I thought at first I couldn't afford them, right now," said the first, "but when I began to think about profits this year I decided ***I couldn't afford NOT to buy.*** As I see it, there's only one way to be sure of a successful year—to plow and plant as many acres as I can take care of, and make every day count for bigger crops at less expense. That means better implements—tools I can depend on to save me time and do the work thoroughly. The old machines may have pulled me through last year, but they won't stand another season's use."

Can you afford to put off buying this year? It's worth thinking about seriously. Let your E-B dealer show you the time and labor-saving features in E-B tools. You'll see how they can help you farm more profitably.

RAISIN GROWERS START NEW CONTRACT CAMPAIGN

By Cultivator Staff Writer

"THE biggest idea in California today is the intelligent marketing of farm products, and tonight this idea hangs in the balance," were the words of President Wylie M. Giffen at the opening of the new contract campaign to perpetuate the California Associated Raisin Company, at a mass meeting of citizens of the Sacramento and San Joaquin Valleys which packed the great Fresno Auditorium to the very doors, on Monday night, February 7.

The meeting was perhaps one of the most cosmopolitan ever held in the state in that men and women representing practically every business and every nationality in the valley were present. Despite the cosmopolitan appearance of the gathering, all were there for a single purpose—to perpetuate the California Associated Raisin Company. The purpose of the meeting, as stated by R. L. Rogers, a large raisin grower and chairman of the meeting, was to offer the raisin growers of the state a new contract and to discuss it fairly, honestly and in temperate language, so that all might thoroughly understand its provisions. The new contracts had been placed in the mails by the raisin company, so that practically all of the growers present were familiar with its contents. Mr. Rogers advised every grower to sit down quietly at home and read the contract over carefully with his wife and family, and if there were any provisions which were not understood to go to their lawyer, banker or merchant or to their neighbors and discuss the provisions, and when understood fully, to sign at once and take it to the office of the company. He declared that there must be no lagging in this campaign and that all must do their share to prevent the return of the conditions in the raisin district prior to the organization of the growers. He quoted a grower as having stated to him that before the raisin company was organized a grower was a liability to the community, but that now the same grower was an asset.

President Giffen Explains New Contract

President Wylie M. Giffen of the Associated Raisin Company briefly explained the provisions of the new contract, after having dealt with the history of the raisin industry in the valley and with the history of the recent government suit to dissolve the company.

After Mr. Giffen's talk, Chase S. Osborne, president of the Fresno County chamber of commerce and publisher of the Fresno Republican and the Fresno Herald, spoke on the value of the association to the commuunity, Lloyd W. Wilbur, a grower from Sutter County, brought the message from the northern counties that the growers would stand back of the organization to the limit.

The Japanese growers, through their representative, promised 100 per cent support to the association, as did Madera, Kern and Kings Counties. Bankers, merchants, ministers, civic organizations from all parts of the two great valleys expressed their willingness to contribute their efforts toward the successful conclusion of the campaign, and when a very strong resolution was offered by W. B. Nichols, banker and raisin grower of Dinuba, indorsing the new contract and the management of the company, it was adopted unanimously in a round of applause.

The Contract

The new contract which is being offered to the growers by the raisin company is for 15 years and calls for the sale to the association of all the raisin grapes, dried currants and dried grapes of all varieties other than raisin grapes. The grower, however, is given the privilege of withdrawing from the company at the end of three years or, in the words of the contract, "The seller is hereby given the right to file with the buyer, between December 20 and December 31 of either of the years 1923, 1925, 1927, 1929, 1931 and 1933, a written notice of his desire to withdraw from this contract as to any or all of the varieties of raisins, dried currants and dried grapes covered thereby, and thereupon

said contract shall be cancelled as to the designated variety or varieties of the crops of that and succeeding years of the contract period.

The association guarantees a four cent price to the grower for all standard quality raisins six days after receipt of the goods and provides for the collection of three cents per pound as liquidated damages for breach of contract.

Before the close of the meeting Mr. Giffen asked the growers not to forget that the government had held in the recent suit that it had obtained its former contracts by undue persuasion and coercion and begged them to watch their step during the present campaign so that no man could say that such tactics had been resorted to in securing the new contracts.

THE GLENN COUNTY BUROC BREEDERS SALE

The annual sale of bred Duroc-Jersey sows and gilts, scheduled for January 24, by the Duroc breeders of Glenn County, was postponed on account of rain until Friday, February 4. The breeders consigning were satisfied with the $50 average they received. The top of sale was a two year old sow consigned by C. E. Bright and purchased by David Nelson, Redding, at $92.50. The next top was received by Hollingshead & Sons on a senior gilt purchased by B. J. Bills, Orland, at $75.

Missourians living in or visiting California will hold mid-winter picnic at Sycamore Grove, Los Angeles, Thursday, February 17.

Chop Out Extravagance From State Government!

It Was Done in Illinois!

It Should Be Done In California!

Will Governor Stephens lop off scores of useless high-salaried departments from the State's payroll, and consolidate essential ones?

The King excess tax bill now pending in the State Legislature proposes to arbitrarily boost the State's 1921-1922 tax budget from $47,000,000 to $81,000,000.

Even allowing $18,000,000 of this vast sum for school purposes, the proposed budget would still be $63,000,000, or around $16,000,000 more than last year's budget!

Governor Stephens and his friends in the California Legislature are fighting to have the Legislature pass this unjust and iniquitous measure when the Legislature resumes sessions, February 24th.

Will California's taxpayers, already grossly overburdened by taxes, stand for this tremendous boost in the State's budget to continue the administration's era of extravagance?

The King bill is ostensibly designed to tax the public utility corporations of the State. But when it is realized that the corporations merely pay taxes in a lump sum to the State and then collect them again from the public in turn, through added cost for service, the people—all the people—should demand the chopping off of wasteful expenditures of the people's money!

Governor Johnson's tax budget in 1915, for two years, was $36,000,000
Governor Stephens' tax budget for 1919, for two years, was $47,000,000

And now Governor Stephens and his high-salaried departments demand a total of $81,000,000 for state expenses in the next two years!

Will You Stand for It?

Or, will YOU write, 'phone or telegraph Governor Stephens and the legislators from YOUR district that YOU WILL NOT STAND FOR IT?

Demand Strict Economy, not Extravagance, in State Affairs!

It was done in Illinois where 125 useless departments were eliminated, saving many millions of dollars.

It can be done in California, if YOU DEMAND IT!

February in the Vegetable Garden

Southern California

By D. F. Reichard

DID you plan your spring and summer garden as suggested in the Cultivator's January calendar? If not, it would be a good idea to lay out some kind of a plan that will help you with your work. The main thing is to arrange your garden in rows so that it will be easy to care for. The rains of the last month have put the ground in fine shape for working. It is essential that this moisture be conserved now for the plants to use during the dry months that are to come. Have the garden plot all thoroughly worked, either plowed and harrowed or spaded and raked. If you are to have a permanent garden get your asparagus, rhubarb and artichoke roots in at the earliest possible moment as well as blackberries, loganberries, raspberries and other berries and fruit trees and vines.

It is a little early yet to plant beans, corn, melons and squash in most sections. There are, however, many warm slopes in Southern California where any or all of these more tender vegetables may be grown at this time with success. If there is any doubt as to your particular location confine your plantings during the first part of the month to the hardier vegetables. Make plantings of radishes, spinach seeds and lettuce plants. These will soon be ready to harvest and out of the way to make room for setting out late tomato, eggplant and pepper plants. If there is room put in potatoes and onion sets or seed. It is not advisable generally to plant peas after the last of this month so if a few good messes of this pleasing vegetable are wanted for next April and May you should get them planted during this month.

Plant carrots, beets, turnips, lettuce and parsnips for succession. Set out plants of cauliflower, cabbage and kale for late spring supply.

Watch the growing plants, see that they are thinned out so as to allow for proper development. Give your root vegetables four to six inches between each plant; lettuce should be a foot apart; spinach should be not closer than an inch or two. These distances give the plants opportunity, if properly fertilized and cared for, to make that quick but steady growth that produces the fine crisp vegetables we all appreciate.

Pruning of all dormant plants and trees should be attended to at once—before the sap begins to flow. Spray all plants and trees with Bordeaux mixture or lime-sulphur solution for prevention of fungus attacks. Apply of your seedman for a spraying calendar; they usually have these as compliments of spray pump manufacturers. A spray pump is something every gardener should have as there is use for it nearly every month in the year for controlling plant pests of some kind.

Northern California

By A. R. Gould

THE continued rains are encouraging to the gardener and should give us a very prosperous season. Now is the time to begin active work in the vegetable garden. Order your seeds from the most reliable seedsman and get the best and avoid waste of time. The question of manure will also arise, and remember that every time you take a crop off you have left the soil poorer, and if you expect good crops you must supply the plant food necessary by manuring. We consider farmyard manure the best and most lasting. However, there are also some very useful artificial fertilizers on the market, and these are sulphate of ammonia, dried blood and bone meal. Heavy clay or adobe soils will be the better for an application of lime. Give these points your careful consideration and prepare your soil for the coming season by deeply trenching the plots. Continue with successional sowings of seasonable crops.

Broad Beans and Canadian Wonder

The first named, sometimes known as the Horse bean, will need spraying no doubt for aphis or black fly, which can be destroyed by a solution of nicotine extract. The Canadian Wonder may be sown now in rows, two inches apart in the row, which should be two feet apart.

Carrots

Thin out those sown last month to four inches apart, and make a sowing of Chantenay, a fine early variety. Sow thinly in rows 18 inches apart, in rich soil.

Peas

Make successional sowings of the main crop, such varieties as Stratagem and Yorkshire Hero, Dwarf Telephone, also the edible pod Melting Sugar. Sow in rows two to three feet apart and keep the cultivator busy between the rows of those earlier sown, and be on the alert for aphis.

Onions

This crop will need cultivating and the earlier varieties will require thinning out and they may also be transplanted.

Lettuce

Sow for succession Los Angeles, Big Boston and White Paris Cos in well prepared soil very thinly, in rows 18 to 20 inches apart.

Turnips

Make a sowing of White Egg and Early Snowball in rich soil in rows two feet apart.

Beets

Sow Early Detroit and Improved Globe in rows 18 inches apart. Swiss chard or Sea Kale beet should also be sown for use as spinach.

Asparagus and Rhubarb

Established beds of these must be well top dressed with manure. Rhubarb roots may still be planted. The best varieties are Myatt's Victoria and Crimson Winter.

Berries

These are very profitable, and only the best varieties should be planted, a selection of which we gave in our notes last month. Keep the soil well cultivated between the rows and heavily manure any old established plots.

Parsley

Sow Moss Curled in rows very thinly in fairly rich soil.

Herbs

Secure plants of sage, thyme, chives, rosemary, sweet marjoram, and wormwood to plant out now.

Southern Arizona

By M. E. Bemis

FEBRUARY to the home gardener who is seeking to vary the monotony of gardening with as large a variety as possible, offers more inducement than possibly any other month in the year.

This is one of the most favorable months for the planting of the common garden vegetables such as beets, mustard, parlsey and turnips. The growth will be more rapid and the pleasures and profits of gardening will be greater. In the raising of beets

When writing advertisers, mention the Cultivator.

the Crosby's' Egyptian, Early Blood Turnip and Early Eclipse varieties are to be recommended; in carrots, Danver's Half Long, Improved Long Orange and the Oxheart are possibly the favorites. Spinach, while a little late for commercial crops, may be planted for the home garden. The same is true of lettuce. Potatoes may be safely planted in February. Of the varieties which have been proven to do well let me mention the Arizona Red, Irish Cobbler, Early Triumph, Early White Rose and Peerless. Potatoes require a light and extremely rich soil, and the land should be thoroughly plowed and the seedbed made extremely fine. The best success has been had in Southern Arizona where the ground is thoroughly saturated with water before planting or where there is natural sub-irrigation. Water should be withheld until the top growth is well established and the tubers are formed. Three feet apart is a good distance for the rows. Potatoes should be cut with one to two eyes to the piece and planted 12 to 14 inches apart in the row, covering to a depth of three or four inches. If planted in furrows and the earth gradually drawn to the plants as they mature this will result in leveling the surface and later slightly ridging it, making a natural channel for irrigation water between the rows. Potatoes planted in February ought to mature in May or June before the extremely hot weather begins.

Sweet potatoes, for growing the slips, should be bedded at this season. With the small gardener, however, it is far cheaper and saves a lot of worry to buy the slips later, say the latter part of March or April at the time when they should be put into the ground. It is not too late to plant the wrinkled varieties of peas. The Yorkshire Hero is one of the favorite varieties in Phoenix and the Salt River Valley. The Gradus is also a pea of rapid growth and the Stratagem is a favorite in the Phoenix markets.

Bush squash may be planted the latter part of February. These make a rapid growth and are frequently on the market before the inexperienced gardener thinks it is time to plant them. The White Bush Early and the White Bush Scallop are the earliest maturing varieties. The Summer Crookedneck comes on a little later.

Tomatoes may be started in the hot beds or in small boxes in the house. The Royal Red produces heavily under Arizona climatic conditions and has a heavy foliage which protects the fruit from the intense heat in the summer. These tomatoes are large and smooth. The Phoenix Special is a bright purple scarlet. It is extremely productive and quite early. This also has a heavy foliage. The Dwarf Stone, Dwarf Champion and Chalk's Early Jewel have been favorites here for many years. Tomatoes are not grown for commercial use to as large an extent as in many communities, owing principally to the fact that we have no large canneries to take care of the surplus, and shipments to distant markets are attended with some difficulties.

Onion sets and asparagus roots should be planted in February. An onion grower at Benson has had remarkable success in growing the Valencia onion. Seed for this are planted in July or early August and the plants transplanted in February. These are planted in rows 16 inches apart and the onion sets six inches apart in the row.

THE TELEMEGAPHONE

The human voice may now be clearly heard by an audience of 150,000 people. A device known as the telemegaphone transmits the words of a speaker so that they can be easily heard in the open air for a distance of 600 feet. A series of telephone receivers are placed near the speaker pointing towards him from every angle, so that no matter which way he may turn his voice is certain to be caught. The receivers in turn are transmitted to points amid the audience and thrown out simultaneously in five directions. A device similar to the megaphone magnifies the sound, while keeping the enunciation clear and distinct.—Boys Life.

The Bean Giant at work in 600-acre Baker-Langdon Orchards at Walla Walla, Washington.

The "Bean" Giant
for *Large Capacity* and *High Pressure*

IN large orchards where they have to cover the ground quickly—where High Pressure and Large Capacity are absolutely necessary—the Bean is the universal choice.

The Bean Giant shown above supplies several lines of hose, delivers from 5½ to 10 gallons a minute, and drives the material onto the trees at tremendous pressure in the form of a dense, penetrating, saturating mist which reaches every crack and crevice.

Bean Large Capacity and High Pressure are the result of these features—

—BEAN UNDERNEATH SUCTION allows the liquid to flow from the tank to the pump without help from the engine.

—BEAN DIRECT-GEAR CONNECTION prevents loss of power thru belt slippage.

—These advantages together with BEAN SMOOTH PORCELAIN CYLINDERS and BEAN ECCENTRICS (used instead of cranks) so reduce friction and save power that a Bean Sprayer will throw more liquid than any other outfit with the same size engine.

It is a well established fact that you can throw as much liquid with a Bean two-cylinder outfit as with most three-cylinder machines.

Send the Coupon for New Bean Catalog—It illustrates and describes the entire Bean line of Hand and Power Sprayers, and explains in detail the many distinctive Bean advantages. Write for your copy—now.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Correspondence School

Is there any school or college in California that teaches construction of evaporators and the drying of fruit by evaporation? I would be interested in a course that would fit me to contract the building of evaporators. If there is no school in California is there any school that has correspondence courses?—Subscriber.

We do not think there are any special courses given in construction of evaporators. However, that is a question which has been thoroughly studied by Prof. Cruess and his helpers in the University of California. The effort to conserve our fruits has been encouraged by the university by sending specialists to make demonstrations and even construct evaporators for communities, therefore would suggest that our inquirer write Prof. W. V. Cruess, University of California, Berkeley. The university offers many different correspondence courses, as does the University of Southern California. There appeared in the Cultivator of June 19, 1920, on page 977 an excellent illustrated article written by Prof. W. V. Cruess which may be of interest to the inquirer.

Scale on Asparagus

Will you kindly tell me what kind of spray to use or other means of ridding my asparagus sprengeri of rose scale. I have cut off and burned the infested parts, leaving only the young shoots which had not become infested, several times, but as this process greatly diminishes the beauty

AVERY

SIX-CYLINDER TRACTORS

Ready for All-Around Work On Any Size Farm

Study the work of this little tractor. See whether it does not give you the logical, practical answer to the power problem on your farm. We sincerely believe it to be the biggest success ever offered in a small tractor.

Here's dependable power in small size—quality construction at low cost—a complete power plant that can put speed and economy into practically any kind of farm work.

It can be used profitably on any size farm. Besides plowing you can hitch it to your disc harrow, grain drill, mower, binder, manure spreader or other machines and finish your work in much less time and at lower cost than with animal power. Also runs a small thresher, silo filler and other belt machinery.

One owner says: "We have never required the service of any of your service men and the little tractor has never refused to go. We are pulling what we consider a good six-horse load and seem to have plenty of reserve power."

It is built complete in the Avery factories. Has a 6-cylinder motor with extra strong crankshaft and connecting rods. Also centrifugal governor entirely enclosed running in oil, high tension magneto, thermo-siphon cooling system, selective sliding transmission, and is roller and ball bearing equipped. Platform, seat, tool box, drawbar, air cleaner, etc., are regular equipment.

Write for special circular describing this small tractor and also Avery Model "B" 5-10 H. P. Or

FRESNO CALIFORNIA

of the plant I would like to find some other effective method of destroying the pest. The plant is attacked every fall or winter but has remained free from scale during the remainder of the season after removing all the old branches which had scale on them.—Subscriber, Watsonville.

The rose scale, Diaspis (Aulacaspis) rosae, is very easily controlled on rose bushes, berry plants, etc., by lime-sulphur spray or by a simple soap spray. One pound of whale oil or other good soap in a gallon of water may be a better material for ornamentals as it is less unsightly than lime-sulphur.

Sour Pot Soil

What shall I do to keep soil in flower pots sweet? If I keep the soil as damp as it should be it soon smells sour. Is there not something I can put in to sweeten the soil and not injure the plants?—Subscriber, Escondido.

Such condition suggests poor drainage but relief may be afforded by application of lime water. Put a lump of lime in a vessel of water, stir it until it slakes, let water settle until clear and use this to water soil. The water will not hold enough lime in solution to be injurious to plant life no matter how thick the original mixture. It may be placed in bottles, tightly corked, and used occasionally. But see that potted soils are well drained.

Tree Whitewash

Please give me the formula for whitewashing the butts of fruit trees —Subscriber, San Fernando.

We assume the subscriber is asking as to a covering for large wounds made in trees. Whitewash is sometimes used for this purpose but is not as permament as paint. Another column of this issue gives formula for making whitewash. White lead and oil paint applied rather thickly is good but one should use care not to allow the oil to run down over the bark. On the cut surface it does no injury. The ordinary grafting wax and asphaltum are often used.

Avocados—Mangoes

Is the avocado the same fruit as the mango in the Phillipines? — Subscriber, Live Oak.

No, these two are entirely distinct fruits. Both are grown in California, but as yet the mango has not become in this state a commercial fruit. There are thousands of avocado trees, however, and every day of the year finds avocados in all of our larger markets.

Rebudding Orange Trees

I have a ten year old Valencia orange tree that I want to bud or graft to a Washington Navel if feasible. Please tell me which would be best and just how and when to do it. Or would it be best to dig out the old tree and plant a new one? — Subscriber.

Unless one understands budding and making over the tree or is able to secure one qualified to handle the case we believe it would be better to remove and plant new vigorous trees. The working over of older trees calls for considerable experience and as there are more or less of misses in rebudding it is hard to secure a uniform tree.

Oranges and Lemons for Fertilizer

To settle an argument will you please give your opinion on the following. I hold that oranges and lemons unsold make fine fertilizer; my friend is afraid of them.—Subscriber, Compton.

Personally the writer would be glad to have either oranges or lemons dumped on the orchard soil and would plow them in expecting the decay to care for any acids in the fruit. We know of a case at Pomona where in 1913 frozen oranges were dumped nearly a foot thick to test effect on acid in the soil. About the only difference noted in this section was that the soil was in rather better condition where the fruit had been allowed to rot than where no fruit had been used. As the decaying of a potato or sugar beet destroys the starch and sugar content so the decaying of a citrus fruit destroys the citric acid. There is, however, but little fertilizing value in the fruit so that one would not care to pay any material sum for it to use as a fertilizer. The bulk is too great compared with the fertility content.

The contemplated Kern irrigation district plans impounding and conservation which will permit irrigation of 292,000 acres. It is estimated it will cost about $65 per acre.

LINCOLN

We worship heroes only when they're dead.
In life we stone or censure or neglect.
We know them not till over them is shed
The tinsel halo of a world's respect.
And thus it was with Lincoln. He was decked
In such a homely semblance that the race
Of human jackdaws at his great name pecked
And shrilled derision at his grief worn face.
It needed a new age to find his rightful place.

The modern Pharisees, the slaves of form,
The Mammon worshipers, the self-deemed wise,
Saw not his mighty heart with man-love warm,
Nor the great soul behind his patient eyes.
These never know a prophet till he dies—
Not even then unless the world's acclaim
Distends his figure to gigantic size
And so creates a fashion of his fame.
Then the lip servers come with tributes to his name.

Yet this, too, is a blessing—that the good
In him so soon has overcome dispraise;
That he is known and loved and understood
Who was misrepresented all his days.
It teaches us that Truth has power to raise
Her standard far aloft for all to see
And that so fair she is the whole world's gaze
Returns to her throughout the years to be.
Thus all the Truth at last all men shall render free.

Four qualities did Lincoln body forth.
The first was this same truth, in him so strong
He sought it as the needle seeks the north;
It would not let him advocate the Wrong.
The second was his faith. Through all the long,
Dark years he felt at last would come the light.
Beneath the sorrow in his heart a song
Sang ever of the triumph of the right.
He held to God, the source of every great soul's might.

His third strength was simplicity. He sought
The heart of every question, stripped it free
Of all confusions, then in clearest thought
And plainest speech he made all men to see.
His last great force was love. In mercy he
Outstripped all men this stern old world has seen
Since One who taught and wept in Galilee.
Between these two no love like theirs has been,
And this it is which keeps their memories so green.—James A. Edgerton.

LINCOLN'S BIRTHDAY

Today, February 12, is Abraham Lincoln's birthday, a day that means as much to us now as February 22, which we honor as the birthday of our first president, George Washington.

Lincoln was as intolerant of hazy, indirect speech as he was of hazy, indirect action. Here are quotations from some of his utterances which show the characteristic clarity of his expression—and vision:

"That this nation, under God, shall have a new birth of freedom and that government of the people, by the people, for the people, shall not perish from the earth."

"With malice toward none, with charity for all, with firmness in the right, as God gives us to see the right."

This is said about strong drink:

"Do not put an enemy in your mouth to steal away your brains."

"Temporizing will do no longer; now is the time for decision, for firm, persistent, resolute decision."

"You must not expect me to give up this government without playing my last card."

"You stand on middle ground and hold the ship level and steady."

"This Union shall never be abandoned unless the possibility of its existence shall cease to exist without the necessity of throwing passengers and cargo overboard."

"Broken eggs can never be mended, and the longer the breaking proceeds the more will be broken."

"The ballot is stronger than bullets."

"Perhaps a man's character is like a tree and his reputation like its shadow. The shadow is what we think of it; the tree is the real thing.

"And having thus chosen our course, without guile and with pure purpose, let us renew our trust in God and go forward without fear and with manly hearts."

"I have not suffered by the South. I have suffered with the South."

"A rat in the larder is easier to catch than a rat that has the run of the cellar."

TO SWEETEN RANCID LARD

Quick and generous response has come from Cultivator housekeepers to request on the household page of January 29 for practical means of sweetening rancid lard. All suggest cooking ing potatoes in the lard, and we give a number of the letters, each of which makes some one point in distinction from the others.

Let Chickens Eat the Potatoes

If Subscriber, Napa, will heat her rancid lard quite hot and fry thinly sliced potatoes therein (about one medium sized potato to one quart melted lard), then strain and set lard in cool place, she will find it sweet as when newly made. And the potatoes—well, the chickens and cats will relish those more than will the family!—Mrs. E. N. C., El Centro.

To Sweeten Butter Also

If "Napa Subscriber" will peel and slice about four good sized raw Irish potatoes in her 20 pounds of rancid lard and cook it for about 20 minutes or half an hour, it will sweeten it, if the lard is not too old. She might try a small quantity first with one potato, and if it did not absorb all the rancidity, take it out and put in a fresh potato and cook again. Carrots will answer the same purpose.

To sweeten butter that has become too strong for table use, soak it over night in sweet milk, being careful to work the milk thoroughly into the butter, and wash out in the morning with cold water.—Subscriber, Del Mar.

"Busy Grease Never Burns"

Our Napa subscriber will have to apply our grandmother's remedy for the rancid lard. Heat it very hot. There was method in our grandmothers' way of putting in a few slices of ptotato, as "busy" grease never burns and the potato slices keep it busy so it may be heated very hot without burning. If I were doing it I should divide it in four measures and do one at a time.—Cultivator Reader, Wasco.

Don't Burn the Lard

In regard to keeping the lard fresh, tell your correspondent that if she will heat up her lard and fry a potato (sliced thin) in it, being careful not to burn it, she will find her lard freshened.—Subscriber, Anaheim.

Doughnuts from Restored Lard

I read the request of "How to Sweeten Lard" in today's paper and will give you my remedy for it. If you haven't already received a better recipe it may help the Napa subscriber. Heat the lard and slice in raw potato. Cook until the potato is quite brown. Adding pieces of charcoal to the lard and boiling will also sweeten. After your lard is ready the following doughnut recipe is fine: 1 cup sugar, 1 large egg, 1 tablespoon melted butter or Crisco, salt and nutmeg to taste and one-fourth teaspoon ginger (prevents soaking lard). Beat all together and add 1 cup milk, 2 teaspoons baking powder, and flour to make a soft dough. Fry in hot lard and roll in sugar.—Bakersfield Subscriber.

McGUFFEY'S FIFTH READER

The household department had requests for information as to making yeast and sweetening lard and loyal household readers came back so liberally that we have no space for McGuffey and readings of other days. The next installment, however, will consist of "The Last Sigh of the Moor" and "Impeachment of Warren Hastings."

The Cultivator Patterns

BE SURE TO SEND SIZE

3492. Ladies' Dress.—Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 5⅝ yards of 40 inch material. The width of the skirt at its lower edge is 2 yards. Price 10 cents.

3466. Girls' Dress.—Cut in 4 sizes: 8, 10, 12 and 14 years. A 14 year size will require 4¼ yards of 44 inch material. Price 10 cents.

3468. A Popular Apron Dress.—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42, and Extra Large, 44-46 inches bust measure. The width of the skirt at lower edge is 2 yards. A Medium size will require 6 yards of 36 inch material. Price 10 cents.

3331. Girls' Dress.—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size will require 4⅝ yards of 36 inch material. Price 10 cents.

3489-3474. Ladies' Costume.—Waist 3489 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3474 cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress for a medium size will require 4 yards of figured and 2½ yards of plain material 44 inches wide. The width of the skirt at the foot is 2 yards. TWO separate patterns, 10 cents FOR EACH pattern.

3480. Girls' Dress.—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size requires 3¼ yards of 38 inch material. Price 10 cents.

3476. Ladies' House Gown.—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; Extra Large, 44-46 inches bust measure. A Medium size will require 5¼ yards of 36 inch material. The width at lower edge is 2 yards. Price 10 cents.

3481. Girls' "Under Waist and Knickers."—Cut in 5 sizes: 4, 6, 8, 10 and 12 years. A 10 year size will require 2⅝ yards of 36 inch material. Price 10 cents.

CATALOGUE NOTICE

Send 15c in silver or stamps for our UP-TO-DATE SPRING AND SUMMER 1921 CATALOGUE, containing over 500 designs of Ladies', Misses' and Children's Patterns, a CONCISE AND COMPREHENSIVE ARTICLE ON DRESS-MAKING, ALSO SOME POINTS FOR THE NEEDLE (illustrating 30 of the various simple stitches), all valuable to the home dressmaker.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK**. Therefore, we promise to deliver all patterns ordered within **TWO WEKS**; we guarantee safe delivery of all patterns. Address

Strain Through Cloth

In answer to an inquiry in this column about how to sweeten rancid lard, will say if the subscriber will heat the lard and slice one medium sized potato to every two pounds of lard and let potatoes fry light brown and until tender through, the lard will be sweet and fresh. Strain through cloth into container.—Subscriber, San Bernardino.

Cover With Paraffin

In Cultivator of January 29 Subscriber, Napa, asks how to sweeten rancid lard. If she will melt slowly, then to each pound of lard add a good sized Irish potato, sliced thinly, and cook slowly for 30 minutes or more the lard will be as sweet as new. Throw away potatoes and put lard in small containers and cover with paraffine and it will keep sweet. The same treatment will make rancid butter sweet so it can be used for cooking. This is absolutely reliable, as I have used it on both butter and lard many times and with perfect results. —P. I. W., El Monte.

With Apple and Water

To sweeten rancid lard, put in a cup of water and a large apple and cook it until the water is all cooked away. You will have sweet lard.—Paula Walker, Wasco.

Same Treatment Improves Beef Fat

If the party who has the rancid lard will cook it over and slice in a quantity of potato I think she will find her lard fit for use. By the time the potato is cooked brown it has absorbed the strong taste of the lard. If beef fat is treated the same it is much nicer for cooking.—Mrs. J. T. Flynn, Redlands.

Skim and Strain

Answering request in the household queries in the Cultivator of January 29 on how to restore rancid lard:

To sweeten lard melt and to every three quarts add one piece stale bread, one onion, one raw potato, one apple, the potatoes and apples with skin on. Boil slowly 20 minutes, skim and strain into clean containers. Store in cool place.—Mrs. Carl Froberg, El Cajon.

Render Fresh Fat

In answer to question of Napa subscriber in January 29 Cultivator the method I use in freshening rancid lard is to take about four pounds either beef or pork fat, prepared to render out. The fat is added to the rancid lard, fried until cracklings are brown, then strained off in the usual way. The cracklings carry off the rancid taste. This sweetens ten pounds of rancid lard. — Mrs. W. F. Doemsky, Gonzales.

HOME MADE YEAST

Making Yeast Without Starter

For the benefit of the mountain subscriber I herewith enclose my recipe for making yeast cakes which I have used and found good:

Stir into a pint of good lively yeast a tablespoon of salt, and rye or wheat flour to make a thick batter. When risen, stir in corn meal till of the right consistency to roll out. When risen again, roll them out very thin, cut them into cakes with a tumbler and dry them, in summer time, in the shade in clear windy weather. In winter time dry them in moderate warm room. When perfectly dry, tie them up in a bag and keep them in a cool dry place. One of these cakes dissolved in a little lukewarm water will make four or five loaves of bread or one cake can be used for potato yeast starter.—Subscriber, Neenach.

Grandmother's Way

I am sending a recipe for home made yeast that my grandmother and my mother both used: When boiling potatoes for dinner reserve the water they are boiled in, mashing one potato fine and adding it to water. Have ready a bowl with a tablespoonful of salt, one of sugar and about a cup of sifted flour. Pour the potato water gradually over this, stirring all the while, and set aside to cool. When nearly cold stir into it two cakes of magic yeast which has been soaked in sufficient water to make it very soft and set in a warm place to work. Keep in a cool place, freshening it now and then by adding more potato water with salt, sugar and flour.—O. F. S., Verona.

Homemade Potato Yeast

In the issue of the California Cultivator for January 29, page 145, you ask for a recipe for homemade potato yeast which is desired by a mountain subscriber. I take pleasure in sending you the following recipe used for several years while living in the Adirondack mountains. I have never had better bread than was made with this yeast as a wetting and can heartily recommend it.

Peel a dozen large potatoes and put on to cook in three quarts of slightly salted water. While they are cooking mix well together one pint of flour, half a pint each of salt and sugar and add sufficient cold water to make a thin paste, stirring until smooth. Add two quarts of boiling water, stir and cook until it thickens and is clear. As soon as tender press the potatoes through a sieve or ricer directly into this cooked mixture, stir and add the water in which they were boiled. Strain into a two gallon crock; let stand until lukewarm, then add four yeast cakes (magic) which have been soaled in tepid water until dissolved. Add more warm water, if necessary, to fill the crock to within four inches of the top. When frothy and light, stir down once. When it rises a second time, cover and set away in a cooler or any cool place.

Use this yeast as the sole wetting for the bread. One quart of yeast with three quarts of flour will make two large or three small loaves.

Quick Yeast in Summer

At noon put one yeast cake to soak in one-half cup warm water. Place where it will keep warm. A double boiler would be excellent. In the evening cook two large potatoes, drain and mash, then return to the water in which they were cooked. When cool add 1 teaspoon salt, 1 tablespoon sugar ½ teaspoon ginger and the soaked yeast cake. Keep in a warm place for 36 hours. It will be beautifully light. I use this to make my bread. The climatic conditions greatly affect yeast and bread making. During the hot summer months this yeast is up light and fine the first morning after it is made. Winter months require a longer time.—One of the Cultivator's Housewives.

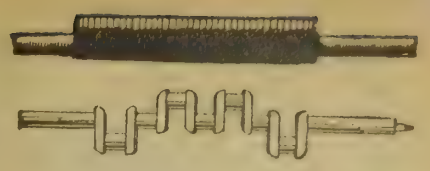
Everlasting Yeast and Bread Recipe

In answer to mountain subscriber in regard to everlasting yeast: 1 cup mashed potatoes, 1 cup warm water, ½ cup sugar, ½ teaspoon salt, 1 yeast cake, preferably yeast foam. Dissolve yeast cake in the water, add the other ingredients and enough flour to be easily stirred with a spoon. Set in a warm place to rise for about 12 hours. It should then be ready for use. When wanted for bread take 1 cup mashed potatoes, 2 cups warm water ½ cup sugar, ½ the everlasting yeast previously prepared, thicken with flour and beat it smooth with a heavy spoon and set in a warm place over night. In the morning sift flour in mixing bowl, add 1 teaspoon salt and yeast and just enough warm water to rinse out the yeast container, mix to a stiff dough, knead well, set in a warm place to raise. When twice its former size, work down and when dough is raised the second time mold into loaves and put into baking pan and again let rise to double size and bake in slow oven for about one hour. If these directions are strictly followed and the bread is not good, the fault is with the flour.

In addition I would say to mountain subscriber: To the remaining ½ of the everlasting yeast add ½ cup each of water, sugar and flour and set in a cool place till wanted again. stir well.—Mrs. F. M. Hubbell, Woodland.

Fresh Yeast for Each Batch of Bread

Homemade Yeast—When I plan to bake bread I use the water in which I have boiled potatoes for a meal. Drain the potatoes and set the water aside to cool. When blood warm add 1 tablespoon of sugar and 1 cup of starter or 1 yeast cake and set to rise. I make fresh yeast for each new batch of bread and use equal measure of this yeast and warm water or milk. I save one cup of starter for the next time—Mrs. G. H. Williams, Petaluma.



Thousandth-of-an-inch Limits

Making the crankshaft of the "Caterpillar" Tractor is an exacting series of operations. The drop-forging of special composition steel is first machined, then carefully ground to size. The work must be exact as to diameter, roundness, length and parallelism to one-thousandth of an inch. This accuracy insures long life and perfect service.

OILPULL
ADVANCE-RUMELY THRESHER COMPANY, INC.
Certificate of Guarantee
We guarantee each Rumely OilPull Tractor to burn successfully all grades of kerosene permitted by law to be sold in the United States and Canada, under all conditions, at all loads up to its rated brake horse power.
This is to certify that Rumely OilPull Tractor Number 10792 Type 20-40
purchased by Chas. E. Thomas of Miamisburg, Ohio
is protected by the above warranty.
In Witness Whereof we, the duly authorized officers of the Corporation, have hereunto subscribed our names and caused the corporate seal to be affixed this 15th day of November 1920.
NEW YORK
1915

NO other tractor is backed by a guarantee such as this—to burn kerosene under all conditions, at all loads up to its full rated brake horse power.

The success of the OilPull as a cheap fuel tractor is due to more than just the Secor-Higgins carburetor, patented and used only by the Advance-Rumely Company. Every part is built especially for the successful burning of oil fuels—special motor, carburetor, cooling system. The method of handling kerosene is so different from that of gasoline that it necessitates entirely different construction of the entire machine.

The result is that no matter whether in drawbar or belt work, running at full load or light, in wet weather or dry, coldest winter or hottest summer, any time, any place—cheap kerosene is the OilPull's fuel.

The records of public contests prove its ability to plow an acre *at the lowest cost* and to use the *least fuel per horse power.*

If there isn't an OilPull dealer in your town, have us send full details.

Yeast and Quickly Made Bread

As early as possible in the morning put two yeast cakes in a little water to soak. Take two tablespoons of salt, two of sugar and three of flour. Put in a basin and pour over it one pint of boiling water. When cool enough put in the soaked yeast cake and let rise until noon. Boil 12 large potatoes and rub through a sieve or colander. Pour over them one quart boiling and one of cold water. When lukewarm add the prepared yeast and let stand over night; afterwards cover tightly and keep in a cool place. One pint makes one loaf of bread. Mix hard, mold well and put directly into the baking tins. To make nice shape, after it is ready for the tins, melt grease and grease the loaf all over instead of greasing the tins. This will prevent cracking open. It should be pressed flat in the pans, so that it will rise as much on the sides as in the center. Give close attention to the baking. This method obviates starting the bread over night, for in using the yeast for the only moistening the bread will be ready for the table in about two hours It will be found especially convenient for fresh rolls.—Subscriber Anaheim.

Starter

As I was reading the Cultivator I noticed Mountain Subscriber asked the best way of making homemade yeast. This is what I found to be excellent. I call this a "Starter":

Take four good sized potatoes and two quarts water. Cook, then mash fine and add three tablespoons sugar, one dry yeast cake. Start this at noon and in the evening take out one quart and seal in jar and save for next time. Do not add salt to this. Now take the balance of this and add one-half cup of shortening, one heaping teaspoon salt, one pint of warm water and two cups flour or little more, according to the amount of bread wanted. Let stand covered until morning. Mix stiff. This will make four or more loaves bread.—M. F. B., Paw Paw, Illinois.

Buttermilk Dry Yeast

One pint of buttermilk, ¼ cup sugar; ½ cup flour made smooth with cold buttermilk while the first two ingredients are boiling. Stir in the flour and cook well. When it is cool add a cake of magic yeast which has been softened by soaking in water, then when it works and is light, stiffen with corn meal and make into cakes and let dry. One-fourth of cup will make three large loaves. It keeps longer than any other yeast.—Mary L. Hootman, Puente.

Starter

One cake magic yeast soaked in one pint of lukewarm water for one hour. Then add two tablespoons sugar and three of flour and let rise. Cook three good sized potatoes and mash well, adding two tablespoons sugar, with one quart of potato water lukewarm. Mix both together in evening and let it rise over night. Can keep a starter from the above recipe by keeping out one-half pint. When ready for next baking add two tablespoons of sugar, three of flour and one-half pint of water.—Subscriber, Tracy.

Homemade Yeast

Dry yeast 1 package, potatoes (medium) 6, water 3 quarts, flour 4 heaping teaspoons, sugar 4 level teaspoons. Break up dry yeast and put to soak in one pint lukewarm water. Wash and dice potatoes into one inch cubes (do not peel, as peelings contain many activating agents). Put potatoes and three quarts water to boil. Put flour and sugar into six quart or two gallon earthenware jar. Pour well boiled potatoes (water and all) over contents in jar. Mash and stir thoroughly. Set aside to cool. When cooled to bear hand, use hands (clean) to break up all particles and lumps (the finer the better). Add and stir in the dissolved yeast. Cover jar with clean cloth and set in cool place. In 12 to 14 hours it is ready for use. Strain yeast as used. Use one cup liquid yeast where you would one cake dry yeast. To replenish jar of yeast after using out of it once or twice, add 1 teaspoon sugar, 1 tablespoon flour and each week one boiled potato mashed, also water potatoes have been boiled in. In this way this yeast is lively and good for a month or more. This recipe can be reduced or doubled to suit size of family.—S. F. Steendahl, Los Altos.

$7.50 = After 30 Days Free Trial

Easy Now to Saw Logs and Cut Down Trees

Only one man, or even a boy, with the improved Ottawa Engine Log Saw can easily cut twenty-five to forty cords a day, and at a cost of less than 2c per cord. This machine, which outdoes all others, has a heavy, cross cut saw driven by a powerful especially designed 4-cycle gasoline engine. It's a fast money-maker for those using it and now with coal at high prices and wood in great demand, users are making splendid profit. It does more than ten men could do, either cutting down trees or sawing logs and branches. When not sawing, the engine is used for other work requiring dependable power.

Patent Applied For

Farmers everywhere are using this One-Man Power Log Saw. It's a fast worker and a splendid profit maker.

The machine is mounted on truck wheels to make it easy to move to the trees or logs, and from cut to cut on a log **without stopping the engine.** This is a patented feature. A friction clutch starts and stops saw without stopping the engine. An automatic clutch stops the saw in case of undue resistance.

The Ottawa is also fitted for sawing down trees. It cuts level with the ground, leaving no stumps sticking up. Two men can easily fall forty to fifty trees a day in ordinary timber. A branch saw attachment cuts up branches and poles.

The outfit is compact, simple, easy to handle and durable against a lifetime of hard wear. Guaranteed for reliable operation in the hands of every one who has trees to cut down and logs to saw up.

Full information, low factory price, cash or easy payments, and thirty days trial offer can be had simply by addressing the Ottawa Mfg. Co., 2744 Wood St., Ottawa, Kansas.

TWO BIG DUROC DAYS

Do not forget February 16 and 17, for they will be great days in Duroc circles in Southern California. On the 16th the Diamond Bar Ranch at Spadra will sell 35 of the best sows and gilts they could pick out of their big herd. These will include daughters of Pathfinder and of his sons, Great Pathfinder and Ace of Pathfinders, along with daughters of other great boars. They are all bred to the Ace or to the other great herd boars, Mammoth Sensation and Diamond Sensation, who is by Great Orion Sensation, the world's grand champion boar.

On the 17th the Falfadale Farm at Perris will disperse its fine herd of sows, all of which will be bred to Great Orion Sensation Junior, the grand champion boar at Tulare, Los Angeles, and Riverside. The grand champion will also be sold and he is the best Duroc boar ever sold at auction in this state. A young boar, Orion Pathfinder, by the Ace and out of J. P. Walker's great $1,500 sow, will also be included in the sale. Both sales will be under cover and a big time is expected at each.

THE JAS. J. JEFFRIES SALE

The dispersal of the Jas. J. Jeffries herd of registered Holsteins attracted a crowd of over 1,500 people and resulted in a most successful sale, with no really sensational prices considering the quality of cattle offered. A general summary of the sale shows that the 28 females of milking age averaged $1,246; 10 bred heifers averaged $528; 15 open heifers and heifer calves averaged $404; one herd bull sold for $4,300; three young bulls averaged $933; five reactor cows and heifers averaged $371. The entire 62 head catalogued sold for an average of $888.

A new top price for a Holstein female at public sale in California was registered when De Kol Pet Segis went to Fred Hartsook, Lankershim, for $4,500.

THE W. A. THOMPSON DISPERSAL

In the W. A. Thompson dispersal of registered Holsteins at Hynes on February 5, the females averaged $337, bull calves $137. Two females reached $800 each. Detailed report will appear next week.

"Red Top" Steel Fence Posts

will be exhibited at the Eleventh National Orange Show, San Bernardino

Booth 3
Section B

The exhibit will be in charge of Mr. A. A. Farnsworth, field operator, who will explain in detail the merits of

A healthy Holstein, this. She is a 3-year-old junior champion, with a seven-day score of 581 pounds milk; 29.3 lbs. butter fat.

Keeping Tabs on Health Pays

THE whole scheme of profitable dairying leads back to the subject of health. No way of escaping it. A cow is profitable or not, according to the degree of vigor of her milk-making organs.

Watch the milk-yield closely; it's the barometer of health. Reduced milk-flow means the presence or approach of disease.

Each year more thousands of dairy farmers are learning the value of the simple Kow-Kare home treatment—both as a preventive and reliable aid in relieving diseases of the genital and digestive organs. Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches can be kept out of your dairy with the aid of this great cow medicine.

Give Kow-Kare a trial; feed dealers, druggists and general stores sell it—70c and $1.40 packages. Write for free book, "The Home Cow Doctor."

DAIRY ASSOCIATION COMPANY
Lyndonville, Vermont

NOTE: The trade-mark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of both the PREVENTIVE and CURATIVE qualities of the remedy. There is not the slightest change in formula or manufacture.
